THE third annual exhibition of works of the French School contains, as last year, a considerable proportion of small figure pictures, elegant in their tone of subject, and exquisite in execution. These constitute the strength of the collection. Their quality far surpasses that of the landscapes or of the more ambitious classes of composition. The artists who excel in this kind of subject are the Molières, the Corneilles, of their school: there is a grace in their conceptions which renders them always agreeable objects of contemplation—we mix with pleasure in their *causeries* and *coteries*, because their reunions are in the best taste of the dramatic masters whom they follow. These little pictures are very highly elaborated; but all finish in them is effected with softness, while among ourselves hardness seems an inevitable result of elaboration. Compared with these *pièces de société*, all the other figure compositions are unattractive. French landscape is undoubtedly mannered—low tone is the prevalent taste, and there is a single-mindedness in the execution which gives the French productions generally of this department the appearance of having emanated from one studio. This may be only the usual resemblance between relatives descended from one stock, but there is more of identity in the family likeness than we see elsewhere. The trees do not display masterly knowledge, and the foliage is generally very loosely painted. We have seen here examples of Ingres and Vernet; but there is in the present collection no work by either of these distinguished men. By DELAROCHE there is the well-known picture 'Napoleon Crossing the Alps,' and by ARY SCHEFFER, an equally well-known composition, 'The Three Marys.' It is gratifying to see these works which have been so long familiar to us through engravings. MADLLE. ROSA BONHEUR exhibits three small works—No. 45, 'Landscape, with Cattle,' a small picture, low in tone, representing a breadth of pasturage with a group of cattle. No. 46, 'An Auvergne Peasant,' a study of a man holding an ox by the horn, as if to be painted; this seems to have been studied for another picture. No. 47 is a sketch of a horse, made perhaps with the same intention. Over the fire-place is a row of these small gem-like works, of which we have spoken. No. 90, 'The Casket,' VICTOR CHAVEL, shows a group of two female figures, one standing and the other seated, the former holding the casket; they are in a bed-room. No. 263, 'A Young Girl selecting Fruit,' is by PLASSAN. The figure is erect, and extending her hand to a sideboard, whence she is about to take a pear: remarkable for softness of execution. Plassan exhibits two other works. No. 237, 'A Lover of the Weed,' by MEISSONIER, is a charmingly wrought miniature in oil; it represents a man seated smoking, with a small can of beer by him; the finish of this work cannot be surpassed. We remember a similar figure some years ago by the same painter, but the man then wore his hat. No. 88, 'The Honey-moon,' by CHAVER, is fine in quality, but he has produced better works. No. 35, 'The Breakfast,' by BILLOTTE, consists of one figure, that of a lady, seated at her breakfast-table, conversing with her parrot; an agreeable composition, but somewhat harder than others above mentioned. No. 58, 'Haystacks on Fire at Midday,' is a large picture by BRETON—the fact of the fire is clearly stated; but in the numerous figures there is a want of energy and spirit—many are very skilfully drawn and lighted, but they will never subdue the fire. No. 162, 'Fishing Boats on the Dutch Coast,' by GUDIN, presents a certain effect of light which this artist often paints. M. Gudin enjoys a high reputation as a marine painter in France, but his water wants volume and breadth, and his skies descriptive power. No. 201, 'A Cottage in Normandy,' by LAMBINET, is a small picture: an earnest study from the locality it professes to describe; the cottage, trees, and herbage we feel at once to be true, but the water and the sky are unlike nature. No. 200, 'Before the

Rain,' is a large landscape by the same painter; the subject is by no means an attractive one; but it, like the other, is a truthful description of a locality; this should have been the small picture, the other should have been the large one. No. 195, 'Erasmus composing his Eulogium of Folly at Sir Thomas More's,' by LABOUCHERE, shows but little play of chiaroscuro. We recognise at once Erasmus, and his friend. There are by the same painter two other works. No. 194, 'Luther burning the Pope's Bull at Wittenberg, Dec. 10th, 1520,' and 'Charles V., accompanied by his brother, Ferdinand, and the Duke of Alba, crossing the Elbe at the Battle of Muhlberg, 1547.' No. 301, 'Landscape near Nemours,' TOURNEMINE, is a small view, a section of a meadow so like nature that it may have been painted on the spot. By the same artist we observe No. 298, 'Coffee-House on the Banks of the Danube,' and No. 299, 'Bourg de Batz, on the Coast of Brittany.' No. 179, 'A Church Porch in Paris on Palm Sunday,' HILLERMACHER, contains a crowd of figures numerous and various, the poorer offering to sell palm-branches to the richer; the buyers are principally ladies, foreground figures, well-drawn and well-dressed; it is a work of much merit in the definition of character. No. 181, 'The Kitchen,' by HOGUER, is a most successful representation of a kitchen; there is much movement among the kitchen furniture and utensils, and the place is further enlivened by the presence of the cook; it is an excellent work. The same artist exhibits also, No. 182, 'The Boat Carpenter,' by HILLERMACHER there is a more interesting subject than the 'Palm Sunday,' that of 'Rubens Painting his Wife,' but although the composition has many good points, it is deficient of refined conception and clear execution. We know Peter Paul Rubens very well, everybody knows him, but we never should recognise him in the slovenly fellow presented to us here; there is no lack of portraits of Rubens. No. 322, 'Coffee-House in the Faubourg Bab-a-zou, at Algiers,' is a good, and, we doubt not, very accurate picture: No. 323, 'Fountain in the Faubourg Bab-a-zou, at Algiers,' is a worthy pendant by the same hand. No. 307, 'On the Banks of the Seine, Landscape and Cattle,' by TROYON, is a large picture, the best landscape in the collection, deriving life from a herd of cows driven apparently down to the river to drink; the animals are judiciously varied in pose and colour, and the light is broken on them with masterly skill,—a result of long and profitable experience. The foreground is amply detailed as to grass and weeds, but all sharpness of touch is most studiously avoided, and throughout the whole there is as little as possible of linear demarkation. The animals are sketchy, and not quite perfectly drawn, but upon the whole it is a production of rare excellence. No. 202, 'Cattle Watering,' LAMBINET, is a small landscape closely studied from nature. No. 39, 'The Hunt,' scene in the Forest of Fontainebleau, by AUGUSTE BONHEUR, is a work of much merit, but there are degrees of excellence in the parts; the rough foreground, with its whins, wild shrubs, and grass, is the forcible part of the picture; the trees are mannered, and not painted with that touch which defines masses of foliage, yet generally the work is of much interest. The same painter exhibits another excellent work. No. 142, 'The Toilet,' FICHET, is a graceful figure composition; other works are exhibited by the same painter; as No. 143, 'The Card Party,' No. 146, 'The Proposal,' &c. No. 105, by DAUZATS, is 'The Interior of the Church of St. Cecile, at Alby,' full of architectural detail. No. 167, 'The Invitation to Dinner,' by GUILLEMIN, is 'The Interior of the Residence of a French Ecclesiastic,' who receives a friend, and, with a great display of good things, invites him to dine. Other remarkable works are 'The Cold Morning,' by FRERE; 'The Last Supper,' by LEPELLE; and, by the same, 'The Adoration,' 'The Goatherd,' PALIZZI; 'The Lecture,' MADAME BRUNE; 'The Wood,' DIAZ; 'Explaining a Dream,' COMTE, &c.; many of which merit detailed description, but want of space compels us to give only the titles.

BRITISH SCULPTURE.

THE following communication has been addressed to Sir Benjamin Hall by the members of the Sculptors' Institute:—

SCULPTORS' INSTITUTE,
32, SACKVILLE STREET.

TO THE RIGHT HON. SIR BENJAMIN HALL, BART.

"WE, the undersigned British Sculptors, feel assured that we shall not be deemed intrusive or officious in addressing the following statements to a minister of the crown charged with the supervision of the public monuments of the country.

"We have observed with regret, that frequent attempts have been lately made by the most influential organ of the daily press to disparage the ability of British sculptors, and to defend as an inevitable necessity a recourse to foreign artists. It is moreover reported, that a large sum of money is about to be devoted to a monument to the Duke of Wellington, and another sum to a memorial at Scutari to the brave men who have fallen in the late war; and in the present temper of the public mind, and in the disposition of some who exercise the patronage of the country, we are not without apprehension that due justice will fail to be done to the English sculptors.

"We desire to guard ourselves against the imputation of an illiberal jealousy of the foreigner. Art is a universal language, and the artist should find himself a native of every great city of the world. There has never been a time, when the English courts and the English people have not received with ready welcome the foreign painter, architect, and sculptor;—may it be thus always. But we claim for native talent, that it also should be sought for and appreciated. It is not true that there is a dearth of genius amongst the sculptors of England. There are works of indisputable excellence from the hands of living artists, that attest the contrary. What is lamentably true is this—that means have rarely been adopted for committing public works to the men of greatest merit amongst us. We would humbly suggest, that, if the patronage of the nation were exercised with more care and discrimination, and with a genuine desire to discover the worthiest on whom to bestow it, the public monuments of England would no longer be appealed to as displaying in so many instances a painful mediocrity.

"None can feel more deeply than ourselves, the degradation which the sculpture of England has suffered during the last fifty years, from the erection in our Metropolitan Cathedral, the Abbey, and Guildhall, of the puerilities and distressing allegories which deface the walls of those buildings; but let it be borne in mind, that while large sums were being lavished upon such productions as these, Flaxman and Banks were alive, needy, and seeking employment; men who were neglected year after year by the government and the municipal authorities of that time, are now the boast of every Englishman, and are acknowledged to have earned an European reputation.

"To approach somewhat nearer to our own times, we would point to a fact of no little significance. A sculptor of the name of Watson recently died; he was an industrious artist, and a competitor for most of the public monuments erected in his day: he never obtained a commission, but the rejected models which he exhibited on such occasions are now sought for with avidity, and studied by living artists.

"Whether the same unfortunate method of selection still attends upon us, we must leave others to decide. We must observe, however, that there is an increasing indisposition amongst artists of acknowledged merit to enter into any public competition. It is felt, that a proposal for a general competition is no security against an incompetent or partial judge.

"To combat this indisposition, to foster the genius of the country, to secure for our greatest monuments the artists of the greatest power, we would finally submit,—1st, That in every competition a public exhibition of the models of all competitors should precede the selection of any one of them; and 2nd, That such selection should be made by a committee so constituted, that the body of artists, as well as the public in general, may confide in them.

"To a public competition so conducted we cheerfully invite every artist resident in the United Kingdom, and we rest confident that, patronage very liberally and wisely exercised, there will no longer be an impression abroad in this country, that the English sculptor is unequal to the celebration of English heroism.

"We have the honour, with great respect, to subscribe ourselves,

[To this memorial Sir Benjamin Hall has returned for answer, that the money for the Wellington monument has not been voted; therefore, no arrangements can be made. Sir Benjamin Hall refrains from saying one word relating to the Scutari monument; he ignores that altogether in his answer; but if "*the money not being voted prevents arrangement*" being made with regard to the Wellington monument, it applies with equal force to the one for Scutari; and we sincerely hope, for the credit of all, that such may be, and is, the fact, whatever our fears may be.—Ed. A.-J.]

THE PEACE TROPHY AT THE CRYSTAL PALACE.

It is understood that "the Peace Trophy" was a commission to the Baron Marochetti, from the Directors of the Crystal Palace; if so, the Directors have made a mistake; for beyond question it will do them much more harm than good—although it is probable that the actual cost was paid for by the receipts incident to its "inauguration" in the presence of Her Most Gracious Majesty, H.R.H. Prince Albert, the Court, and "the wounded of the Crimea." But loss of character is always ultimately pecuniary loss: and the trophy is a blot, from the reproach of which the Directors will not easily relieve themselves.

We can readily imagine the astonishment, amounting to indignation, of Her Majesty and the Prince, when the canvas covering was withdrawn from this "golden image" which Marochetti had "set up." Their good taste, and knowledge of art, its capabilities and its requirements, are sufficiently well known to induce universal belief that they found themselves grievously out of place in the Crystal Palace, to render honour, amounting almost to homage, to a work which, for any merit of design or execution, would have been rejected by Guter as the ornament of a trophy plum-cake. It has been so extensively described by the daily and weekly newspapers, that it is quite needless to enter into any description of it here; we observe, however, with no ordinary satisfaction, that we have not seen a single notice that gives to it a less condemnatory adjective than that of "execrable." It is, indeed, impossible to find in it a single particle of merit; a production claiming to be "art," so utterly worthless, was never placed before the British public.

We had some thoughts of selecting, from about twenty newspapers, passages of criticism on this work; and may yet do so—unless it be consigned speedily to the oblivion it deserves.

The monument for Scutari is of a better order, although that also is a poor affair. Who will for a moment believe there are not a score of sculptors in England who could have done more justice to so nobly suggestive a theme?

We earnestly hope our patrons of Art will learn a lesson from these failures. No one denies that Baron Marochetti can produce an equestrian statue; perhaps in a work of that class he surpasses the majority of his compeers: but we have never yet seen a production of any other order by him that at all approaches the productions of several of our leading British sculptors. Let any one who doubts this examine his "Peel" at the Crystal Palace, and the miserable bas-relief at St. Paul's. If this assertion be fact, how deplorable it is that so large a share of public patronage has been accorded to this gentleman, while, of all the arts, sculpture is the most difficult of sustenance in England!

CORRESPONDENCE.

To the Editor of "THE ART-JOURNAL."

THE MONUMENT FOR SCUTARI.

DEAR SIR,—You have so often defended right against wrong, and written so earnestly for the advancement of sculpture in this country, that I am induced to forward to you a few words respecting the exhibition, at the Crystal Palace, of Baron Marochetti's model for the monument to be erected at Scutari.

For full twelve months the *Times* has been feeling the "public pulse" with regard to this same monument and its author, and following, as you know I do, the profession of a sculptor, I am necessarily deeply interested in all matters relating to the Art I practise. It is, therefore, with great pain I have observed the ceaseless efforts of the *Times* to disparage British Art. In sculpture it seems to see nothing,—to know nothing,—to care for nothing,—to notice nothing—except the productions of Baron Marochetti.

Well, sir, at length we see the Baron's monument for Scutari at the Crystal Palace ("the grand and bold monotony," as the newspaper phrases it), and also "the Baron's celebrated peace trophy," at which some laugh and others grieve; but there they are,—and, though it would be unbecoming of me to express an opinion of the merits or demerits of the Scutari model, yet its exhibition decides one very grave and important fact, namely, the question of the sum that it should cost: Parliament, from all accounts, is to be asked for 17,500*l.* for a monument for Scutari. Is it to be the one at the Crystal Palace? If so—and I write with facts before me—all the sculptors I have communicated with (and they are many) would be well content with 6,000*l.* for such a production. I may tell you an estimate has been made, and it could be completed for a sum under 5,000*l.*: then *why* should there be a grant of more than 17,000*l.* when 6,000*l.* would be ample payment? Again, the character of the design is of that description which, of all others, demands the least amount of artistic work; it is required only to roughly model one figure, and multiply it by three casts from the same, and sure I am there are plenty of sculptors in this realm who would be glad to model such a statue for 150*l.*

I have the honour to be,

Yours truly,

A.

MINOR TOPICS OF THE MONTH.

THE NATIONAL GALLERY.—Four pictures from the "Rogers' Collection" have been secured for the National Gallery:—the copy, by Rubens, of Mantegna's "Triumphal Procession of Julius Cæsar," for 1,102*l.* 10*s.*; Rubens's sketch for his picture of "War," in the Pitti Palace, 210*l.*; Giotto's fresco from the Calmine church at Florence, 210*l.*; and Bassano's "Good Samaritan," 241*l.* 10*s.* These are all valuable additions to our picture museum.—Another addition has been made to the national collection during the past month, a picture painted in distemper by Alessandro Botticelli, a Florentine artist of the fifteenth century. The work is one of those purchased in Italy by the director during the past year; it is circular in form, and represents the Virgin with the infant Saviour, and two youthful figures in the act of worshipping him: one of these two is an angel, and the other appears to be St. John the Baptist: the expression of the Virgin's face is very beautiful, but there seems a remarkable family likeness in the three large figures, as if all had been studied from the same model. As an example of this old Florentine master this picture is not without value: it is in good condition, and the colouring brilliant for its age; yet there is little in it that the student will find profitable; the drawing of the limbs is altogether bad. The National Gallery contains no other work by this hand.

PROVINCIAL SCHOOLS OF ART.—It is understood that once in each year an inspector from the head department in London shall visit each provincial school of art, and shall hold an examination in certain of the early stages of the course; and at the same time in conjunction with the head master of the school, and assisted, if necessary, by a head master from one of the

nearest schools of art, adjudge local medals and rewards. The principal and advanced works rewarded with a medal will be sent to form a general or national collective exhibition, either in some one of the great provincial towns or the metropolis.

PANORAMA OF ST. PETERSBURGH.—Often as we have had occasion to speak in favourable terms of the panoramic pictures painted by Mr. Burford, we do not remember to have seen a more successful effort of his skill than the view of St. Petersburg, recently opened in Leicester Square; it is the perfection of scenic painting,—indeed, may almost take rank as a picture with the best class of landscape-painting. The view is taken from the summit of the observatory, near the imperial palace, which commands the whole extent of the city and the surrounding country, seawards as far as Cronstadt. Every part of the picture is painted in a most masterly manner; nothing appears slighted or left for the imagination to fill up, even to the minutest details of the architecture, and the colouring is everywhere as truthful as Art can render it. The painting of the water demands especial notice for its reality: there is a small steam-ship at anchor in front of the dockyard, which is brought forward with such extraordinary power that one can scarcely believe it to be represented on the same surface as the objects in its rear. The ripple on the surface of the river as it flows past the vessel is positively in motion.

THE STATUE OF SIR ROBERT PEEL in Cheap-side is now provided with its lamps, &c., completing the entire design. The tempting chance for the lovers of "uniformity" of placing four lamps at each corner, has been modified by better taste, and the general effect improved, by placing two only behind, and two posts in front. So far the change is agreeable, but the pedestal and its accessories are still little removed from the common-place, and are eclipsed by the city-statue of William the Fourth, opposite London Bridge.

MR. T. SEDDON has arranged, for private exhibition, an interesting series of sketches, by himself, in Jerusalem and Egypt. They are pictures of remarkable places, most truthfully rendered, and an additional interest is given to them by the fact of their being all painted on the spot, and not at home from slight sketches, as is frequently the case. Hence, there is much truth and vigour about them. The large pictures of the Valley of Jehoshaphat and the Pyramids are excellently rendered; the undying interest of most of the scenes depicted, need, however, not be insisted on. They may be seen at 52, Conduit Street, throughout June.

THE BUILDING erecting near Brompton Church, for the use of the Commissioners of the Great Exhibition of 1851, and intended for a Museum, is rapidly completing its features of ugliness. As a mere frame-work of iron and glass, its in-artistic appearance has been denounced, but it is now closed in with sheet metal, and looks like an immense steam-boiler. It is perfectly marvellous how anything so hideous could emanate from such a quarter; the gas-meters of Lambeth are elegancies by comparison.

THE WOOD CARVINGS OF MR. W. G. ROGERS, and especially some of his restorations of the works of Gibbons, are now deposited at the establishment of Messrs. Boose and Roe (successors to Forrest), at No. 54, Strand. A visit to this collection may afford pleasure to all who appreciate excellence in Art, and who can rightly estimate the high abilities of the accomplished artist. Mr. Rogers deservedly stands at the head of his profession; he has been surpassed only by his great predecessor, whose works after the lapse of more than a century it is his pleasant task to rescue from the grasp of the destroyer.

INDUSTRIAL EXHIBITION AT MANCHESTER.—The year 1857 is, it appears, to have its commemoration by another Exhibition of Industrial Art, to be held in Manchester, where a structure is to be erected for the purpose. It will be, of course, our duty to render it all the assistance in our power. If an exhibition could be successful anywhere out of London, it must surely be in this—the great city of Art Manufacture, not only of cotton but of a hundred other articles

which create the wealth of the empire. The projectors do not, probably, calculate upon its "paying" in the ordinary sense of the term, but there are many ways in which it will be remunerative. A very large sum has been already subscribed, so as to render failure an impossibility. We shall, no doubt, have more to say on this subject ere long; meanwhile, we have only to observe that the result will entirely depend on "the management,"—if that be good, there can be no danger; if it be incompetent, disappointment is certain.

DRAWINGS OF THE CRIMEA.—Messrs Dickenson of Bond Street have added very largely to their collection of drawings of the seat of war, comprehending views, battles, marches, buildings, fortifications; in short, all matters which serve to throw light on this ever-interesting subject. The exhibition is free.

A SOCIETY—to which has been given the name of **THE NATIONAL GALLERY REFORM ASSOCIATION**—has, it appears, been formed; of how many "Members" it consists we are not told, but we may easily guess; it would be, we imagine, no difficult matter to name the half-dozen; meanwhile, all we positively know is that "William Coningham" is the Treasurer, and that he addresses from "the Oxford and Cambridge Club."

THE CRYSTAL PALACE.—Some immediate reference to the various improvements that are in progress here seem to be required; although it is our intention next month to notice them at length and in detail. An active and intelligent manager, Mr. Fergusson, has been for some time at work, not only to renovate but to remove; he has had not alone to avoid the evils into which his predecessors had fallen, but to go back many steps in order to give to the scheme the character to establish which it was originally devised. It is notorious that as a nursery of industrial Art—such as it was expected to be—it is entirely a failure; but a remedy is by no means impossible, and arrangements are now making which may yet render the Palace a very valuable auxiliary to the manufacturer. It is to this special branch of the subject we shall direct attention in our next, and in succeeding parts, for our purpose is to illustrate some of the Courts in which the productions of Art-industry are deposited.

HOSPITAL FOR CONSUMPTION.—The bazaar to which we referred two or three months since, in aid of the funds of this valuable institution, will take place on the third and two following days of this month, in the grounds of the Toxophylite Society in the Regent's Park, wind and weather permitting—for while we write the elements are terribly adverse to fêtes of this description—there is little doubt of the Hospital receiving substantial benefit from the proposed bazaar, as it always has done on previous similar occasions.

MEMORIAL OF THE GREAT EXHIBITION.—Something, it appears, is to be done in reference to the subscription that was entered into in 1852, to preserve "a memorial of the Great Exhibition, in connection with a testimonial of admiration and esteem to H.R.H. Prince Albert;" Alderman Challis (who, as Lord Mayor in 1852, set the subscription on foot) has summoned a meeting of the subscribers; but it was held at too late a period of the month to enable us to comment on the proceedings.

HER MAJESTY'S THEATRE.—The great pleasure of the season is the re-opening of the noble temple of the Musical Drama, "HER MAJESTY'S THEATRE," where for so many years Mr. Lumley delighted the public, while improving their taste, in a manner that should never be forgotten. It was quite refreshing to find ourselves once more in the "Old House at Home,"—to see it as unfaded and fresh as when the "Swedish Nightingale" poured forth her wealth of song within its walls, and the dome echoed back the thunders of Lohache.

DR. WAAGEN, we hear, is about to visit this country again, during the summer, to complete his work on "The Art-Treasures of England."

CARL WERNER'S DRAWINGS.—We noticed last year the collection of water-colour drawings exhibited by this artist at 49, Pall Mall, and we have much pleasure in inviting attention to a new collection, the result of more recent labours.

They are not numerous—the subjects are principally Venetian interiors, saloons, and halls of state, well-known to many past generations, and now sought by the artist and traveller attracted by their history and tradition. There is among these works one large composition, full of figures, of which the subject is "The Departure of Caberia Cornaro, Queen of Cyprus, from Venice." "The Great Hall in the Doge's Palace" at once recalls the reality to the memory of all who have seen the room; its famous pictures are all recognisable. Other remarkable subjects are "The Library in the Doge's Palace," "The Doorway of the Convent of St. Gregorio," "Interior of St. Mark's," "Entrance of the Church of St. Zeno, from the Cloister, Verona," "Tomb of Romeo and Julietta, Verona," "Interior of St. Antonio, Padua," with many other subjects of much interest. Carl Werner is undoubtedly an artist of the very highest talent; and as a master there are few in England under whom pupils may so advantageously study.

COPYRIGHTS IN ART.—The following notice of motion was made in the House of Commons, on the 19th of May, by Thomas Chambers, Esq., the member for Hertford: to move for a

"Select Committee to inquire into the present state of the Law of Artistic Copyright; the operation of the Engraving and Sculpture Copyright, and International Copyright Acts; together with the Conventions entered into by Her Majesty with various Foreign States, and the Orders in Council founded thereon, so far as the same relate to Artistic Copyright, with a view to the amendment and consolidation of the Engraving and Sculpture Copyright Acts."

It is high time this subject should be considered by the Legislature; and we shall look for the discussion with no ordinary anxiety.

FLAXMAN'S BASSI-RILIEVI at Covent Garden Theatre have remained uninjured by the late fire, and will, of course, be carefully preserved. They typify, in two compartments, the ancient and modern drama. In one we see Aristophanes and Menander with the Greek Chorus; and Æschylus contemplating the pursuit of Orestes by the Furies. In the other, Shakspeare is calling up his principal creations in Tragedy and Comedy; while Milton is thoughtfully gazing on a scene from his own "Comus." The very graceful statue of "Comedy," bearing the characteristic mask and crook, emblematic of her pastoral origin, is also by Flaxman, and bears his name on the pedestal.

PRIVATE MUSEUMS.—Two private museums have become public property in the course of the last month; the one by gift, the other by purchase. The gift is to the city of Liverpool, and consists of the large collection formed by Joseph Mayer, F.S.A., and which has long been exhibited in Colquitt Street, in that city. It embraces objects of all ages and countries, and is particularly rich in Egyptian specimens; there is, however, scarcely any department of antiquities unrepresented, and the recent additions of the celebrated Faussett collection of Anglo-Saxon antiquities, and the Fejeráry collection of Roman ivories, have given it a great renown. Mr. Mayer has spent more than 30,000*l.* in its acquisition, and has munificently presented it to the Liverpool people for their new Museum and Hall of Science, about to be erected near the Town Hall. The Museum, which has become public property by purchase, is that formed by C. Roach Smith, F.S.A., and which will now be located in the British Museum. It is especially curious as illustrative of Roman and mediæval London; indeed, it almost entirely consists of relics obtained within the boundaries of our metropolitan city, during the excavations made within the last thirty years.

THE ALLIED GENERALS AT SEBASTOPOL.—A painting of very great merit, and of the highest possible interest, at this moment, has been painted by Mr. T. Jones Barker, and will be exhibited, during the month of June, at Messrs. Colnaghi's, Pall Mall. We cannot, at present, do more than refer to it as containing the portraits of seventy or eighty generals, &c., who had "leading parts" in the war, and who are assembled before the ever-famous fortress.

REVIEWS.

THE SCENERY OF GREECE AND ITS ISLANDS. Illustrated by Fifty Views, sketched from Nature, etched on Steel, and described *en route*, with a Map of the Country. By WILLIAM LINTON. Published by the Artist, London.

The sight of any place which has been the theatre of remarkable historical events naturally brings before the imagination whatever has occurred there: it is not necessarily the scene itself, how beautiful soever it may appear to the eye, that renders it attractive, so much as the associations which are connected with it. We rebuild, in our mind, the ruined towers of some ancient fortress, and we seem to see the armed hosts encamped against it; we gaze on some old battle-field, now, perhaps, covered with golden corn ripe for the sickle of the husbandman, and once more it is glittering with helmet and cuirass; we walk amid the silence of cloister and colonnade now mouldering into dust, and remember that the smoke of holy incense once ascended up from its altars, and hooded monks sang in chorus to the loud-pealing organ; we visit the lonely chamber from which the martyr or the patriot was led forth to the scaffold, and the ear still catches the "groaning of the prisoner appointed to die." At times like these we hold communion with the past; thought is too busy with the dead to have much intercourse with the living.

Such feelings as those we have attempted to describe took strong possession of us while slowly turning over the pages of Mr. Linton's delightful volume: we say "slowly," for each picture summons up a train of shadowy thoughts concerning a people whose history seems, at this distance of time, and with the change that has passed over the spirit of our world's mind, to belong rather to fiction than reality. The first plate, for instance, introduces us to the wide level plain of Megalopolis, and the mind instantly reverted to its founder, Epaminondas, the victor at Leuctra, where four thousand Spartans, with their king, were left dead on the field. Next we have Athens in three or four plates, in one of which the ruined columns of the Temple of Jupiter Olympius stand out in bold relief against a background of dark thunder-clouds that appear more in harmony with the noble wrecks of Athenian grandeur, than if these were presented amid the blaze of sunshine. As the traveller leaves Athens for the tour of Northern Greece, he passes through the wild and rocky gorge of Phyle (Plate 6), from which Thrasylus descended with seven hundred men against the Thirty Tyrants: the scene is most artistically represented by Mr. Linton's pencil. Boeotian Thebes comes next, conjuring up visions of Pindar, Epaminondas, and a host of other great names that added lustre to old Greece: the modern town, with its aqueduct, and the mountains of Eubœa in the distance, make a picturesque composition. Mount Parnassus, sacred to meditation; the cliffs of Trophonius, amid which were the Hieron, or sacred grove, and Temple of Hereyna; the Acropolis and Plain of Cbarœnea, where the Athenians were defeated by the Boeotians in the fifth century before Christ; and, with their allies, the Spartans, were also vanquished by Philip of Macedon about a century after, and where the Greek historian, Plutarch, was born; Delphi, "whose oracles are dumb;" the Fount of Castalia, the waters of which inspired all who drank of them with the genius of poetry, severally appear in successive plates.

Salona, to which Diocletian retired after he had abdicated the Roman diadem, forms a beautiful picture, surrounded as the town is by objects of deep interest to the classical student; "a more spirit-stirring scene," as Mr. Linton observes, "is scarcely to be found in all Greece." Eleusis, where was held that mysterious festival, to which many of the Grecian tribes went up, as did the Jews to the feast at Jerusalem, to take part in the most solemn religious ceremony observed by the ancient Greeks, is now a mean village, whose scattered houses, however, form the foreground of an interesting picture. The Acropolis, and Mars' Hill (Plate 17), bring to mind St. Paul denouncing the superstition of the Athenians, no less than all the other events connected with the history of the people, whose great council was held here. "The hill of Areopagus offers," says the writer, "one of the best positions at Athens for contemplating 'the flood of fire' with which the marble columns, the mountains, and the sea, are all bathed and penetrated by the illumination of an Athenian sunset."

We have no space to follow Mr. Linton in his tour through the Morea and the islands of Greece, which form the subjects of his remaining plates; there is not one that does not invite our remarks, but we are constrained to forbear. A more captivating book has rarely passed into our hands;

and it is one which must have cost the author some years of arduous labour. We have long thought Mr. Linton an artist whose genius has not been sufficiently appreciated by the public; his pictures of Greek scenery, and his compositions from classic history, such as "The Embarkation of the Greeks from Troy," and "Caius Marius among the Ruins of Carthage," have never been excelled by any works of similar character; they are full of the most expressive poetry of classic Art. He comes before us in this volume as an engraver, for the plates are all from his own etching-needle, aided, we presume, by the ruling-machine; the majority of them have the finish, delicacy, and force of the most elaborated line engravings, so much as to render it difficult to say they are not. He is, moreover, a scholar, of which there is ample proof in the text that accompanies his views, and to the scholar who loves to "tread on haunted ground," this work will be as welcome as it cannot fail to be to the admirer of Art.

NOTES ON SOME OF THE PRINCIPAL PICTURES EXHIBITED IN THE ROOMS OF THE ROYAL ACADEMY AND SOCIETY OF PAINTERS IN WATER-COLOURS. By JOHN RUSKIN, M.A. Published by SMITH & ELDER, London.

We are agreeably disappointed by this notice of the pictures in the Academy. Mr. Ruskin finds it inconvenient to be consistent in his animosities. In his preface to these "Notes" he deprecates what he calls anonymous criticism, and congratulates himself that he is ready to answer for everything that he has written. What is Mr. Ruskin's response worth? He has, among a certain class of persons uninitiated in art, wielded some influence through a speciousness of language and a professed enthusiasm for painting; and within this circle he has artfully endeavoured to damage the reputation of the best men of our school, until on all hands there is an unanimous effort to suppress, or at least neutralise, the nuisance. Can we not lay our finger, in Mr. Ruskin's works, on passages the most insolent that were ever aimed at the reputation of distinguished men? Will these men now thank him for his empiric patronage? He claims for himself the purest spirit of impartiality, but he praises inordinately Mr. Millais, and he surely tells us that Millais is his friend; he praises in like manner Mr. Hunt, and claims him also as his friend; he praises also Lewis, and there generally most deservedly, though frequently in the wrong passages. If Mr. Lewis is not already his friend, does he wish to make him so also? How has he written of Maclise, Stanfield, Roberts—nay, of all whom he chooses to distinguish from the "new school?" What he wrote publicly of Roberts last year in his "Notes" is publicly known, but not what he communicated to him privately, which it is said amounted to a declared determination to write *down everything that he should in future paint*. Now for the recantation which comes in the "Notes" before us. Speaking of the St. Peter's picture, he says: "It is both careful and brilliant. . . . I can answer for the careful delineation of what must be to most people a striking scene. . . . Note, for instance, the pretty and true change in the colour of the red cross in the dome, where it is half in shade and half in sun." This of course rescues Mr. Roberts from the ban put upon him last year; he must be most grateful, and will again appear happy to his friends. Mr. Ruskin alludes to a change in Mr. Roberts's manner. There is no change; as he paints this year, so he painted last. Mr. Stanfield is also fortunate in eliciting eulogiums in these "Notes" on "The Abandoned." The sea is "quite Turnerian, in the mystery of the farther waves, and the sentiment of the picture very grand." But Ward's picture is "excepted from the progressive list"—at least Mr. Ruskin "fears" it must be so—and "marked as one of the representatives of the old school;" but the notice terminates with the redeeming clause, "it is not a bad one." This final patting on the back must have saved the artist much pain! Upwards of five pages are devoted to "The Scapegoat," but the pith of the notice is that the picture, "regarded as a landscape or as a composition, is a total failure;" that, in painting such a picture, Mr. Hunt had "forgotten to ask himself first whether he could paint a goat at all." The critic has committed himself to other works, but feels from former experience that it would not be safe to praise this work. In speaking of "Autumn Leaves" (J. E. Millais, A.), it is said to be "the most poetical work the painter has ever conceived, and also, as far as I know, the first instance existing of a perfectly painted twilight." On the whole, the tone of these "Notes" is apologetic; we must say, that they do not present so much of that sneering arrogance which has characterised Mr. Ruskin's former notices.

NAPOLEON REBUKING HIS OFFICERS ON THE BATTLE-FIELD OF BASSANO. Engraved by C. G. LEWIS, from the Picture by T. J. BARKER. Published by J. G. BROWNE, Leicester.

The print-publishers in the country seem of late to be keeping pace with those of the metropolis, in the number and importance of the works they bring out: Mr. Browne, of Leicester, is a name rather new to us, and if this print be his first speculation, as we believe it to be, it is a bold effort, but, we expect, it will prove far from an unsuccessful one. The war-fever is not quite over with us yet, and just now we seem to take especial interest in all that refers to the terrible adventures of national conflicts. The engraving before us recalls to our recollection many of the large battle-pieces from the pictures of Horace Vernet, of whom, by the way, Mr. Barker was a pupil, if we mistake not; and certainly his compositions show much of the spirit and daring energy which characterise those of the French military artist. The historians of the wars in which Napoleon was engaged tell us that when he was riding over the field of Bassano, in Italy, one of the places identified with his earliest military achievements, he came upon a dead trooper and his horse, at the side of the former was a large dog piteously howling over his prostrate master. Whether or not the French officers had been guilty of unnecessary cruelty, so as to justify the remark addressed to them by their general, we do not at present remember; but Napoleon is said to have directed their attention to the animal with the remark,—"There, gentlemen, that dog teaches us a lesson of humanity." The print is a very large one, the subject divided into three distinct groups: to the right are Napoleon and a portion of his staff, consisting of Generals Augereau, Berthier, Massena, and Marmont, each of whom acted a distinguished part in the subsequent wars of the Consulate and the Empire. The centre group is composed of the dead trooper and his companions; the left group, of some wounded republican soldiers, for one of whom a pretty *vivandière* is pouring out a cordial. The background shows the town and fortress of Bassano, and the plain in which they stand is filled with the victorious troops of France. The story is very graphically represented, and carries the sympathies of the spectator with it; the strife of the battle is over, the "hurly-burly is done," leaving, however, its sad and sickening results spread out before the eye; but there is a quietude and repose over the scene contrasting, not unpleasantly, with what has been, for it is in harmony with what now is. Napoleon and his officers have been copied from well-authenticated portraits, that of the general-in-chief from the celebrated bust by Canova, it of course, represents him as a young man, widely different from the portraits with which we are most familiar: this is a very spirited group, both it and the central figures are very effectively engraved; and, indeed, the general character of the execution is vigorous and brilliant. It is certainly one of the best of the "war-prints" which have been issued in this country.

THINGS NOT GENERALLY KNOWN. By JOHN TIMBS, F.S.A. Published by DAVID BOGUE.

Authors, it is well-known, frequently damage themselves when they write long prefaces, or (some say) prefaces of any kind—but that which Mr. Timbs has gracefully prefixed to this volume, is a golden key to his interesting and very useful book. "You may, perhaps say, 'Your volume contains but a small portion of things not generally known.' Granted, but here are no fewer than FIVE HUNDRED groups of instances, from the Heavens and the Earth; the sea and the air; light and sound; life and death; the animal and vegetable kingdoms; the origins of house and home; the festivals of our calendar; historical glances at laws and customs; dignitaries of church and state; national characteristics; wonders of our inventive age; and a few curiosities of art and literature of early times."

The volume is divided into subjects—"Marvels of the Heavens," of "The Sea," of "The Atmosphere," of "Life and Death," of "The Animal Kingdom;" "Domestic Marvers;" and so on:—and all are so well selected, as to be capable not only of conveying much information, but suggesting much more; it is impossible to place in the hands of the young, a work of higher interest, or greater value; it beguiles the reader into knowledge without force or effort; while those who have passed through many years of life, and think, as they may do without presumption, they are well-versed in literature, and have acquired much and varied learning, cannot fail to enjoy a compendium of what they devoted so much time to

acquire: indeed this volume is invaluable to young and old, and we congratulate the public on the result of Mr. Timbs' researches, which may be called "Universal."

THE FERNS OF GREAT BRITAIN. THE FERN ALLIES. A Supplement to the "FERNS OF GREAT BRITAIN." Illustrated by J. E. SOWERBY, Proprietor of "Sowerby's Botany." The Descriptions, Synonyms, &c., by CHARLES JOHNSON, Esq., Botanical Lecturer at Guy's Hospital. Published by the Proprietor, Mead Place, Lambeth.

The botanical works to which the name of Sowerby is attached have been so long before the public, and so appreciated by that portion of it who are interested in the vegetable kingdom, as to place him among the most popular of our writers on the subject. The importance which the Fern tribe has lately assumed in the conservatory, boudoir, and even in the drawing-room—and how varied and elegant is the foliage of these simple, wild children of the soil—demands such a book as Mr. Sowerby's publication to aid the amateur in its cultivation; for it contains all that is necessary for the amateur grower to know. It seems that the author has not been fairly treated, in reference to this work, by one of the societies that publish books on moral and religious subjects, at a comparatively low price, for the benefit of the large masses of the community; the society in question having, within a few months after the completion of his volume, issued one of a similar character, in which a large number of Mr. Sowerby's drawings were copied without his permission, or the least acknowledgment of the source whence they were taken. This is not honest, and we can scarcely believe that those who have the management of the publishing department of this institution were aware of the offence which had been committed. We do not at all consider that such a society is travelling out of its legitimate path in issuing works of this character; but it ought at least to take care that in so doing, the rights of private authors and publishers are not infringed upon.

THE FERN ALLIES, a term recently applied to certain small families of the Fern tribe, are spoken of in a supplementary volume, which must take its place beside the other on the table of the botanist.

ANALYSIS OF ORNAMENT.—THE CHARACTERISTIC OF STYLES: AN INTRODUCTION TO THE STUDY OF THE HISTORY OF ORNAMENTAL ART. By R. N. WORNUM. Published by CHAPMAN & HALL, London.

We hold it as an axiom that no one can thoroughly enjoy the beautiful in Art, to whatever class the object he contemplates belongs, who has not some knowledge of the principles, or rather of the character, of that which constitutes its beauty. There must be, so to speak, some analogy between the mind and the matter to constitute real pleasure—the faculty of seeing aright must be combined with that of understanding aright. Hence we would strenuously advocate the propriety of making at least the fundamental principles of Art of every kind a part of general education in every school, private or public, throughout the kingdom. Were this done, there would be a generation after us far wiser than their fathers, and better able to appreciate all that is good and to shun whatever is bad; and for such a purpose Mr. Wornum's "Analysis of Ornament" would be a very suitable book of study in that particular branch. Although only an abstract of a course of lectures originally prepared for, and delivered at, the government Schools of Design, there is in the book sufficient information afforded on the characteristic elements of the various styles to be exceedingly profitable. In all Mr. Wornum writes he is eminently lucid and practical, and these qualities, added to the numerous examples of ornament with which his work is illustrated, render it instructive and comprehensible to the mind even of a child.

TASSO AND LEONORA, THE COMMENTARIES OF SER PANTALEONE. By the Author of Mary Powell. Published by ARTHUR HALL & Co., London.

The Author of "Mary Powell" has acquired a well-earned celebrity by the ease and grace with which she recounts the real and fictitious events of past times. Her descriptions are strictly artistic, and her purity of sentiment, and perfect taste, render her writings most fascinating. If not her best, TASSO AND LEONORA is certainly among her best books, and she has not, as yet, written one too many.

THE ART-JOURNAL.

LONDON, JULY 1, 1856.

THE PORCELAIN MANUFACTORY OF CHINA.

HE making of Pottery has ever been one of the first Industrial Arts practised by mankind. Before they have learned the use of metals, or the mode of working them, the rude inhabitant of uncivilised countries shapes with his hands the vessel of unburnt clay which serves either to hold water, or to receive the ashes of the dead. Accident, probably, led to the discovery that this primitive ware might be improved by baking. Another step in progress produced the potter's wheel, which gave symmetry to the irregular forms fashioned by the hands. The Pannathænaic vases of Greece; the terra-cotta statues of Etruria; the Samian ware of ancient Rome; the elegantly turned pottery of Magna Græcia; the lustrous ware of Moorish Spain; the iridescent majolica of the Mediterranean shores; the rustic pieces of Bernard Palissy; the terra-cotta groups of Luca della Robbia; the Raphael ware of Pesaro; and the perfect porcelain of China and Japan, had no other beginning than the bowl of clay shaped by the untutored hand of the savage.

All these different productions of the Ceramic Art have, in their turn, been the admiration of our race; but Athens, Etruria, Rome, Magna Græcia, and Moorish Spain, have ceased to exist as nations; the processes of the Palissy and of the Della Robbia family have been lost; and the few relics of their Ceramic Art which have been preserved to the present time are amongst the most valued Art-treasures of archaeologists. China alone, which began ere they began; which was a great nation when they were each and all most powerful; is still a great nation when they each and all have passed away, and are no longer reckoned amongst the nations.

The first making of pottery in China is lost in the obscurity which hangs over the mythological Emperor Hoang-ti, the Potter; the invention of terra-cotta in China belongs to the Emperor Chun, also a potter, whose reign verges on the confines of mythology and true history. When the Roman Empire was in its zenith, and the Christian era had not yet begun, China alone had achieved a triumph in the Ceramic Art by the invention of the true hard porcelain. While the great empires of the West were trodden under foot by the northern barbarians, China, safe in her isolated position from all but Tartars, went on from century to century perfecting her Art, guiding, as it were, by the unity of one mind, the untiring industry of her vast population. All the emperors—as well those of the Tartar as of the Chinese dynasties—fostered and encouraged the porcelain manufacture as the brightest jewel of their crown. While Europe was passing through the troublous times known in history as “the dark ages,” the Chinese porcelain manufactory was in full activity, producing in succession “white jars brilliant as jade,” vases “blue as the sky after rain,” or “of the colour of rice,” or “red as the sun after rain.” Then flourished the Chinese artists Tehang and Chu, and others famous in the history of Chinese porcelain, whose untranslatable names convey no meaning

to an English ear. And the Art-manufacture continued to prosper while distant Europe scarcely knew of its existence, save from the incidental account of some early traveller. Although some specimens had been brought to the Moorish states of Northern Africa during the middle ages, none were seen in Europe until the return of the Portuguese from their long voyage round the Cape of Good Hope, introduced this beautiful product of the Ceramic Art to the West. Europe saw and admired; many nations tried to imitate that which for nearly two hundred years proved inimitable. The soft porcelain of France, which was first made in 1695, and the soft porcelain of Bow and of Chelsea, of Derby and Worcester, though beautiful in their kind, were greatly inferior to the hard porcelain of China. It was not until 1706, that is to say, one thousand seven hundred years and more after its invention in China, that Böttcher, then in the employment of Frederick Augustus, Elector of Saxony and King of Poland, succeeded, after many trials, in making hard porcelain. He kept his secret so well that hard porcelain was not made in France until 1768 or 1770. England, however, did not acquire the Art until a much later period.

The Chinese porcelain manufactory has now existed for upwards of eighteen hundred years, and still shows no signs of decay—a circumstance unprecedented in the history of nations.

Shortly before the commencement of our era, some Chinese emigrants carried the Art to Japan; there it prospered among that exclusive people, and there it still prospers. Some connoisseurs prefer the porcelain of Japan to that of China.

From the beginning of the 16th century almost to the Chinese war in our own times, China was looked upon by Europeans as a land of wonders and mystery, from which foreigners were excluded with jealous pertinacity: a land rich in tea and silkworms; whose industrious population produced porcelain and lacquer-work by unknown processes, and with unknown materials; whose sovereign was the “brother of the sun and moon,” and “son of heaven,” whose men wore tails of hair on their heads; who suffered their nails to grow like claws; who used cats for timepieces; who tied stones to their donkey's tails to prevent their braying; and who eat birds'-nests, rats, and puppies; and whose women had small feet, which were, it was said, cramped and crippled in infancy in order that they might not roam far from home.

The issue of the war, which was successful as far as we are concerned in opening the ports of China, increased our knowledge of the country; our intercourse with the Chinese has now more of reality, less of the marvellous.

The Chinese are a decidedly literary people. Education is so generally diffused that almost every man can read and write. They had stereotyped books in the 8th century of our era, and movable types of baked clay a hundred years before Gutenberg's discovery. Their published works have found a place in the public libraries of Europe, and European professors have begun to study the language. A new field of literature is thus opened to us, and translations from the Chinese are among the most recent literary productions. The most valuable of these to our country is decidedly one on the History and Manufacture of Chinese Porcelain—a French translation of which we feel much pleasure in introducing to our readers. We are indebted for this translation to M. Stanislas Julien, Conservateur-adjoint of the Imperial Library at Paris, a member of the Institut Français, and Professor of the Chinese and Manchou-Tartar languages. M. Julien is already known in this country by his work, entitled, “*Resumé des Principaux Traités Chinois sur l'Éducation des Vers à Soie et la Culture des Mûriers*,” which has been translated into Italian, German, English, Russian, and modern Greek, and which Mehemet Ali ordered to be translated into Arabic for the use of the Syrians. A translation from the Chinese, by an author whose previous work had been so well received, would have deserved our attention, even if the subject had been much less interesting than we find it.

Independently of the passion for old china, which, although not so general as it was some years ago, is still prevalent in this country; the fact that the manufacture of porcelain constitutes one of our Art-industries—and a very successful one too—invests the work with a social value which otherwise

it might not possess. It is no slight recommendation of M. Julien's translation* to say that his rendering of the passages descriptive of the technical processes of the porcelain manufactory in China has obtained the approbation of M. Salvétat, Professor of Chemistry at the Manufactory of Sèvres.† But the interest taken by M. Salvétat in the book is not limited to a simple expression of approbation; he has imparted to it additional value by an introductory preface relating to the manufacture of porcelain, and by the useful practical notes on almost every part of the process by which he has illustrated the technical part of the Chinese work. In order to render the account of the porcelain manufacture as complete as possible, Dr. Hoffmann, of Leyden, has added a memoir, translated from the Japanese language, on the porcelain of Japan.

The first of these oriental works thus happily introduced to European readers by this learned trio is divided into seven books, some of which are historical and descriptive, the remainder technical. The whole are copiously illustrated with woodcuts of the various marks and characters by which the different kinds of porcelain are distinguished, and the fifth part by a series of plates to which we shall again allude.

Beginning with the historical part, and assisted by M. Julien's excellent preface, we shall endeavour to give a brief abstract of the rise and progress of the porcelain manufactory in China. The Chinese, as M. Julien observes, are the only people who possess an exact chronology which extends from the most remote antiquity to the present time. Whether their early history is more trustworthy than that of other nations is perhaps doubtful. Their official annals ascribe the invention of pottery to one of their emperors, Hoang-ti, who, they say, ascended the throne in the year B.C. 2698. In early times, nations selected their monarchs for their personal prowess or qualifications; it was reserved for the Chinese to elect for their sovereigns men skilled in the art of the potter. The Emperor Chun, also, before he was raised to the throne, B.C. 2255, made pottery in the province of Chang-tong. All the Chinese authors are agreed that the manufacture of terra-cotta vases began in this reign, and no other kind of ware was made until the Tsin and Han dynasties, B.C. 249—202.

The invention of porcelain proper, which took place in the district of Sin-p'ing, ranges, according to M. Julien, between the years 185 B.C. and 88 A.D.—no less than one thousand six hundred years before the discovery of the process in France; but if the Japanese account of the porcelain manufactory in that country, in the year B.C. 27, be correct, the invention must be placed between 185 and 27 B.C.

For a long time the process of the manufacture in China was slow and uncertain. During the Wei dynasty (220—264 A.D.) the manufacture extended itself in various localities. The only peculiarity recorded of the porcelain made under the dynasty Tsin (265—419 A.D.) is that it was of a blue colour, and much valued. In the year 583, the manufacturers inhabiting the district of King-te-tehiu were ordered to make porcelain for the use of the emperor, and to send it to his capital Kien-Kang (now Kiang-ning-fou), the capital of the province of Kiang-nan.

As early as the time of the Soui dynasty (581—618), we find that some of the ancient processes had been lost, and that the green porcelain made by Ho-tcheou to replace it was much praised. In 621, the manufacture of porcelain was generally diffused over the country, and the names of many artists have been preserved as the inventors or improvers of peculiar descriptions of porcelain. About this time were produced the vases which acquired the name of *artificial jade*, and the porcelain of Ho, on a white ground, “brilliant as jade.”

In 954 was made the porcelain of Teh-ai, which was “blue like the sky after rain,” whence its name. It was, says a Chinese writer, “blue as the sky, brilliant as a mirror, thin as paper, sonorous as a k'ing (a musical instrument), polished and lustrous, and as remarkable for the fineness of its veins, or

* “*Histoire et Fabrication de la Porcelaine Chinoise*, ouvrage traduit du Chinois par M. Stanislas Julien, accompagné de notes et d'additions par M. Alphonse Salvétat, et augmenté d'un Mémoire sur la Porcelaine du Japon, traduit du Japonais par M. le Docteur Hoffmann.” Paris, Mallet-Bachelier, Quai des Augustins, 55. 1855.
† See M. Salvétat's Preface, p. lxxviii.

crackles, as for the beauty of the colour." The secret of making this much admired ware was lost after a few centuries; when, such was the estimation in which it was held, that those who were fortunate enough to possess fragments of it wore them in their caps of ceremony, or fastening them to pieces of silk, used them as necklaces. We can only notice briefly the beautiful crackle porcelain ware of "the elder brother" of the Tehang family; the delicate pale blue ware of "the younger brother," A.D. 960; the works of the venerable Chu, who excelled in modelling in porcelain different kinds of animals, birds, and similar objects. The daughter of this artist, called "the fair Chu," was even more skilful than himself in this line of Art, and her vases for flowers were each worth several ounces of silver. The famous "porcelain of the palace" (A.D. 1127) was so called from the manufactory having been established in the house of the director of the palace of the capital of the dynasty of Song, after their removal into the south.

Passing over the Mongol princes of the dynasty of Youen (1260—1349), we come to the great dynasty of Ming (1368—1649), under whom the porcelain manufactories became much more numerous, although their productions still preserved the delicacy and beauty for which they were remarkable. Even now the Chinese antiquaries set a great value upon some of the porcelain of the Siouen-te and Tehing-hoa periods of this dynasty. Among the most valued may be mentioned the cups of Lo, ornamented with crickets fighting; especially those made by two young girls, sisters, called Ta-sieou, the ornaments of which—also crickets fighting—were engraved in the paste with a pointed tool. Between 1463 and 1487 flourished an artist in porcelain named Kao-than-jin, who ornamented the top of his jars with the flower of a *Pæonia montan*, and the foot with a hen and chickens full of life and movement.

The commencement of the 15th century was an era in the history of the manufacture of porcelain in China; for the pigment known as cobalt blue, which had been manufactured in Germany in the latter part of the preceding century, was then introduced into China. The Chinese called it *Hoei-tsing*, and were so pleased with the new colour that for an equal weight they willingly paid double the price of gold. "When," says our author, "it was generally known that it would bear the fire without changing, the emperor ordered it to be used on porcelain, to which it gave an antique grace. For this reason the porcelain of this period (1506—1521) with blue flowers is exquisitely beautiful." Previous to this time the Chinese had used for their blues the impure ores of cobalt found in China.

Between the years 1522 and 1572, we read of the coarse and common jars, basins, bowls, and other ware made at Hong-pong, of the skilful imitations, by the venerable Tsoui, of the beautiful porcelain before-mentioned of Lo and the sisters Ta-sieou. From these meagre annals we gladly turn to an interesting account of an artist who flourished in the next period, 1567—1619, and who rejoiced in the long name of *Tcheou-tan-ts'ien*, which we have M. Julien's authority for contracting into Tcheou. This Tcheou was one of the most skilful artists of his time; and, possessing in perfection the imitative powers for which his countrymen have always been remarkable, he exercised his talents in making counterfeits of old porcelain; his tripods, pipkins, sacred vases, ornamented with animals and with laciform handles, so closely resembled the originals, that it was impossible for those not in the secret to distinguish the one from the other. They were eagerly sought after by collectors, who valued them as they would gold; in fact, as much as one thousand ounces of silver (7500 francs) have been paid for a single specimen. Tcheou was quite an original in his way, and delighted in carrying his beautiful vases in his own hands to the houses of those antiquaries whom he knew to be passionately fond of old china. M. Julien relates the following anecdote, which is equally illustrative of the character and wonderful skill of this artist:—

"Tcheou one day embarked in a merchant-vessel of Kin-Tehong, and repaired to the right bank of the river Kiang. As he passed Pi-ling, he landed to pay a visit to Thang, the president of the sacrifices,

and asked his permission to examine at his leisure an antique tripod of the porcelain of Ting, one of the ornaments of the president's cabinet. With his hand only he took an exact measurement of the tripod, then he took an impression of the veins or crackles with a piece of paper which he concealed in his sleeve. After which he returned to his abode at King-te-tchin. Six months after this occurrence, he paid another visit to Thang; drawing the tripod from his sleeve, he said, 'Your excellency possessed a tripod and pipkin in the white porcelain of Ting, I also have one which you now see exactly like it.' Thang, full of astonishment, compared the new with the old, which he had preserved with the greatest care, and could not detect the least difference; he fitted the tripod and cover of the new one to his own pipkin, and found that they suited with the greatest accuracy. He inquired whence Tcheou had obtained this curious antique. 'Sometime ago,' replied the artist, 'I asked your permission to examine at leisure your tripod. I took its dimensions in every part with my hands. I assure you that this is an imitation of yours; I have no wish to impose upon you.' The president, satisfied of the truth of these words, purchased Tcheou's tripod for forty ounces of silver (300 francs), and placed it in his cabinet by the side of the other, as if the two had originally formed a pair. The tripod of Tcheou was afterwards seen by one Thou-khieou, who was seized with a passionate desire to possess it. By day he could think of nothing else, by night he dreamed of it. At last, overcome by his entreaties, Thang yielded the tripod to him for the sum of one thousand ounces of silver (7500 francs, or, according to M. Natalis Bondot, equivalent to 25,000 francs at the present time) [£1000 sterling], and the delighted collector carried away his treasure to enrich his own cabinet."

Among other artists of this period was Ngeou-kong, who distinguished himself by his imitations of the crackle porcelain of "the elder brother," of "the Mandarin china," and the porcelain of Kimu. The most esteemed specimens of his works were the veined china with the red and blue enamel. A more original artist was he who called himself, "On, the old man who lives in solitude." He withdrew from the world, but produced in his retreat vases of the finest quality, and most elegant form. His most celebrated productions were the saucers ornamented with clouded diapering, and the cups of *egg-shell china*, which were eagerly purchased at any price. The ware called "the vases of On" were elegant and in good taste, generally of pale blue, but without crackles; in imitation of certain old china, some were coloured with purple and *feuille morte*. Thang-in-Siouen, who flourished between 1662 and 1722, was the maker of the porcelain known to collectors by the following names:—1st, green of the snake's skin; 2nd, yellow of the eel; 3rd, fine blue; 4th, yellow spotted. Nien, the director of the imperial manufactory at King-te-tchin, between 1723 and 1735, was no less remarkable for the care with which he selected his materials than for his skill in the fabrication of porcelain.

We conclude our notice of the Chinese artists with a short account of *Thang-ying* (1736—1795), the co-director with Nien of the imperial manufactory, and who is said to have surpassed all his predecessors in his successful imitation of old china, and the ingenuity of his own inventions. "He recommenced," say the Chinese writers, "the fabrication, long discontinued, of the jars ornamented with dragons and the porcelain of Kimu, and restored many of the old processes. Thanks to him, the grounds of dark blue and of brilliant red were again produced, and were much admired. Thang was indebted to his own genius only for the greater part of the wonderful processes which he adopted. The emperor, admiring the beauty of his works, and the improvements he had introduced, commanded him by a special decree to publish in twenty-two plates, accompanied by proper explanations, illustrations of all the different processes employed in the manufacture of porcelain." The fifth book of M. Julien's work contains the commentary of *Thang-ying*, which is said by one of his contemporaries "to bear throughout the stamp of intelligence, of talent, and of genius." Unfortunately, the imperial library at Paris does not possess a copy of the plates above-mentioned; but the translator has endeavoured to

remedy this deficiency by the introduction of other plates of the same nature, selected from albums in the imperial library.

The next part of the work will, we are sure, obtain the approbation of all collectors of old china. It consists of a catalogue and explanation of the principal marks which serve to distinguish the productions of different periods and different artists from others. For these we must of course refer to the work itself. It may, however, be interesting to the reader to know that these marks are of two kinds: "the first denoting in Chinese characters under what part of a reign certain vases were manufactured; but without indicating, in general, the date of this period, which always includes a certain number of years. The second mark expresses, either by a peculiar design, or by figures in enamel colours, the names of men or of manufactories; and indicates the name of the artist, the place where the piece was made, or its destination."*

As an illustration of Chinese habits and manners, we shall continue M. Julien's explanation of the marks indicating a reign. He observes:—"When a monarch ascends the throne, as he has no proper name of his own during his life, he gives to the reign which is about to commence an appellation which serves to designate not only the emperor, but the whole period or any number of the years of his reign. Thus the words 'the splendour of the right way' expressed not only the name of the last emperor, but were intended to characterise the wise administration which was to prevail during his reign. The words 'universal abundance,' which designate the present emperor, presaged in the mind of the young monarch an era of prosperity which, owing to the sanguinary character of the revolution, has never been realised. When the emperor Tchén-tsong, who ascended the throne in the year 995 A.D., had founded, during the period King-te, the celebrated porcelain manufactory at Tehang-nan-tchin, he ordered that on every piece of porcelain there should be inscribed four words, which signified 'made in the years King-te' (1004—1007). But it happened, unfortunately, that the custom of dating the porcelain instituted by this monarch, after having been in use for upwards of six centuries, was suddenly discontinued by a prefect of the district King-te-tchin. This worthy (in 1677) prohibited the manufacturers from inscribing in future on their porcelain the names of the years, or from recounting the actions of great men—under the pretext that, if the vases should happen to be broken, the emperor designated by the period of his reign, and the holy personages reproduced in the painting, would be subjected to a kind of offence or profanation."†

M. Julien next gives an account of the geographical distribution of the porcelain manufactories; which is rendered clearer by a map made expressly for the work, and in which the locality of the different establishments is indicated. He informs us that thirteen out of the eighteen provinces of the empire contain manufactories, which are much more numerous in some provinces than in others. The location of the manufactories he considers to be dependent on the abundance or scarcity of the materials required for the composition of the porcelain. The English general reader would gain but little information from a mere list of the porcelain establishments; it will be sufficient to observe that they are most numerous in the northern and eastern provinces, especially in those of Kiang-si and Teh-kiang. We shall now mention a few of the most celebrated manufactories. The first in point of antiquity is Sin-p'ing, in the province of Ho-nan, the seat of the first manufactory of porcelain. The factory at Nanking is, perhaps, the best known in this country. Its celebrated blue ware is familiar to most persons. There is some doubt, however, whether much that bears this name is not made at Japan. The famous porcelain pagoda is in or near Nanking. The manufactory which usually supplies the European and Indian trade is situated to the west of Canton, but the articles produced are greatly inferior to those of the next mentioned place. The most important of the porcelain manufactories are situated at King-te-tchin, a town or village of immense extent in the province of Kiang-si, and for upwards of eight centuries the seat of the imperial manufactory. This large village, which only wants

walls to be considered a city, contains more porcelain works than any other district of China; almost all the inhabitants are employed in the works. In the time of Père d'Entrecolles it contained eighteen thousand families, or about one million souls. It will interest the reader to know that the Chinese work, translated by M. Julien, was written with the professed object of giving an historical and descriptive account of the different kinds of porcelain made in the imperial manufactory of this town. We must find room for the following description of King-te-tchin by the Père d'Entrecolles:—

"King-te-tchin extends for a full league along the bank of a fine river. It is not a mere assemblage of houses, as one might imagine; on the contrary, the streets are laid out with regularity; they intersect each other at certain distances; the whole of the soil is occupied, and the houses are too close together and the streets too narrow. They are so crowded as to resemble a perpetual fair; on every side are heard the cries of the street-porters.

"The expense [of the porcelain works] is much greater at King-te-tchin than at Jao-tcheou, because it is necessary to bring thither not only all the materials, but the wood for heating the furnaces. Yet, in spite of the dearness of provisions, King-te-tchin is the abode of a multitude of poor families who cannot maintain themselves in the neighbouring towns. Even the young and the feeble find employment: the blind and the lame grind the colours. In former times, says the history of Feou-liang, there were but three hundred furnaces at King-te-tchin, now there are quite three thousand. It is not surprising that there should be many conflagrations; and it is on this account that the genius of fire has so many temples there; but the worship and honours paid to this divinity do not diminish the number of fires. A short time ago eight hundred houses were burnt. If one may judge by the number of masons and carpenters employed in that district, they were soon built up again. The profit derived from the rent of shops renders the Chinese very active in repairing damage of this kind.

"King-te-tchin is situated in a vast plain surrounded with high mountains. Those on the east, at the back of the town, form a kind of semi-circle; from the mountains on the side issue two rivers, which unite their streams; one is small, but the other is very broad, and forms a fine port, or basin, nearly a league in extent, where its rapidity diminishes. In this large space may sometimes be seen two or three rows of boats moored close together. Such is the spectacle which is presented when one enters by one of the gorges into the port. Whirlwinds of smoke and flames, which rise from different points, mark the length, the breadth, and the boundaries of King-te-tchin. By night one could fancy that it was a town in flames, or an immense furnace with many openings. Perhaps this mountain boundary forms a situation adapted for porcelain works.

"It is astonishing that a place so populous, so abounding in riches, frequented by so many vessels, and not enclosed by walls, should be governed by one mandarin only, and that there should not be the slightest appearance of disorder. It is true that it is only one league from Feou-liang, and eighteen from Jao-tcheou—but the local police is admirable. Every street has a chief established by the mandarin, and if the street be a long one, it has several. Every chief has under him ten subalterns, who each preside over ten houses. Their business is to maintain order, to attend the first appearance of tumult, and to give notice of it to the mandarin under pain of the bastinado, which is liberally applied. Frequently it happens that, although the chief has done all in his power to appease the tumult, and alleges that he has done everything he could to allay it, there is always a disposition to blame him for it, and it is difficult to escape chastisement. Every street is closed at night by barricades. The larger streets by several placed at intervals. One inhabitant of the quarter mounts guard at every barricade, and he dares not open it but upon certain signals. Besides this, the presiding mandarin, and sometimes even the mandarin of Feou-liang, patrol the town. No strangers are permitted to sleep in King-te-tchin. They must either pass the night in the vessels, or lodge with persons of their acquaintance, who are answerable for their conduct. This rigorous police maintains perfect order, and establishes entire secu-

rity in a place whose riches would arouse the cupidity of a multitude of thieves."*

The administrative organisation of the manufactory is as well regulated as that of the town. It is probably enforced by severe discipline. In their efforts to preserve order, the Chinese do not always consider justice or humanity, and cut off a man's head with as little compunction as they would that of an onion. The labourers are divided into bands, each of which is under the control and superintendence of a person who is answerable for the conduct and diligence of those who are under him. It would appear that the pay of the labourers is regulated by that of the articles made, for it is stated that in order to facilitate the calculation of their wages, the cost of its manufacture is stamped upon every article. The workmen receive their wages in the fourth and tenth months, and a gratuity at the end of the year. The painters, who are workmen of the first class, receive their pay four times a year. Besides the regular wages, every workman in King-te-tchin receives, on the day of the new moon in the third month, an extra allowance, which is called "market money, for the purchase of rice."

Whether manufactories of any kind, which are immediately under the control of government, are always advantageous to the nation in an industrial point of view, is a question which does not come within the scope of this article. The porcelain manufactory at Sèvres, and the Gobelins tapestry-works, are proofs that these national or imperial establishments are sometimes beneficial; that they are not absolutely necessary is seen by the prosperous state of our own manufactures, which depend for their advancement on the talent and energy of private individuals, and for their maintenance on the support of the country at large. The great advantage of royal manufactories appears to consist in this:—that, as the object of the government is to improve the articles manufactured, and not merely to sell them at a profit, national establishments can afford to expend more time and money in the prosecution of experiments than private individuals; and the rewards they hold out to men of talent enable them to secure the assistance of the most able professors and workmen. The imperial manufactory at King-te-tchin, although it appears to have been attended with the advantages alluded to, had, certainly, very much the character of a monopoly. Several kinds of porcelain were ordered to be made for the exclusive use of the emperor, and were distinguished as such by a particular mark; at all times the finest specimens were selected for his use.

It was probably advantageous to the porcelain manufacture that in the period Tchi-te (583) of the dynasty of the Tchin, the emperor ordered the inhabitants of the place now called King-te-tchin, to pay their tribute in porcelain vases of a particular description. Among so many workmen there would of course be dishonest ones, and the inducements offered by private manufacturers were frequently sufficient to induce them to betray secrets, to purloin materials, or otherwise to consult their own interest instead of that of the imperial manufactory. "When," observes a Chinese writer, "the workmen had received an order for the palace, they either furnished the objects required or paid a fine, and worked on their own account. This is the reason why the only flourishing manufactories are those of the people; yet there are very few of these artists whose names have been preserved." "In every manufactory," continues the same author, "there was a register, in which was entered all the porcelain manufactured; those persons who made any clandestinely were rigorously punished. Is not this a convincing proof that porcelain paid duties into the treasury?"

The greatest vigilance on the part of the authorities could not always prevent the workmen from appropriating valuable colours. The governor of Yun-nan, it seems, monopolised cobalt blue, on its first importation from the West, for the use of the imperial manufactory; but when the beauty and importance of the colour were discovered, the workmen, from sordid motives, stole what they could of it, and sold it to private manufacturers. Very rigid enactments were made in consequence, and at last succeeded in putting an end to the practice.

* "Lettres Edifiantes," quoted by M. Julien, pp. lxi-lxiv.

If the Chinese emperors were monopolists, it must be acknowledged that they were also very good customers to the porcelain manufactory. The early Chinese work on the manufacture of porcelain, already mentioned as having been published in 1325, and as having passed through twenty-one editions, contains a list of five pages quarto of the porcelain that had been furnished for the use of the emperor. M. Julien enumerates a few of the items; the numbers of each article are enormous:—31,000 dishes ornamented with flowers; 16,000 white plates with blue dragons; 11,250 dishes with white grounds, with blue flowers, and dragons holding in their claws the two words *Po* (happiness) and *Chien* (longevity). The increase in the next article is remarkable, and indicates either a great consumption of wine, or a peculiar fragility in the ware used for this purpose; it is as follows—184,000 cups for wine, ornamented with flowers, and with dragons in the midst of clouds.*

In the porcelain manufactories in China and Japan the division of labour is strictly enforced: a simple cup or saucer passes through seventy-two hands before it is finished:—

"Every kind of round vessel, ornamented with blue flowers, is manufactured by hundreds and thousands. If the paintings are not identical, the irregularity will produce an unpleasant effect. For this reason he whose business it is to make the outline does not study the art of applying the colours; and on the other hand, he who applies the colours cannot draw. By this means the hand is exercised on one thing only, and the attention is not divided. Those who sketch and those who paint are placed by themselves in the same atelier, in order that their work may be uniform."

The author then goes on to enumerate the different workmen, all of whom are confined to the use of one tool, or to the performance of one operation. There is no doubt that this arrangement is advantageous to the manufacture, for practice makes perfect; but the effect on the workmen themselves must be far from beneficial; it converts them into mere machines, which are ever repeating the same monotonous action. Where no inducements are held out to the workmen to improve the processes, the duller man, if industrious, may be as well paid as the most intelligent; and the intellect that is not awakened by exertion, and stimulated by the hope of reward, is sure to retrograde.

The manufacture of an article which passes through so many hands and so many processes as porcelain, must necessarily be attended with much uncertainty and occasionally with failures, not to mention the accidents arising from the extremely fragile nature of the composition. In order to meet these inconveniences, the Chinese manufacturers find it necessary to make double the number of articles required. The difficulties are much increased where the articles to be made are of large size—and some of the vases with covers are nearly two feet and a half in height. Some idea of the extent of the manufactory may be formed from the statement in the Chinese work that an order is sometimes received for 500 or a 1000 of these large jars, for 500 large vases for the gardens, and 300 for flowers; especially when it is considered that the number made must actually be double what is required, in order to allow the manufacturer to select the best articles, and to reject all that are broken and defective.

In connection with this last subject we find in our Chinese work some curious statements and observations. It appears† that all defective articles of every description are thrown into a heap, where they remain until they are purchased at a valuation by some itinerant dealer. Many persons, it is stated, have become rich by purchasing these rejected articles. There is at King-te-tchin, continues the Chinese author, a class of men extremely skilful, who collect defective articles from the manufactory; they polish on a wheel those which have uneven surfaces, and repair those which are cracked or broken. There is a certain kind of porcelain described as "porcelain to which has been given a false lustre," which, although not broken, is full of concealed cracks. Men who are adepts in deception purchase these at a low price, and coat them with some preparation which, for the moment, consolidates them; but they

* Page lxxix.

† Page 272.

fall to pieces as soon as boiling water is poured into them.*

Notwithstanding the care with which the Chinese endeavour to preserve all their processes, several of them have been unfortunately lost. Among the latter is a curious process which Père D'Entrecolles thus describes:—"The Chinese," he says, "had the art of painting on the sides of a piece of porcelain fish or other animals, which were not visible until the vessel was filled with some liquid. The following account embodies all that is known respecting this secret. The porcelain to be painted should be very thin. When it is dry, the colour is laid on with great strength, not on the outside, as usual, but on the inside of the sides of the vessel. Fish being most appropriate are usually chosen for this purpose. When the colour is dry, a thin coat of the porcelain paste is applied over it; and this serves to enclose the azure [colour] between two layers of porcelain. This is suffered to dry; when the glaze is applied on the inside. After some time it is put on the wheel, and the outside is ground as thin as possible without laying bare the colour. It is then enamelled on the outside, and fired in the usual way. The work is extremely delicate, and requires a degree of skill which apparently the Chinese no longer possess. They make attempts, but in vain, to recover this magic art. One of them, however, assured me that he had again tried, and almost succeeded."†

The memoir relative to the porcelain of Japan is, as before observed, a translation by Dr. Hoffmann, from the Japanese language. It is part of a work in that language entitled, "Representation and Description of the most Celebrated Productions, Terrestrial and Marine," which appeared in five volumes, accompanied by illustrations, in 1799.

The porcelain manufacture of Japan was founded about B.C. 27, by some emigrants from the peninsula of Corea,—descendants, it is said, from the dynasty of Tsin, who were expelled by the Han dynasty (B.C. 203). This art, observes M. Hoffmann, possessed by the new colonists, may be considered as one of the elements of Chinese civilisation and industry, which procured for these colonists a marked preponderance over the other inhabitants of Corea. Like many other elements of Chinese civilisation, it passed from Corea to Japan. But the art was far from making in Japan the progress it had done in China until, in 1211, a Japanese manufacturer, accompanied by a bonze, repaired to China, and learned all the secrets of the art; so that, on his return to Japan, he was able to manufacture some objects that were much admired. As late as the end of the 17th century, a Japanese prince brought workmen from Corea to make the porcelain called Faqui-yaki. For several centuries Japanese porcelain has formed an important and valuable article of commerce, and now ranks, with its lacquer-work, among the most beautiful articles of oriental industry. Japan porcelain is of more recent introduction into Europe than Chinese, and was probably unknown in this country until the latter half of the 16th century. The best of the many kinds of porcelain made in Japan is that known as Imari-yaki. It is not made at Imari (a much frequented port of the province of Fizen), but in the factories, twenty-four or twenty-five in number, situated on the declivity of the mountain Idsonmiyama, whence is procured the white earth of which the porcelain is made. Some of the best productions of Imari are imitations of Nanking china; and the earth of which they are made, though procured near Imari, is called Nanking earth.

The system of the division of labour, so generally carried out in the Chinese porcelain works, prevails also in Japan. Dr. Hoffmann states that every work, even the smallest saucer, passes through the hands of seventy workmen, from the moment of forming the paste until it has received the last finish. The blue substance used for colouring the Nanking porcelain, as it is called, is brought from China; it is a native mineral, consisting of a cobaltiferous peroxide of manganese.

We propose in a future number to give a brief description of the composition and mode of fabrication of the Chinese porcelain, and of the pigments employed in painting the china; preceding our notice by a few general observations suggested by the perusal of the work. M.

THE ROYAL PICTURES.

MILKING TIME.

P. Potter, Painter. J. Godfrey, Engraver.
Size of the Picture, 1 ft. 9½ in. by 2 ft. 6½ in.

PAUL POTTER, a native of Eindhoven, in North Holland, was born in 1625. In his history we find one among the many examples which might be adduced to prove that a long life is not essential to gain an immortality of renown. Struck down by consumption ere he had reached his thirtieth year, he yet had accomplished in Art what will for ever ally his name, in his peculiar walk, with the greatest painters of any age or time. We scarcely pass too high an eulogium upon him by saying that, as a painter of what the farmer would call "stock," he stands without a rival; and this opinion is given with a full appreciation of all which both his countrymen and our own have produced in this way. Next to the extraordinary faculty with which he was endowed—for even at the early age of fourteen he exhibited such proofs of talent as to be considered a prodigy in his profession—the great success of Potter may be attributed to his constant and close study of Nature. It has been truly said that "she was, indeed, his nurse in childhood, his mistress in youth, and his constant companion to the end of his days. He bestowed unremitting attention on every object and circumstance that might tend to give heauty or picturesque effect. The dawn of day frequently found him in the field. The dewy freshness of early morning, the dazzling brightness of the mid-day splendour, and the glowing refulgence of the declining sun, together with the variable appearance of the atmosphere, resulting from mists, rain, and wind, are depicted with unequalled truth by his magic pencil."

When about twenty years of age, Paul Potter went to reside at the Hague, but the last six or seven years of his life were passed at Amsterdam, where he died in 1654. In Mr. Fairholt's article, "The Home of Paul Potter," published in the number of the *Art-Journal* for May, the reader will find an excellent account of this fine painter, and of the country which was his studio.

Although he left comparatively few pictures behind him, about 150 genuine specimens have been assigned to him by connoisseurs who have made his works their study: the sizes of some, and the exquisitely delicate finish of almost the whole, proclaim the industry with which he laboured during his brief career. To the extreme beauty of his pictures, no less than to their rarity, must be ascribed the difficulty which the collector finds in meeting with them, and the high price he is compelled to pay when the opportunity is afforded for making a purchase. They may be valued at many guineas the square inch of canvas. Within the last century or longer, his paintings have wonderfully increased in value—for instance, one which was sold in 1780, at Leyden, for £495, in 1816 realised £1480. His famous work, "The Young Bull," now at the Hague, was sold at Haarlem, in 1749, for £57; it is now valued at 5000 guineas. "Four Oxen in a Meadow" was sold, in 1750, for about £25; in 1812, it rose to £320; and in 1815 was purchased for the late Emperor Alexander, of Russia, for about £2800; it is now in the Imperial collection in the Hermitage, St. Petersburg. Numerous other examples might readily be cited to show the increased value of Potter's pictures.

"Milking Time," or, "The Dog and her Puppies," as the picture is usually called by connoisseurs, has been universally classed among the leading works of this painter; Dr. Waagen calls it "Pleasing in composition, and admirable in execution." Its history and its gradual rise in value is traced back for a century in Smith's "Catalogue." In 1754, it was in the collection of M. Lormier, from which it passed into that of M. Braamecamp, who sold it, in 1771, for £364, to M. Randon de Boisset, who parted with it, in 1777, for £372. In 1800, it was sold from the collection of M. Geldermeester for £940. Whether or not it came at once into the Royal Collection, we know not, but presume that it did; it was exhibited at the British Institution in 1815, 1826, and 1827.

The picture is painted on panel; it is in the collection at Buckingham Palace.

A FEW WORDS

ON OUR NEAR NEIGHBOURS' TASTE AND OUR OWN.*

GENERAL DECORATION—TRAFALGAR SQUARE AND LA PLACE DE LA CONCORDE—COMMITTEES OF TASTE AND DIVIDED RESPONSIBILITIES—WRAN'S REJECTED DESIGN FOR THE MONUMENT ON FISH-STREET HILL—L'ARC DE L'ETOILE AND THE COLUMN AND TOMB OF NAPOLEON—PAINTED WINDOWS AND CLOCK-CASES—SIMPLE STYLES OF DECORATION MOST SUITABLE FOR ENGLAND—HARMONY OF A STYLE OF ARCHITECTURE WITH THE HIGHER EFFORTS OF PAINTING AND SCULPTURE A TEST OF ITS SUPERIORITY.

Present—MAGISTER and AMICUS.

Magister.—A great portion of Paris lives, by necessity, most humbly at home, and has to look abroad in the cafés and public places for all that is to please the eye; but when our neighbours do furnish their apartments, they do it with an elaboration unknown to us; and of this pictures and sculptures form but a small part. They are not content with two or three pictures and an ornamental clock, and a statuette or two in bronze or biseuit, but they try to make the whole room a work of Art—walls, doors, and ceilings. In this they do better than we, and are at least right in principle. We, on the other hand, are not ready enough to look on the lower classes of Art as of kith with the higher. Painting and Sculpture with us are inclined to ignore their less titled relations; on which account, as it lies in the way of their accommodating themselves to her ideas, Architecture, in her turn, is but too apt to ignore *them*—their own injustice hardly giving them a right to complain; and so the whole of Art suffers. In this the Art family might well learn from Æsop's "Fable of the faggot of sticks." It is only wonderful to me that the Arts, separate as they hold themselves here (like brothers and sisters not on the best possible terms), effect as much as they do.

Amicus.—For their domestic union then we must look across the channel, and learn from the French? *Magister*.—Or from any other nation or time in which Art has had free scope. Its best things have arisen when it has been conglomerate, and not dispersed.

Amicus.—I suppose decoration is so much a necessity of life with the Parisian that he would rather have his *cau sucré* in a handsome café than his "Chateau Lafitte" in a plain room!

Magister.—I don't know: eating and drinking is one of the Fine Arts in Paris, and they hold that as much harmony may be shown in a succession of "plats" as in the details of a picture. However, Fine Art is an essential there in everything—from the decoration of an Imperial Palace down to the gifts in every shop in welcome of the new year. At all times, however, half Paris appears to be employed in amusing the other half. To gratify the public eye is one urgent duty of government, and to employ their workmen is another, and these two requirements work well together.

Amicus.—For themselves and for the appearance of everything.—What a contrast the result presents to our capital!

Magister.—Paris puts his best foot foremost in making his first bow to the stranger. When you come to know him more, he is not quite so perfect.

Amicus.—Think of the Place de la Concorde!

Magister.—London has no *coup d'œil* like two or three that Paris presents, but building for building, I believe we are richer in fine examples—for instance, where are there parallels to St. Paul's or Greenwich Hospital?

Amicus.—But take the Place de la Concorde as one metropolitan centre—think of our Trafalgar Square as another centre, and be humble.

Magister.—In that we view the sad results of committees of taste. The National Gallery was built by a committee of taste; the square was laid out by a committee of taste; and that lamentable Nelson Column was stuck up in the midst by a committee of taste.

Amicus.—A committee being a body who commit themselves!

Magister.—Sometimes; and the public also, and the nation to which they belong. This is one of the evils of divided responsibility. And thus a despotism, a concentrated one responsibility, is often a state more favourable for evoking fine public works of Art than one where the onus is divided among many.

MILKING TIME

FROM THE PICTURE IN THE ROYAL COLLECTION

LONDON PUBLISHED FOR THE PROPRIETORS

Amicus.—But Athens was a republic, and some good things were done there.

Magister.—In name a republic, but ever practically a despotism under some one or other. A republic is often but a name for a succession of masters. In committees of Art *variety of opinion* has not unfrequently resulted in a *compromise of crochets*—a fine example of which is Trafalgar Square. To commence with the Nelson Column: it was the grossest possible mistake that could be committed, "within the premises," to put up such a tall object directly in front of the portico of the National Gallery—a monster column before a group of little ones; by which unfortunate arrangement, in approaching by Parliament Street, King Charles, the column, and the portico, are all in one line and one another's way; whereas it is evident enough that the centre front approach *should not have been interfered with at all*; and any high objects added should have been not *one*, but *two*—say one in memory of Nelson, and the other of Wellington, as brother heroes, one on the right hand and the other on the left, in front of the unadorned wings of the Gallery; leaving the portico, the *only really fine portion of that building*, unencumbered and free.

Amicus.—That indeed, seems "on the cards." It is a great pity it can't be all pulled down and done over again! and then you might have a centre "Fountain of Britannia," which would have been very proper for our isle-born goddess; and she might extend wreaths, naval and military, much as the figure of France does hers on the Palais de l'Industrie; and you might have other worthies on pedestals all round, and christen Trafalgar Square the "Place of the Heroes."

Magister.—I do not think a centre object of any kind was required or appropriate in Trafalgar Square. There was as much already in the centre line as could exist there advantageously, in King Charles's statue and in the portico. Whatever was added of a lofty character should have been *twain*, and have been placed on either side, where the fountains are.

Amicus.—And what poor specimens they are—I mean the fountains! How different to those in the Place de la Concorde!

Magister.—All that can be said for our two is, that they are not worse than nothing; and that perhaps they may lead to something better hereafter by accustoming us, in our public places, to fountains, which are subjects capable of so much high Art. Wherever you see a fountain, you see people amused with looking at it; there is something in moving water that is ever attractive, be it the waves of the sea, or a river, or a torrent, or the humbler Art-efforts of mau. The Place de la Concorde fountains are ornamental and pleasing enough, especially when they are both in full play in the warm, clear sunshine of a Parisian summer day.—I have nothing to say against them, except that they possess no marked originality. In truth to say, as a set off to our Trafalgar Square, I view the Place de la Concorde, in spite of your, and, I allow, general admiration, as no marvel in point of decoration. It possesses some naval bronze columns which are really good pieces; but on the whole, in the Art-decoration of that great place, which it is so much the fashion to praise, I suppose I am a great heretic, but I see little to admire. Its situation is everything that is delightful, but what has French Art done to enhance it? The just taste of keeping such a grand open space as a centre of the best part of Paris is unquestionable. But that acknowledged, what more has been done by French Art? What can be more indifferent than the colossal, heavy, sedentary cities of France ranged round the area (not one of them good either in design or execution) on ambiguous-looking compounds of pedestal and sentry-box; and as regards the centre ornament—the eye of the whole area—the culminating point of its attraction—the centre of the Art-centre of Paris, how has that been supplied? by their own Art-power? No! for this apple of the eye of Paris she had to go—at least, she chose to go—back to a work executed some two or three thousand years ago by a semi-barbaric race, and had to send all the way to Luxor for what was originally a unit of two decorations in front of an Egyptian temple. Assuredly, this manifests either a want of resource or a want of taste: a want of resource, if France could not herself produce a more appropriate and pleasing centre decoration for her vaulted square; and a want of taste if it could, and

notwithstanding placed there this great splinter of granite.

Amicus.—Well, they are very proud of it; and the feat of erecting it there has been thought worthy of being inscribed in letter and diagram on the base.

Magister.—The same thing having been done in Egypt, ages ago, without their thinking it worth while to say anything about it. That I am very well pleased to stop awhile in the Place de la Concorde when I am in Paris, and look about me, I won't deny; but my pleasure certainly does not arise from the scheme of its Art decorations—for, indeed, it is in my idea very short of what it might have been, especially as regards originality; and I must add that, though there is a vast deal to admire in French public works, originality does not seem their strong point. The Napoleon Column is a copy of Trajan's, the Arc de l'Etoile a compromise between the arches of Titus and Septimius Severus, and the same remark applies, though in less degree, to the Madeleine and the Bourse—which, though impressive from their size and the amount of judicious labour of various kinds bestowed upon them, suggest their types at once.

Amicus.—We can't say much for the originality of our columns—those of Nelson or Duke of York, or that on Fish-street Hill!

Magister.—But that on Fish-street Hill was not the one the great Sir Christopher desired to put up: his design was truly original—a column on fire! a type of the Great Fire of London it had to commemorate—with gilded flames out of the windows of the staircase, forming a spiral succession of decorations up to the top, with a beautiful architectural fial of a phoenix rising from its ashes, to typify the rebuilding of the great city on an improved plan. I know not which to admire most in the design I have seen of this—the appropriateness of the thought, or the beauty and fitness of the architectural proportions and detail. The one that now stands on Fish-street Hill, with its sheaf of fire on the top, was erected to meet the wishes of others, not his own.

Amicus.—I suppose there was a committee!

Magister.—Perhaps so; however, it was not the artist's fault; had his wishes been followed, London might have boasted a *thoroughly new column*, a real addition to the architecture of the world—which certainly the Napoleon Column is not. As to the Arc de l'Etoile, its details are good, but its outline is not of a nature suited to its scale; its only originality is its size, and that is, I conceive, a mistake, and a mistake you can hardly get rid of in any part of Paris; for, from its elevation of situation, its huge box-like outline and mass, it asserts itself in every quarter of Paris, dwarfing the very town it is an introduction to, and the approach it should enhance.

Amicus.—Like a large lodge to a small house. But it serves more than one purpose—at least I have been told it is a barrack, and has accommodation for a thousand soldiers.

Magister.—As a colossal guard-room, its size may be useful; but viewed merely as a work of Art, I conceive it to be much too big.

Amicus.—Its proportions are certainly enormous, which is the reason, no doubt, that, like a mountain, no picture or representation gives you a just idea of its size.

Magister.—No; it is hardly till you are ascending it that you can realise this. Its greatest virtue is the ample and beautiful view its summit affords of Paris. However, some of its sculptures are very good—those on the Paris side especially. The group of War is the best, very well composed and extremely splendid—indeed, one of the best specimens of modern alto-relievo, and so recognised in Paris, for you see many a print and photograph of it.

Amicus.—What do you think of the tomb of Napoleon, in the Chapel of the Invalides?

Magister.—The arrangement of the sarcophagus in the open crypt—if it may be called a crypt under such circumstances—and all under the dome, is very fine as you look down on it from above, and was a noble thought. Nothing can be more simple and impressive than this part of it is; but I cannot extend my admiration to the gewgaw and rococo of the screen, or to the *charlatanerie* of the blue and orange lighting—the same thing, only on a larger scale, that is done in the cenotaph of the Princess Charlotte at Windsor. The tableau effects of fairy light are now so artistically rendered in theatrical extravaganzas,

that rivalry with them is ill-judged enough, especially as associated with solemn subjects.

Amicus.—But were this done away with, surely a good deal of the whole effect of the tomb would be lost. It appears to me that much of the impression depends on the peculiar light that is cast on all around.

Magister.—But its very effect fades when the eye gets accustomed to it; the impression it makes does not remain. I give all honour to the thought of the tomb under the dome, and to the circular open vault; but the artifice of the light is not a worthy one in my estimation, and lowers instead of raising the subject with which it is associated.

Amicus.—But why is it worse than other painted windows which we admire in other buildings?

Magister.—They are works of Art in themselves, either as pictures or decorations—the lights they cast are but their secondary effects.

Amicus.—But these secondary effects are surely among their most beautiful results? Milton's "dim religious light" was one tinted by the hues of painted glass.

Magister.—I would not say that painted windows are not appropriate in other buildings than Gothic ones; but assuredly they form a true portion more of that style than of any other, for the pictures in that style of architecture naturally go into the windows. They are these architectural illuminated missals: thus the varied tints arising from them in Gothic interiors are peculiarly harmonious. At the same time they are to be considered as incidental rather than as primary efforts. Even in a Gothic building I should not like *plain coloured glass without subject*, merely for the sake of the tint it would throw; the artifice would be too evident, as it is in the tomb in question.

Amicus.—However, the architect had to please the public, and the Parisians like it.

Magister.—A great man like Visconti might have afforded to lead the taste. But on the whole, the tomb of Napoleon is a most excellent work, and I hope we may have something half as noble for Wellington in St. Paul's.

Amicus.—But that would be impossible, unless they should put it under the centre of the dome in the same way; and that could never be done, I suppose, for various reasons.

Magister.—Over the centre of the crypt, where repose the ashes of the great Duke!

Amicus.—And of Nelson too. And does not this suggest a united monument?

Magister.—Which would be commemorative too of both naval and military service?—Assuredly. But how could that be done? St. Paul's has already a monument to Nelson by Flaxman, and that could never be ignored.

Amicus.—Well, there seems a great opportunity somehow for something very grand and very new.

Magister.—And very British too, I hope, with no importation of foreign taste unsuited to our simplicity, as coloured windows; but chaste, dignified, explicit, and Anglo-Saxon.

Amicus.—And no French taste in it, I suppose? By-the-by, we use the expression French taste in opposite senses (like the word "nervous"). We use it for praise and for blame: we exclaim, "What a charming display of taste in the French capital, and in the getting up of its festivals; and how tastefully French women dress!" All the goods and bads in our shops are called French to sell them; and yet, on the other hand, if anything offends, as too artificial and elaborate, the cry is "That's too French."

Magister.—All that too without stopping to remark whether what is reprobated is really French or in French style. Our attention to substantialities having allowed our neighbours to get beyond us in details of effect in the ornamental Arts generally, forces our respect to them in these in great degree—hence the use of the expression "French taste" as *praise*; on the other hand, our innate love of the virtue of simplicity repelling us from the artifice and amount of over-elaboration which we so often witness in foreign works, and which we feel not to be the right thing, although we do not as yet quite know what to put in their place—hence our use of the expression "French taste" as *blame*. It cannot be denied, indeed, in viewing that part of Art in which we are considered especially deficient—Decorative Ornament applied to Manufacture—that there is hardly a French design which we wholly approve for its taste, although we buy it for its details, and

because on the whole we cannot get anything so good in effect for the same price. Take clocks, for instance—I mean ornamental clocks for drawing-room mantel-shelves—did you ever see a French one thoroughly satisfactory to English taste? I never did. I am sure there is a good field now open for a manufacturer in that branch of trade, to take up the making of clock-cases for the English market, and specially to suit English taste. We make the best movements; why not the best cases? Such a trade would advance British formative decoration in more ways than one. A clock is an important feature in a room, and consequently people will pay more for clock-cases than they will for other things in proportion. In Paris, a high class of skilled workmen is mainly supported by the production of these, which are sold to all the world; and the talent so evoked, is occasionally turned over to other decorative objects; and thus the advantages of the “pendule” manufacture are spread over a large surface of formative ornament, especially in metal-work. Why might not this be the case here? The demand in Paris for statuettes and high-class decorations for clock-cases rears up a corps of modellers, fitters, casters, chasers, and bronzists, all working into one another’s hands. Thus the modeller lays out his figures so that it shall *cut*, or divide into pieces, so as to be, firstly, easy to cast—secondly, easy to fit and screw up together, and have its textures so arranged as to be effective in colouring; moreover, he calculates on the effect of the ebasings—not finishing too much, but leaving only certain portions to be thus touched forcibly and effectively. Now all this working together, by which the greatest amount of effect is produced at the least possible price, is only to be obtained by the various individual talent required being employed *in unison on continuous work*. This is in France, and might be here, the result of a speciality; and as I said before, I do not know a more promising scope for an enterprising and intelligent manufacturer to take up than a “pendule” manufacture, simply because there is a want to be supplied; for if an Englishman wants a handsome ornamental clock for his chimney-piece, he really does not know where to get one to please him.

Amicus.—Then here at once you would enjoin that the path of French taste should be quitted, and this in a department which they have long held as especially their own?

Magister.—You asked me some time ago if I thought French taste really healthful for us, and this is an example of what I think on this head—viz., that French taste is rarely thoroughly in accordance with ours. I will own that most frequently French articles of decoration are all extremely attractive at first; but it is very rarely they will stand the test of pure taste and examination. In looking closer you feel this part is redundant, and ask yourself the question, “What has that other part to do with it?” And then in fancy you begin to lop off this, and to lop off that, till, lo! at last nothing remains. The most showy French ornamental articles are decked out in this way with a redundancy, of which the ingenious confusion alone hides its inconsistency. Now this is not the mode in which really fine things are done—things that you are never tired at looking at—fitted to be standard friends. After looking carefully at the subject of French decoration, out of the multiplicity of attractive designs at first sight, you will find but very few that are really satisfactory, like the fine things of Greek and Roman Art; and, moreover, even in their arabesques, a pruriency is often apparent. The composite creatures, and fragments of creatures, introduced in their designs being scarcely delicate, *which is certainly not good taste!*

Amicus.—Then if we are to have a national style it is to be a simple one—is it also to be a new one?

Magister.—As to a national style being altogether a new one, the world is too old, I fear, and the human intellect has been too long employed on such matters for it to be that. The French materials for their Art *envisée* are from all styles, from Greek to Chinese; the flavouring, however, is their own: and we must do the like, perforce, at least in degree, for we have no reason to disbelieve that nearly all the best elements of decoration have been grasped already. The distinction might be, as our neighbours select usually the more decorated elements, we should choose the more simple.

Amicus.—But be copyists after all?

Magister.—There is less variety, or rather, perhaps, a less number of simple *elements* of decoration than you may be at first aware of; you find them existing in common in all styles. It is chiefly in re-arrangement that we must look for novelty. This offers a far wider field than is at first sight to be appreciated; but I by no means by this deprecate novelty—very far from it; only I would say that a moderate introduction of novelty in ornament, whether suggested by fresh natural objects or individual invention, is sufficient to satisfy, and more likely to steadily advance our productions than a rushing after something altogether new. But I should add, as Englishmen, let us ever keep simplicity in view, and never put more ornament than is wanted, but let the little we put be of the best.

Amicus.—Then, if it be injudicious to start off at once after a new style, which is the style that you think at the present day is most in accordance with our tastes and requirements? I do not mean to be followed to the exclusion of the others, but to be most leaned to.

Magister.—In considering the question so, one cannot speak without reference to Architecture, as that is the case and frame of almost all kind of Fine Art: the other Fine Arts, whatever may be their relative height as displays of intellect, being fixed into it as one common setting, of which they are the adjuncts as well as gems. I should say then that the simpler class of Italian architecture was the most suitable for us generally, and that this would give a good keynote to the greater part of our other Arts, as far as they may be effected by periodic styles. The higher walks of Painting and Sculpture hold themselves somewhat aloof from periodic styles, and are cosmopolites both of country and time; but in as far as they are affected by contemporaneous styles of architecture, they would, I truly believe, be benefited by keeping in mind the simple, effective style of Italian Architecture—in connection with which the best pictures we have were produced.

Amicus.—And the best sculptures with the Greek.

Magister.—I am not sure of that with respect to a considerable number of them. I believe many of the statues viewed as having been done in Greece were done in Rome, although perhaps by Greeks. We know the Antinous was—But to return. In this country I should prefer to see most prevalent a style approximating to the simpler examples of Italian. I apply this especially to Architecture, but through it also to the other arts of Painting, Sculpture, and Decoration. This class appears to me almost to claim the name “European,” it lends itself so well to all our exigencies. It is so useful as well as so strong, so simply ornamental. It is constructed of the noblest simple forms—the single column, the wall, the true arch, the dome. It affords most effective and varied light and shadows, and the opportunity for the employment of the most varied materials; it also suggests and offers starting-points, and affords spaces for the noblest class of decorative ornament; and last, not least, associates itself better in my belief than any other style with the highest class of Painting and Sculpture.

Amicus.—Then it was a great pity the Houses of Parliament were not in that style, as that is the largest field for the encouragement of the higher classes of the Fine Arts?

Magister.—Indeed, I think so—even as far as Architecture itself is concerned; although Gothic is a charming style for some edifices, and to be largely, though, I think, not exclusively, used for ecclesiastical edifices (for is our Christian creed of universal love to be restricted to one style of edifice?) Certainly it is not fitted for our Houses of Parliament. Why, from the very debates there uttered rhetorical ornament is banished, and good substantial straightforward sense is now what is alone sought and attended to: and yet the building in which these are conducted is one mass of elaborate ornamentation—all over crotchets, and finials, and grotesques, of which the infinity, outside and inside, bewilders the eye, and makes the very sense ache even while we admire the resources of the accomplished architect. No; I would have had the style of the Houses of Parliament like Whitehall or Greenwich Hospital—plain, substantial, and effective as common sense itself. Moreover, half the money employed in the over-elaboration of the style of the present building would have afforded funds for the noblest additions of our highest Arts to this national monument, had

this simple character been at first adopted. For association with the sister Arts, this style offers peculiar advantages, and is in our climate better perhaps in this respect than even the revered Greek; but poor Gothic, when she attempts to receive her sisters, Painting and Sculpture, in their highest phase, *her best welcome is but a compromise*. There seems, indeed, to be an innate quality in Gothic that can only keep company with a degraded, and pinched, and monastic, and heraldic class of Painting and Sculpture. I like to see the highest efforts of all the sisters together; and so I cannot but lean to that style that affords the freest scope for this. Indeed, it appears to me a fair test of the eminence of a style of architecture—its uniting naturally with the highest class of Painting, Sculpture, and Decoration.

CORRESPONDENCE.

DURABILITY OF WATER-COLOURS.

SIR,—There is a remark in the *Times* newspaper of April 21st, tending to convey an erroneous impression as to the relative permanency of Works of Art executed in water-colours: in a criticism on the Exhibition of the New Society of Painters in Water-Colours, the following passage occurs:—“the ambitious artist will employ a more enduring vehicle,” by which the writer evidently means “oil colour.”

As an observation of this kind, if allowed to go uncontradicted, might have the effect of prolonging the existence of a now nearly exploded idea, that water-colour paintings are less durable than those executed in oil, I trust that you will allow me, through the medium of your very influential Journal, to submit a few remarks for the purpose of showing that the *Times*’ critic is mistaken in this particular.

That “the ambitious artist” may prefer oil-colour, I do not dispute; but I venture to assert that it is not on account of superior permanency that oil-colour can claim to be preferred,—unless the term “enduring” is employed to signify that pictures painted in oil will bear a larger amount of rough usage than those painted on paper in water-colours, without being damaged thereby; but if it is the preservation of the artistic thought unchanged that is meant, then I submit the advantages are greatly in favour of water-painting.

In both methods, the colours employed are the same (with the exception of white lead, which is neither necessary nor suitable to water-colour); the difference lies in the vehicle used to convey the pigment and fix it on the ground. In water-painting, watery solutions of gum-arabic or senegal are all that are necessary for that purpose, and for imparting transparency to shadow colours; in oil-painting, resinous matters, oils, &c., are used,—neither will impart durability to colours that are fugitive, or, in other words, liable to chemical decomposition by the action of light. Permanency depends on the judicious selection of such as are not likely to fade or “fly,” as it is technically called, and on securing the same in a vehicle not liable to discoloration by time. In the latter, gum has greatly the advantage over oil.

It cannot be denied that oil-colour has certain advantages over water-colour: there is a depth of shadow and a command over the material, to which water-colour has, as yet, no pretensions, and these qualities alone would make oil-colour a preferable vehicle for “ambitious” productions; but in durability, as well as in light and aerial effect, water-colour, as now practised, confessedly stands pre-eminent.

That many of the oldest works of the early water-colour masters have sadly faded cannot be doubted; but those were painted in the days when sap-green, bices, Spanish-liquorice, tobacco-water, &c., were considered to be proper colours to be used in “Water-colour Drawing,” as it was then called; but as water-colour Art and chemical science advanced hand in hand, such colours as these were cast aside, and better and more durable were substituted. The consequences are now apparent. Works executed in what might be termed “the *moyen âge*” of water-colour Art are now looking as brilliant and clear as they did when they were first produced.

On the other hand, oil pictures are to be found carrying evidence that the vehicle has not prevented fugitive colours from “flying,” where rich glazings have vanished, leaving an under tint sickly and impoverished; at the same time a yellow hue has come over the whole picture, caused by the discoloration of the oily vehicle employed. Thus may the use of an improper material, whether in oil or in water, entirely frustrate the original intention of the painter.

HENRY C. NEWTON.

46, Camden Road Villas.

THE MINSTRELS OF THE MIDDLE AGES.

BY THE REV. EDWARD L. CUTTS, B.A.*

It is not unlikely that the principal minstrel of every great noble exercised some kind of authority over all minstrels within his lord's jurisdiction. There are several famous instances of something of this kind on record. The earliest is that of the authority granted by Ranulph, Earl of Chester, to the Duttons over all minstrels of his jurisdiction; for the romantic origin of the grant the curious reader may see the Introductory Essay to Percy's "Reliques," or the original authorities in Dugdale's "Monasticon," and D. Powel's "History of Cambria." The ceremonies attending the exercise of this authority are thus described by Dugdale, as handed down to his time:—viz., "That at Midsummer fair there, all the minstrels of that country resorting to Chester, do attend the heir of Dutton from his lodging to St. John's Church (he being then accompanied by many gentlemen of the country), one of the minstrels walking before him in a surcoat of his arms, depicted on taffeta; the rest of his fellows proceeding two and two, and playing on their several sorts of musical instruments. And after divine service ended, gave the like attendance on him back to his lodging; where a court being

we shall have presently to ask the reader's further attention. The oldest existing document of the fraternity is a copy of laws of the time of Philip and Mary. They are similar to those by which all trade guilds were governed: their officers were an alderman and two stewards or sears (*i.e.* seers, searchers); the only items in their laws which throw much additional light upon our subject are the one already partly quoted, that they should not take "any new brother except he be minstrel to some man of honour or worship (proving that men of honour and worship still had minstrels), or waite† of some town corporate or other ancient town, or else of such honestye and conyng as shall be thought laudable and pleasant to the hearers there." And again, "no myler, shepherd, or of other occupation, or husbandman, or husbandman servant, playing upon pype or other instrument, shall sue any wedding, or other thing that pertaineth to the said science, except in his own parish." We may here digress for a moment to say that the shepherds, throughout the middle ages, seem to have been as musical as the swains of Theocritus or Virgil; in the MS. illumina-

kept by his (Mr. Dutton's) steward, and all the minstrels formally called, certain orders and laws are usually made for the better government of that society, with penalties on those that transgress." This court, we have seen, was exempted from the jurisdiction of the King of the minstrels by Edward IV., as it was also from the operation of all Acts of Parliament on the subject down to so late a period as the seventeenth year of George II., the last of them. In the fourth year of King Richard II., John* of Gaunt created a court of minstrels at Tutbury, in Staffordshire, similar to that at Chester; in the charter (which is quoted in Dr. Plott's "History of Staffordshire," p. 436) he gives them a King of the Minstrels and four officers, with a legal authority over the men of their craft in the five adjoining counties of Stafford, Derby, Notts, Leicester, and Warwick. The form of election, as it existed at a comparatively late period, is fully detailed by Dr. Plott.

Another of these guilds was the ancient company or fraternity of minstrels in Beverley, of which an account is given in Poulson's "Beverlac" (p. 302). When the fraternity originated we do not know; but they were of some consideration and wealth in the reign of Henry VI., when the Church of St. Mary's, Beverley, was built; for they gave a pillar to it, on the capital of which a band of minstrels are sculptured, of whom we here re-produce a drawing from Carter's "Ancient Painting and Sculpture," to which

tions we constantly find them represented playing upon instruments; we give a couple of goatherds from the exquisite MS. Q. B. vii. folio 83, of early fourteenth century date.

Besides the pipe and horn, the bagpipe was also a rustic instrument: there is a shepherd playing upon one in folio 112 of the same MS.: and again, in the

early fourteenth century MS. Royal Q. B. vi., on the reverse of folio 8, is a group of shepherds, one

* May we infer from the exemption of the jurisdiction of the Duttons, and not of that of the court of Tutbury and the guild of Beverley, that the jurisdiction of the King of the Minstrels over the whole realm was established after the former, and before the latter. The French minstrels were incorporated by charter, and had a king in the year 1330, forty-seven years before Tutbury. In the ordinance of Edward II., 1315, there is no allusion to such a general jurisdiction.

of whom plays a small pipe, and another the bagpipes. Chaucer (3rd Book of the "House of Fame") mentions—

"Pipes made of greene corne,
As have these little herd gromes,
That kepen beastes in the bromes."

It is curious to find that even at so late a period as the time of Queen Mary, they still officiated at weddings and other merrymakings in their villages, and even sometimes excited the jealousy of the professors of the joyous science.

One might, perhaps, have been disposed to think that the good minstrels of Beverley were only endeavouring to revive usages which had fallen into desuetude; but we find that in the time of Elizabeth the profession of minstrelsy was sufficiently universal to call for the inquiry, in the Injunctions of 1559, "Whether any minstrels, or any other persons, do use to sing any songs or ditties that be vile or unclean."

Ben Jonson gives us numerous allusions to them: *e.g.*, in the "Tale of a Tub," old Turve talks of "old Father Rosin, the chief minstrel here—chief minstrel, too, of Highgate; she has hired him, and all his two boys, for a day and a half." They were to be dressed in bays, rosemary, and ribands, to precede the bridal party across the fields to church and back, and to play at dinner. And so in "Epicoene," act iii. sc. 1:—

"Well, there be guests to meat now; how shall we do for music?" [for Morose's wedding.]

Clerimont.—The smell of the venison going thro' the street will invite one noise of fiddlers or other.

Dauphine.—I would it would call the trumpeters hither!

Clerimont.—Faith, there is hope: they have intelligence of all feasts. There's a good correspondence betwixt them and the London cooks: 'tis twenty to one but we have them.

And Dryden, so late as the time of William III., speaks of them—

"These fellows
Were once the minstrels of a country show,
Followed the prizes thro' each paltry town,
By trumpet checks and bloated faces known."

There were also female minstrels throughout the middle ages; but, as might be anticipated from their irregular wandering life, they bore an indifferent reputation. The romance of Richard Cœur de Lion says that it was a female minstrel, and, still worse, an Englishwoman, who recognised and betrayed the knight-errant king and his companions, on their return from the Holy Land, to his enemy, the "King of Almain." The passage is worth quoting, as it illustrates several of the traits of minstrel habits which we have already recorded. After Richard and his companions had dined on a goose, which they cooked for themselves at a tavern—

"When they had drunken well afain,
A ministralle eom therin,
And said, 'Gentlemen, wittily,
Will ye have any minstrelsey?'
Richard bade that she should go,
That turned him to mickle woe!
The ministralle took in mind,*
And saith, 'Ye are men unkind;
And if I may, ye shall for-think†
Ye gave neither meat nor drink.
For gentlemen should bede‡
To minstrels that abouten yede§
Of their meat, wine, and ale;
For lo! rises of ministralle!
She was English, and well true
By speech, and sight, and hide, and hue."

Stow tells that in 1316, while Edward II. was solemnising his Feast of Pentecost in his hall at Westminster, sitting royally at table, with his peers about him, there entered a woman adorned like a minstrel, sitting on a great horse, trapped as minstrels then used, who rode round about the tables showing her pastime. The reader will remember the use which Sir E. B. Lytton has made of a troop of tymbesteres in "The Last of the Barons," bringing them in at the epochs of his tale with all the dramatic effect of the Greek chorus: the description which he gives of their habits is too sadly truthful. The daughter of Herodias dancing before Herod is scornfully represented by the mediæval artists as a female minstrel performing the tumbling tricks which were part of their office. We give on the following page a representation of a female minstrel playing the tambourine, from the MS. Royal, 2 B. vii folio 182.

A question of considerable interest to artists, no less than to antiquaries, is whether the minstrels were or not distinguished by any peculiar costume or habit. Percy and his followers say that they were,

* Was offended. † Repent. ‡ Give.
§ Travel. || Praiseglory.

* Continued from p. 187.

† One of the minstrels of King Edward the Fourth's household (there were thirteen others) was called the *wayte*; it was his duty to "pipe watch." In the romance of Richard Cœur de Lion, when Richard, with his fleet, has come silently in the night under the walls of Jaffa, which was besieged on the land-side by the Saracen army:—

"They looked up to the castle,
They heard no pipe, no flagel, a
They drew em nigh to land,
If they mighten understand,
And they ne could nought espie,
Ne by no voice of ministralcie,
That quick man in the castle were."

And so they continued in uncertainty until the spring of the day, then

"A wait there came, in a kernel, b
And piped a nott in a flagel."

And when he recognised King Richard's galleys,

"Then a merrier note he blew,
And piped, 'Seigneurs or sus! or sus!
King Richard is comen to us!'"

a Flageolet. b Battlement.

and the assertion is grounded on the following evidences:—Baldulph, the Saxon, in the anecdote already related, when assuming the disguise of a minstrel, is described as shaving his head and beard, and dressing himself in the habit of that profession. Alfred and Aulaff were known at once to be minstrels. The two poor priests who were turned out of the monastery by the dissolute monks were at first mistaken for minstrels. The woman who entered Westminster Hall at King Edward the Second's Pentecost feast was adorned like a minstrel, sitting on a great horse, trapped as minstrels then used. A story is recorded in a MS. of the time of Edward III. of a young man of family, who came to a feast in a vesture called a coat-harely cut short in the German fashion,

resembling the dress of a minstrel; the oddity of it attracted the remark from an elderly knight, "Where is your fiddle, your ribble, or suchlike instrument belonging to the mynstrelle?" to which the young man replied that he had no craft in using such instruments. "Then you are much to blame," replied the old knight; "for if you appear in the garb of a minstrel it is fitting you should perform his duty." In the time of Henry VII. we read of nine ells of tawny cloth for three minstrels; and in the "History of Jack of Newbury," of "a noise (i.e. band) of musicians in townie coats, who, putting off their caps, asked if they would have music." And lastly, there is a description of the person who personated "an ancient mynstrell" in one of the pageants which were played before Queen Elizabeth at her famous visit to Kenilworth, which is curious enough to be quoted. "A person, very meet seemed he for the purpose, of a forty-five years old, apparalled partly as he would himself. His cap off; his head seemly rounded tonsterwise,* fair kembled, that with a sponge daintily dipped in a little capon's grease was finely smoothen, to make it shine like a mallard's wing. His beard smugly shaven; and yet his shirt after the new trick, with ruffs fair starched, sleeked and glistening like a paire of new shoes, marshalled in good order with a setting stick, and strut, that every ruff stood up like a wafer. A side (i.e. long) gown of Kendal Green, after the freshness of the year now, gathered at the neck with a narrow gorget, fastened afore with white clasp and keeper close up to the chin; but easily, for heat to undo when he list. Seemly begirt in a red caddis girdle: from that a pair of capped Sheffield knives hanging a' two sides. Out of his bosom drawn forth a lappel of his napkin (i.e. handkerchief) edged with a blue lace, and marked with a true love, a heart, and a D. for Damian, for he was but a bachelor yet. His gown had side (i.e. long) sleeves down to midleg, slit from the shoulder to the hand, and lined with white cotton. His doublet sleeves of black worsted: upon them a pair of payncts (perhaps points) of tawny chamlet laced along the wrist with blue threaden points, a weall towards the hand of fustian-a-napes. A pair of red neather socks. A pair of pumps on his feet, with a cross cut at the toes for corns: not new, indeed, yet cleanly blackt with soot, and shining as a shoeing horn. About his neck a red ribband suitable to his girdle. His harp in good grace dependant before him. His wrest tyed to a green lace, and hanging by; under the gorget of his gown a fair flaggon chain (pewter for) silver, as a squire-minstrel† of Middlesex that travelled the country this summer

* Which Percy supposes to mean "tonsure-wise," like priests and monks.

† Percy supposes from this expression that there were inferior orders, as yeomen-minstrels. May we not also infer that there were superior orders, as knight-minstrels,

season, unto fairs and worshipful men's houses. From this chain hung a seutcheon, with metal and colour resplendant upon his breast, of the ancient arms of Islington," to which place he is represented as belonging.

From these authorities Percy would deduce that the minstrels were tonsured and apparalled very

much after the same fashion as priests. The pictorial authorities do not bear out any such conclusion. There are abundant authorities for the belief that the dress of the minstrels was remarkable for a very unclerical sumptuousness; but in looking through the numerous ancient representations of minstrels we find no trace of the tonsure, and no peculiarity of dress: they are represented in the ordinary costume of their time; in colours blue,

eleon, like that of the Islington minstrel. In short, a careful examination of a number of illustrations in illuminated MSS. of various dates, from Saxon downwards, leaves the impression that minstrels wore the ordinary costume of their period, more or less rich in material, or fashionable in cut, according to their means and taste; and that the only distinctive mark of their profession was the instrument which each bore, or, as in the case of the Kenilworth minstrel, the tuning wrest hung by a riband to his girdle; and in the case of a household minstrel the badge of the lord whom he served.

The forms of the most usual musical instruments

of various periods may be gathered from the illustrations which have already been given. The most common are the harp, fiddle, cittern or lute, hand-organ or dulcimer, the shalm or psaltery, the

over whom was the king-minstrel? for we are told "he was but a bachelor (whose chivalric signification has no reference to matrimony) yet." We are disposed to believe that this was a real minstrel. Langham tells us that he was dressed "partly as he would himself:" probably, the only things which were not according to his wont, were that my Lord of Leicester may have given him a new coat; that he had a little more capon's grease than usual in his hair; and that he was set to sing "a solemn song, warranted for story, out of King Arthur's Acts," instead of more modern minstrel ware.

red, grey, particoloured, like other civilians; with hoods, or hats, or without either; frequently the different members of the same band of minstrels present all these differences of costume, as in the instance here given, from the title-page of the fourteenth century MS. Add., 10,293; proving that the minstrels did not affect any uniformity of costume whatever.

The household minstrels probably wore their master's badge (liveries were not used until a late period); others the badge of their guild. Thus in the Morte Arthur, Sir Dinadan makes a reproachful lay against King Arthur, and teaches it an harper, that light Elyot, and sends him to sing it before King Mark and his nobles at a great feast. The king asked, "Thou harper, how durst thou be so bold to sing this song before me?" "Sir," said Elyot, "wit you well I am a minstrell, and I must doe as I am commanded of these lords that I bear the armes of;" and in proof of the privileged character of the minstrel we find the outraged king replying, "Thou saiest well, I charge thee that thou hic thee fast out of my sight." So the squire-minstrel of Middlesex, who belonged to Islington, had a chain round his neck, with a seutcheon upon it, upon which were blazoned the arms of Islington.* And in the effigies of the Beverley minstrels, which we have given on the preceding page, we find that their costume is the ordinary costume of the period, and is not alike in all; but that each of them has a chain round his neck, to which is suspended what is probably a seut

pipe and tabor, pipes of various sizes played like clarionets, but called flutes, the double pipe, hand-bells, trumpets and horns, bagpipes, tambourine, tabret, drum, and cymbals. Of the greater number of these we have already incidentally given illustrations; of some of the others we here give illustrations, from the Royal MS., 2 B. vii. And in conclusion we give a group of musical instruments

from one of the illustrations of "Der Weise König," a work of the close of the fifteenth century.

* Heralds in the fourteenth century bore the arms of their lord on a small seutcheon fastened at the side of their girdle.

BRITISH ARTISTS: THEIR STYLE AND CHARACTER.

WITH ENGRAVED ILLUSTRATIONS.

No. XVI.—JAMES BAKER PYNE.

HEY who are familiar with English Art only as it is seen within the walls of the Royal Academy can know little or nothing of the works of one of our best landscape-painters. It is now some thirty-three years since, when a number of artists, finding that the rooms of the Academy, then in Somerset House, offered but little space for the suitable exhibition of their pictures, associated themselves together for the purpose of exhibiting their own works, in conjunction with those of other artists who might choose to unite with them; and hence arose the "Society of British Artists," whose galleries are in Suffolk Street.

Among the earliest members of this Institution, or regular contributors to its annual exhibitions, were—Haydon, Martin, Hoffman, D. Roberts, Stanfield, Creswick, Hart, Frith, Linton, &c.; but as by the rules of the Academy no artist who is a member of any other society is eligible for admission into the former, and as it is a very natural ambition to desire the honours which the Academy is entitled to bestow, the association in Suffolk Street has from time to time lost the aid of many who were its strongest supports: one, however, though not among its earliest members, has bravely clung to its fortunes, whether good or ill, and freely acknowledges that the patronage he enjoys is owing to his connection with this society, as here he has the power to place his own pictures where they may be advantageously seen. Mr. Pyne, to whom we allude, is now Vice-president of the Society of British Artists.

In the *Art-Journal* for the year 1849, when we published a series of "Portraits of British Artists," appeared one of Mr. Pyne, with a few remarks on his

life and works: we must, on the present occasion, go back to that report for whatever information it affords us.

James Baker Pyne was born at Bristol, on the 5th of December, 1800. From his earliest years a love of pictures was the ruling passion of his mind, and, as a consequence, his greatest desire was to become an artist; but his father had other views concerning him, and placed him with a solicitor, in whose office he was employed till his twenty-first year. At the expiration of his term, however, he bade farewell to deeds and parchments, and assiduously set to work to acquire a knowledge of painting. Several years were thus passed in Bristol, in practising his Art, teaching it to others, and in studying and repairing old pictures. In 1835 he came up to London, where he remained a whole year without attempting to exhibit or sell a picture; but in 1836 he sent to the Royal Academy, "Windsor Castle, from the Thames—Morning," and to the Society of British Artists, a "View of Clifton;" the latter picture was, we believe, bought by the late Mr. Carpenter, the eminent bookseller of Old Bond Street, father of Mr. W. H. Carpenter, author of the "Life of Vandyck," and Keeper of the Print Room in the British Museum. Mr. Carpenter senior was a man whose taste and judgment in Art-matters is unquestionable; Mr. Pyne had received an introduction to him, and there is little doubt he at once saw in the works of the painter evidences of talent of a superior order. He immediately became his patron, bought his first picture, and, as the artist told us some years back, "He gave me excellent advice—cautioned me against money-lenders, and told me to apply to him in any emergency. He never bought a painting of me at a low price when I went to him for pecuniary assistance, but always freely lent me what I wanted, and received it again at my own convenience. I speak of my obligation to Mr. Carpenter with much pleasure—it is his due." We believe that this gentleman was also the first to recognise the merits of another distinguished artist, R. P. Bonington, and to foster his genius; at least, we are certain he aided most effectively in making it known to the British public, through the series of prints from his works which were published in Bond Street. We have heard Pyne speak in most commendable terms of Mr. Rought, the picture-dealer, in Regent Street, as of "a gentleman and friend to whose fine taste, integrity, and enterprise," he has been indebted for more than half the success he has met with since his residence in London.

[J and G. P. Nicholls

In the years 1837-38-39 respectively, Pyne exhibited at the Royal Academy, "Clifton, from the Avon," "Nightingale Valley, Clifton," and "Eton College;" and in 1841, "Hostel at Upnor Castle, on the Medway," and "Sandwich, on the Kentish Coast." From this period we find his name no longer on the list of exhibitors at the Academy. His subsequent pictures were to be found at the British Institution, and at the Suffolk Street Society, of which he had now become a member. Almost from the outset of his career he had aimed at the representation of open expansive landscape, where distance demands light and atmosphere, and of lake scenery, where the same qualities of painting are required, united with powerful effects of chiaro-oscuro. We scarcely ever remember to have seen a picture by him of any close subject—shady lanes, entrances to woods, deep glens, &c. We should be inclined to apply the word "clearness" as the principal quality characterising his works, and which is only to be obtained by, or rather is the combined result of—to use his own words—

"aerial perspective, a frequent alternation of the transparent, semi-transparent, and opaque media; distinct detail, and bold chiaro-oscuro. . . . Impalpable in itself, it should pervade every part while destroying all idea of the surface of a work; and so absorbing, when attained, is the full sense of its influence, that the minor and precise beauties of the finished schools vanish, and become dry and opaque when brought in contact with the pure effulgence of this vital quality. Pictures without it have an unpleasant and opaque palpableness, and seem really to form part of the useless furniture of a room; while those which possess it in any extraordinary degree, present for the refreshment of the eye so many delicious apertures of more than mimic light and air and softness, which glow without heating, and shine without dazzling, and, like the face of health, and youth, and beauty, shed a warmth around them whose brilliancy neglect cannot entirely deface; while all the varnish amendments of the picture-dealer, added to all the wash-leather rubbings of all the curators of public and private col-

lections in existence, must still leave those which have it not, as at first—dry, lifeless, and repulsive.”* In this passage we seem to discover an index to the style of painting adopted by this artist, or, more correctly speaking, to its character.

In 1839 he exhibited at the British Institution the first, so far as our recollection serves, of those “Lake pictures” with which his name in subsequent years has been so frequently identified: it was a view of “Rydall Water, Westmoreland,” and treated in a manner to illustrate the lines—

“On throne of cloud, with pure and silvery ray,
The young moon steals upon the lingering day.”

To Suffolk Street he sent the same year a “View from the Cheddar Hills—Bridgewater Bay in the distance.” In this work we recognised the dawning, as it were, of those effects of light and sunshine which have ever been regarded as the great charm of his works. Windsor and its vicinity had, from the artist’s arrival in London, been a favourite place of study with him. In the summer of this year there was published a series of sketches, executed by him in lithography, of views of “Windsor, with the surrounding Scenery, the Parks, the Thames, and Eton College”—a volume of great pictorial interest, the subjects all well selected, and most carefully and truthfully represented. His solitary contribution to the Suffolk Street Gallery in 1840—another “View from the Cheddar Hills”—forced from us the following remarks:—“It is one of the

most perfect works in the collection; the mode in which this artist manages to preserve distance is absolutely wonderful. The eye traces miles upon miles; and while every hedgerow seems distinctly marked, there is no appearance of anything like artifice, nor the remotest approach to stiffness or formality.” There were two pictures exhibited by Pyne in 1843, which to this day have not passed away from our recollection: one, a distant view of “Shakspeare’s Cliff,” hung at the British Institution, in which the cliff appears rising from a bank of mist; the sun is low in the horizon, its brightness softened down by the hazy atmosphere, producing an effect of exquisite tenderness and beauty. In the other, exhibited at Suffolk Street, London, as seen from Greenwich Park on a warm summer’s afternoon, is presented. The vast extent of the metropolis, the river, and all the distant objects, are dimly apparent through a thick veil of smoke, suffused with the hot colouring of the sunshine. We have often stood upon the spot from which this view was sketched, observing the effects described by the artist, and can testify to their absolute truth.

We have notes of four pictures from his pencil exhibited at Suffolk Street in 1844:—“In the Basse Ville, Calais,” a subject scarcely worthy of his talent, but interesting, not less from its novelty than for his judicious treatment of it; “Upnor Castle, on the Medway,” in which the river and the misty distance are rendered in his happiest manner; “Scarborough, from the South Sands,” a sunset scene, painted with a perfect harmony and richness of colour, and sug-

THE VILLA D'ESTE, NEAR TIVOLI.

[J. and G. P. Nicholls

gesting an idea of absolute repose; and “Recollections of the Floating Harbour at Bristol,” also an evening scene, luminous to a degree. In 1845 we find him exhibiting in the same gallery “Sand-gatherers, Yorkshire Coast,” a small picture, remarkable for its brilliancy, breadth, atmosphere, and sweetness of colouring; “The Vale of Neath, Glamorganshire,” the largest picture, we believe, he had painted up to that time. Perhaps in the whole of North Wales there is not a more picturesque locality than this; and in its character one peculiarly adapted for the display of this painter’s peculiar style. The manner in which he has arranged his light and shade throughout the picture shows the most consummate skill, and knowledge of the true principles of chiaroscuro. “A Daughter of the Emerald Isle,” as its name indicates, is a figure subject, and was a novelty from the hand of the artist, but a successful study. “Sunshine after a Storm,” another figure subject, small, in which a blind man is led by a dog; “Staithes—Fishing Town on the Yorkshire Coast,” a theme of very ordinary interest, but under the glow of Pyne’s sunshine made beautiful; “Hastings’ Beach,” and “Vale of the Taff, North Wales,” both of them pictures that would grace any collection.

* “Nomenclature of Pictorial Art,” Part II. By J. B. Pyne. *Art-Journal*, September, 1843.

In 1846 Pyne set out on his first pilgrimage to Italy; but before starting he sent to the British Institution one of the finest landscapes he had as yet exhibited—a view of “Snowdon,” the grand old mountain literally enveloped in a garb of dazzling sunlight, but without any exaggeration of truth. Nothing that we have seen from the pencil of this artist carries out more satisfactorily his own principles of Art, which we believe to be true principles, than does this glorious picture. To the gallery at Suffolk Street he sent also this year—“The Floating Harbour at Bristol, with St. Mary Redcliffe Church restored;” another view of the “Floating Harbour;” “Grist and Fulling Mills on the Machno, Denbighshire,” one of the few close scenes painted by him; the precipitous watercourse, and the whole of the hard, rugged, natural materials which make up the composition, are admirably represented. But his principal picture in the rooms was “The Menai Straits,” seen from an elevated point, below which the landscape spreads out into a vast expanse of country of infinite diversity of character. This is treated by the artist in his most felicitous manner; air and light seem to have been the pervading influences of his mind while working on the canvas, and they are forcibly presented over the beautiful scenery that meets the eye of the spectator.

Mr. Pyne’s first visit to Italy was made for the express purpose of study in the snow-country—that is, in the neighbourhood of the Alps—to satisfy his

mind on the subject of the variously described phenomena attending the Alpine regions under the effects of snow, modified by various degrees of coloured light from mid-day to twilight. The Bernese Alps, and those visible from the Northern Lake district, principally furnished him with such experiences. The result of his observations confirmed him in a pre-conceived opinion—that artists have been much misled by those writers who have stated that these phenomena, though always represented as exceedingly beautiful, are unaccountable. He asserts they are by no means so, except to persons altogether unacquainted with the most ordinary laws of Light and Colour, with their reflection, and that they obey a law in every way certain and sequential. We would take the liberty of suggesting to him a paper on this subject for our Journal: it would be of value to our artist-readers, many of whom, we know, have derived much instruction from his contributions to our pages.

He returned to England in time to "put in an appearance" at his accustomed places of exhibition, and of course his pictures presented the results of his foreign travel, though not of the "snow-crowned hills" he went out to see. He contributed to the British Institution in 1847—"On the Margin of Zurich's fair Waters"—Market Boats with Saints' Sails," a luminous and brilliant work; and to Suffolk Street—"The Neckar, at Heidelberg;" "Lago di Garda;" and another view of a favourite spot, frequently painted—"The Floating Harbour at Bristol." In the "Heidelberg" picture the spectator has a kind of bird's-eye

view of the town, beyond which flows the river, till it is lost in a distance of misty light, painted in a manner we can only designate as "delicious," so soft and tender is the atmospheric effect. The "Harbour" picture is a triumph of sunlight painting. In this year the artist received a commission from Mr. Agnew, of Manchester, to paint a series of twenty-four views of the English lakes, and their immediate vicinity, for the purpose of being lithographed on a large scale, and published. This work has made its appearance at intervals within the last two or three years, and has been included within our "Reviews" as the parts reached us. It is a beautiful pictorial exposition of our picturesque lake country.

Pyne sent to the British Institution in 1848 two pictures—"Staithes, Yorkshire Coast," and "Night at Merthyr, South Wales," the latter representing the effects produced over the landscape after dark by the Welsh Iron Works; and to the Society of British Artists—"Pallanza, on the Lago Maggiore;" "Mill at Plassyant, North Wales," a dark picture, differing materially from the majority of his works, yet distinguished by originality and truth of treatment; a "View of the Dogana, Venice, on a Saint's Day," a picture so full of light as to be almost shadowless, and yet most effective; and "Caernarvon," in which the appearance of a rising storm is finely represented. His exhibited pictures of 1849 were only to be seen in the last-named gallery: they were—"The Wreck Ashore," a small painting; and "Oberwesel, on the Rhine," in

Engraved by]

THE SCREES AT WASTWATER, CUMBERLAND.

[J. and G. F. Nicholls.

which the artist has adopted a low tone of colour very unusual with him, but nevertheless applied with the nicest discrimination, and with the most pleasing results. Among his works contributed to Suffolk Street in the following year were—a view of "Ehrenbreitstein," painted, we believe, from the sketch from which our print is taken, with some slight alterations; "Thames Recollections;" and another "Wreck Ashore;" and to the same gallery, in 1851—"Landing Herrings on the Yorkshire Coast," a work in which light, air, and space, were never more skilfully idealised. In 1852 we remember to have seen in Suffolk Street two pictures painted from his "Lake Sketches"—"The Head of the Wastwater, with Scawfell and Scawfell Pike," under the effects of a storm; and "The Screes at Wastwater," of which we shall have to speak presently.

In 1851, Pyne started a second time for a tour in the south of Europe, having received another commission from Mr. Agnew to execute a series of pictures—commencing with the Rhine, and extending to the furthestmost part of Italy. He returned, after an absence of three years, with an extraordinary mass of sketches, in the production of which he acknowledges to have received most valuable aid, with regard to details, from his friend and *compagnon de voyage*, Mr. W. Evans, of the Water-Colour Society, and with a very considerable number of large finished drawings, all of them painted on the spot. We

had the gratification of passing an evening in his studio a short time since, looking over the portfolios containing these drawings, as varied in subject and treatment as they are numerous. Those only who have been through Italy to study the characteristics of its scenery can form any idea of the extraordinary labour and perseverance, to say nothing of talent, required to produce such an accumulation of subject matter. For nine months of the year study out of doors is considered at least injudicious, and frequently dangerous, independently of the annoyances and discomforts to which every traveller is exposed who does not journey as "*Milord Anglais*." One has only to see this series of drawings to be satisfied they must have been made under circumstances of much difficulty, and by a man whose constitution was proof against peculiarities of climate and atmosphere. To attempt anything approaching to a detailed description of them would occupy the entire space we have given to this notice, and would still leave us much to say. There are towns and cities, mountains and valleys, rivers, lakes, and sea-coast, represented at all hours of the day, and under every variation of weather—clear and bright with the freshness of morning, parched with the noontide heat, blazing with the crimson hues of sunset, dark with the shadows of the thunder-cloud. Highly as we have always estimated the talents of the artist, they have risen immeasurably in our opinion after seeing these charming works. We hope he will be prevailed on to exhibit

them publicly: we are quite sure they will be as much appreciated by others as they are by ourselves.

There was a picture exhibited by Pyne at Suffolk Street, in 1853, which we presume was made from one of the sketches taken on his first visit to Italy; it had no title in the catalogue, but the subject was a passage of Alpine scenery under an effect of sunlight: in treatment it was eminently successful in the quality of light. His two contributions to the same gallery in the following year were also of foreign scenery: one a "View of Berne, Switzerland;" the other entitled only a "View in Italy." Of his last year's picture, also in the Suffolk Street gallery—"Evening at Chelsea," we shall only repeat the remarks it suggested to us at the time:—"We had expected to have saluted this painter on the Rialto at Venice, or to have picked him up somewhere in Sicily; but lo! we find him painting Chelsea Church, and writing "mixed teas" on the thresholds of the Chelsea grocers. The sunny glow of this admirable picture is felt over the whole of this end of the room. It has no exaggerated colour, yet it is powerful in that quality by a treatment which raises all the warm and cool greys into colour at once rich and harmonious. It is, in short, a production embodying the rarest qualities of Art."

The four subjects we have selected as examples of this painter's style of composition and treatment include views of English and Italian scenery, and are chosen chiefly on account of their diversity. The view in Venice, introducing the "CHURCH OF ST. GEORGIO MAGGIORE," is a simple, well-arranged compo-

sition, in which the purity of an Italian atmosphere is admirably exemplified. "THE VILLA D'ESTE, NEAR TIVOLI," sketched from the gardens, is represented under the effects of morning; it is painted with great tenderness, but the picture acquires force from the group of dark trees rising up almost in its centre. "THE SCREES AT WASTWATER, CUMBERLAND," is a passage of lake scenery, which in itself offers little to charm the eye as a picture, yet the artist has made it one of great interest by the broad play of transitory light he has thrown over the side of the mountain. "EHNENBREITSTEIN," is gilded with the red rays of the setting sun:—

"The moon is up, and yet it is not night;
Sunset divides the sky with her."

in strong opposition to the brilliant lines on rock and castle is the deep, rich colouring of the objects in the foreground. The great charm of this picture is perfect repose; its intense heat would seem to render exertion impossible.

With the exception of Turner, no painter of our school has so thoroughly mastered the difficulties of aerial perspective and atmospheric phenomena as Pyne; without detecting the least approximation to the copying of that great artist, his pictures very often remind us of those by Turner. He never aims at the same extraordinary, and often apparently unnatural, effects; he does not exhibit such a redundancy of poetical imagination in his compositions, such a profusion of what may be called the "flowers of painting;" and yet his mind is amply stored with visions of the true and the beautiful, gathered from a close and attentive

[J. and G. P. Nicholls.

study of Nature in her most attractive aspects, and these he transfers to his canvas with a bold and unfaltering pencil, that shows his mastery over his materials, as well as a perfect knowledge of their individual and relative value: while to this freedom of execution are superadded great delicacy and attention to form and detail. We have frequently heard similar objections taken to his colouring, as have been made to Turner's—especially in the too abundant use of white; but such objections can only come from those who have not closely analysed the colouring of Nature. We were one day discussing this very question with an acquaintance by the sea-shore on a bright summer morning. Directing his attention to the tranquil surface of the ocean, then brightly reflecting the sun's rays, we asked him its colour. "White," he replied, after looking at it for a few moments; "yes; white, from the horizon almost to our feet, gradually harmonising into a tender blue as far as the eye reaches left and right."—"Are Turner and Pyne wrong, then?" we again asked.—"No; right—there cannot be two opinions on the matter."

It is this inability to see things as they are in Nature which produces so much false and unsound judgment among the frequenters of our Art-exhibitions: they have not yet learned the "art of seeing," and are therefore incapable of pronouncing a verdict upon truths. It is only when they have acquired this power that they are in a position to form something like a just opinion of the relative merits of artists; "for, although with respect to the feeling and passion

of pictures, it is often as impossible to criticise as to appreciate, except to such as are in some degree equal in powers of mind, and in some respects the same in modes of mind, with those whose works they judge; yet with respect to the representation of facts, it is possible for all, by attention, to form a right judgment of the respective powers and attainments of every artist. Truth is a bar of comparison at which they all may be examined, and according to the rank they take in this examination will almost invariably be that which, if capable of appreciating them in every respect, we should be just in assigning them."

But a word, before we close, respecting the writings of Mr. Pyne; for, unlike too many of our painters, he is desirous, and has the ability, to impart to others the knowledge he has himself acquired. The series of papers—"The Nomenclature of Pictorial Art"—commenced in the *Art-Journal* some years since, and, after a considerable lapse of time, continued during the last year and the present, contains a very large amount of theoretical information, most valuable to every amateur and artist; and his "Letters on Landscape," which appeared also in our publication in the years 1846-47, must take their place, if published separately, as we trust they may be some day, among the best manuals of instruction which can be placed in the hands of the young landscape-painter.

THE DUTCH GENRE-PAINTERS.

BY F. W. FAIRHOLT, F.S.A.

WITH ILLUSTRATIONS FROM ORIGINAL SKETCHES
BY THE AUTHOR.

THE Hollander, as represented by his own native artists, is as distinct from the rest of the *genus homo* as the style adopted by the hands which have immortalised his peculiarities. He is known everywhere—by the rich connoisseur who glories in the possession of the original works of Ostade, Gerard Dow, Brauwer, or Jan Steen; and by the poorer lover of Art, in the many copies produced by the facile hand of the engraver. The entire truth of these pictures, and their quaint originality, thus enforce full claim upon attention, even when divested of the charm of Colour. Well, then, may the wealthy collector of taste rejoice in the possession of genuine works so remarkable for both qualities, as are the pictures by the painters of the Netherlands. With them originated that peculiar choice of subject from ordinary life which has received the *soubriquet* of *genre-painting*, from the impossibility of classing it with the grander imaginings of the Italian school. Art was in that school principally devoted to the sacred service of the Church, or the dignified realisation of historic scenes; it therefore always possessed a certain elevated dignity when it approached ordinary life in portraiture: but in no instance did it free itself from conventional or scholastic education, and give itself up to the delineation of everyday life with the zest of an Ostade, who would bestow all the graces of Art on an old woman threading her needle; or with the dashing joviality of Jan Steen, who would revel in a tavern scene with greater gusto than had ever been seen before in the history of imitative Art. Their success as a school produced a revolution in the general canons of criticism, and the ability displayed in their works asserted a position for a new body of painters then struggling into notoriety, who, discarding the *grandiose* (by this time become a little absurd from the scholastic tendencies of its devotees, who too frequently indulged in mixing the real and the fanciful,—the present world with the past, history and mythology in unreal conjunction), placed their starting point in Nature alone; making her works the limit of their studies, and bringing only the graces of Art to the proper adornment of what she placed before them—believing no created thing unworthy their earnest attention, and no attention ill-bestowed that could present it to their fellow-men surrounded by all the artistic graces consistent knowledge could bring to bear on its delineation.

This term, *genre*, was applied somewhat scornfully by the French critics, in the days of the *Grande Monarchie*, to designate a school of Art they could not comprehend, and which they chose to consider as out of the pale of Art-proper, or rather the Art of Versailles. Louis XIV. would never admit a Dutch picture into his galleries, which were, however, open to the travesties of scripture subjects his native artists painted with so much complacency, as well as to the theatrical flutterings of Bernini's sculpture. The *grandiose* trifling, which then passed for dignity, and the constrained manners which made up an etiquette as wearisome as if it were Chinese, gave no scope for the minds nurtured in formal conventionalities to understand the charm of simplicity or Nature. The lowest grade of a true Art takes higher stand than the Art produced in the hotbeds of the French court, nurtured under unnatural auspices: its despised products have passed away like all other "whims of a day," but the greater works of the honest Dutchmen remain.

Though Ostade is inseparable from Dutch Art, and by his genius was the earliest to raise it to renown, he was not a native of the country. He was born at Lubeck, in Germany, in 1610. Hence some biographers unhesitatingly place him among German artists; but he was unquestionably German only by the accident of birth—for abandoning his native country early in life, the formation of his mind and the knowledge of Art he possessed were essentially Dutch. Like many a foreigner undergoing the change of thought and habit produced by a residence among strangers, he became ultimately more national than the native born; and earnestly

devoted his ability to the delineation of the people of his choice with a zest and power hitherto unknown. Holland did not in his time want for wealthy amateurs, and, although the long life of Ostade was spent amid political turmoil, the country was improving in wealth and importance beneath the rule of great public men. It is to Frank Hals, of Haarlem, that he was indebted for the knowledge he obtained of the mere manipulation of Art. Frank was a free, dashing painter, but a perfect tradesman in his profession. He had considerable tact in producing saleable pictures, and also in discovering young and needy men of genius who would aid him in multiplying them quickly. His wife, as avaricious as himself, fostered the trading spirit, and between them they made the studio a mere shop, and the pupils mere mechanics. At the time Ostade was in this state of servitude he had as a fellow-pupil Adrian Branwer, with whom Hals had accidentally become acquainted, and whose ability he had detected in the humblest employ. His mother was a poor milliner at Haarlem, and he used to sketch on paper for her the flowers and other ornaments with which she embroidered the caps and collars of

her customers. The ability shown by the boy in designing these decorations induced Hals to examine his sketches, and ask if he would like to be a painter. The boy readily replied in the affirmative: his mother was consulted on the subject, but she would agree only on condition that Hals should entirely provide for him during his pupilage. He consented; but, with wretched parsimony, when he found the lad's ability, locked him in a wretched garret, and made him labour continuously with hardly sufficient food, without money, and without relaxation. His fellow-students, however, behaved more mercifully by him, and commissioned him to make them sketches for a few pence each in such few moments as he could snatch for that purpose. His master discovered this, and punished the poor lad by making him work harder on still less food, until, persecuted more than nature could bear, he broke from his prison and escaped. With the childish experiences of a boy, he made provision for the first day of his liberty by purchasing as much gingerbread as he could carry in his pockets; and then ensconcing himself beneath the carved ease of the famous great organ in the principal church of

HALL OF AN OLD HOUSE, LEYDEN.

the town, leisurely enjoyed this delicacy. After a few hours his situation became irksome; he was lonelier than in Hals' studio, for his artistic implements were wanting; hunger, too, outmatched his gingerbread, and he ventured forth ruefully to the church porch. Here he was recognised by a passer-by, who had known him in his master's house; from the poor boy he learned his melancholy story, and at once offered to be the mediator between them—succeeding so well that Hals behaved better to him; for he was anxious to profit by his genius, and had sold many of his works at high prices, as the production of a foreign artist of great merit.

It was at this time that Ostade came into Hals' studio as a pupil, and fully appreciating Brauwer's ability, and indignant at the manner in which he was treated, urged him to try his fortune on his own account, and escape to Amsterdam, which was then full of connoisseurs. Brauwer took his advice, and luckily went on his arrival to an inn kept by one Van Sommeran, who had been a painter in early life, and whose son still practised the Art. Here he was well received, and his talent appreciated. It was soon discovered by an amateur, to whom his first picture was shown, that he was the "foreign

artist" whose works Hals had sold so highly. He was well-paid for his work, and became, from the depth of poverty and privation, free and comparatively rich. It is little to be wondered at that he revelled in the change. He gave himself up to tavern life, painted sottish scenes, and the rude brawls they engendered, and spent his money among the drunken boozers he painted—caring little to work before it became absolutely necessary to obtain money for his creditors.

Ostade, possessed of true German phlegm, went on a steadier course. Disgusted with his master, he quietly abandoned him, but settled down beside him in the city of Haarlem to honestly obtain patronage for his own talents. He tried them in various ways; but being a young and inexperienced man, he fledged his wings in imitative Art, and endeavoured to rival the works of Rembrandt and Teniers. He did not succeed; yet he did not fully feel his own power of originality until his old fellow-pupil Brauwer paid him a friendly visit, and urged him to throw away conventionalities, and depend on the strength of his own genius. The hearty advice of the grateful young painter, to whom he had once tendered advice as useful, determined his course,

and he struck out a style which has invested his pictures with a charm all his own.

Unlike Brauwer, Ostade was a quiet, industrious man. He married the daughter of Van Goyen, the marine-painter, and a large family was the result of the union, for whose support he laboured incessantly until the necessity for improving his monetary affairs induced him to make a change, and he decided on returning to his native town to settle there; but he got no further on his road than Amsterdam, where he found so much patronage, that about the year 1662 he settled there, making the neighbouring villages the scenes of his study; and, with the characteristic quietude of his life, having found out his *forte*, a fair field for study, and a due amount of patronage, he never left Amsterdam; and died among his patrons in 1685, at the ripe age of seventy-five.

In his pictures we see the best transcript of Dutch life in that era: the happier and better class of subject was chosen for his delineation. The tavern brawls, the drunken orgy, or the coarse village fête, had no charms for his pencil; but the rustic at home amid his family, or enjoying himself with his pipe, or listening over the trellis-hung door of his cottage to the travelling minstrel's simple hurdy-gurdy, often employed his pencil. He never caricatures their simple life; and, while displaying it in the most complete homeliness of its character, never offends by want of taste, however low the grade of the persons he may represent. Poor though they may be, they are seldom repulsive, as in many of the works of the artists of the Low Countries; while the heartiness of their joy as they look on their children, or revel in the simple pleasures they can obtain, gives them an interest and a claim on attention that pure honesty always may command. They show how much poetry there is in common things, and how much lurks beneath

"The short and simple annals of the poor."

The life of Brauwer possesses great stirring interest; indeed, it may be said to be the most eventful career led by any Dutch painter. They generally passed through their course of life so quietly and simply, so industriously and prosperously, that we know little more of them than that they lived, painted, and died. The adventurous spirit of Brauwer, and the erratic nature of his tastes, led him into a more chequered path. Cradled in poverty, a slave to a bad master, as he emerged to manhood he ran a reckless course when liberty and money came into his possession. He must have been occasionally taken for a madman by his stolid countrymen. Many are the quaint stories told of the painter—his recklessness and his buffooneries, which must have frequently set the tavern in a roar. He had much caustic humour also; and it is narrated of him, that being invited to a wedding, and feeling it was only because he had discarded the slatternly clothes he usually wore, and donned a suit of velvet, he soaked his new coat in the richest sauces on the table, declaring that the good cheer could only be properly bestowed on the thing invited; and then casting it on the fire, he coolly walked back to his old tavern companions. Immersed in his studies of low life, and enjoying only such scenes as he loved to paint, he never sought to amass money; and it is recorded of him, that on one occasion, when a considerable sum was paid him, he abandoned his pencil and home for nine days, until he had spent it all, returning penniless, and praising heaven that he had at last got rid of it.

This reckless life naturally produced the usual bad results, even to a man of so few wants as Brauwer. His debts accumulated, and at last were so portentous that he saw no escape from his liabilities but flight. He left Amsterdam, and hurried to Antwerp; but when he reached that city he was at once arrested by the soldiery, for the thoughtless painter had no passport, and the Hollanders were waging fierce war against the Spaniards, who claimed to be their governors, and in whose hands Antwerp was held. He was at once marched to the citadel* as a Dutch spy, and in it encountered the

Duke d'Arenberg, who was imprisoned there by order of the Spanish king, and whom the painter imagined to be the governor of the fortress. In profound tribulation Brauwer told his simple tale, and assured him he was only a poor painter. To test his story, the duke good-naturedly sent a messenger to Rubens, then residing close by, and obtained from him canvas and colours for Brauwer, who at once set to work, and painted a group of soldiers who were engaged beneath his prison window in a game of cards. When it was finished it was shown to

Rubens, who at once declared it to be a work of Brauwer's. That really great and generous man went immediately to the governor, begged for the liberty of his fellow-artist, and ultimately obtained it on becoming personally answerable for his conduct. He did not rest here; but took Brauwer to his own princely mansion in Antwerp, where he gave him a chamber for his exclusive use, clothed him anew, and assigned him a place at his table.

Fortune now seemed to have done her best for Brauwer, but he was not the man to value her smiles.

THE CITADEL OF ANTWERP IN 1603.

His short residence in the house of the courtly Rubens, who lived more like a prince than a painter, instead of elevating only depressed a man whose chief joy centred in tavern life. Like old Walter Mapes, his aspiration was—

"In a tavern to be till the day of his death,
With no stint to the full-flowing bowl,
That angels might slay, as he drew his last breath,
'Rest and peace be to this thirsty soul.'"

He made a precipitate retreat from Rubens's house

to the beershops, selling his clothes for drink. Becoming acquainted with a boon-companion, one Joseph van Crasbeeck, a baker, he took the offer he gave the painter to board and lodge him on condition that he gave him lessons in Art. Master and pupil were as constantly carousing as painting, until at last all things went so ill with them that flight again was necessary, and both started for Paris. Brauwer, however, found the life of the Parisian unlike the beer-drinking of Belgium and Holland, and longed

GATE AT HAARLEM.

to return. But he got no further on his road back than Antwerp, where he arrived, suffering from

of Alva might overawe the men of Antwerp. It was subsequently greatly strengthened by General Carnot.

* Walter Mapes flourished in the twelfth century as Archdeacon of Oxford. This thirsty churchman thus expressed himself in the first stanza of his celebrated convivial song, with a strength above our translation:—

"Mibi est propositum in taberna mori,
Vinum sit appositum morientis ori,
Ut dicunt, cum venerint angelorum chori,
'Deus sit propitius huic potatori.'"

disease, exhaustion, and neglect. As a pauper he was received in the old public hospital of the city, and there died wretchedly, in the year 1660.* His body, wrapped in the straw pallet upon which he died, was inhumed in the burial-ground devoted to the plague-stricken; but his old friend Rubens,

* The public hospital of Antwerp is appropriately named after St. Julian, that saint being the patron of travellers. It is still a large and useful establishment, but preserves no traces of its antique features except the old Gothic doorway engraved on the following page.

* Our engraving exhibits the aspect of the citadel of Antwerp at the time when the painter was prisoner there; it is now a much stronger position. In his time it was fed by a canal connected with the Scheldt, and the ramparts economically served the purpose of foundations for windmills to grind the corn of the garrison. The necessary houses for troops are arranged with Dutch formality; a chapel is also contained within its bounds, and an open space for the exercise of the soldiery. It was constructed by the celebrated engineer Pacciotti, that the cruel Duke

hearing of this, and much moved at the untimely end of so true a genius and so great an artist, had him re-buried at his own cost, with all honour, in one of the principal churches of the city, and determined to erect a monument to his memory. He perfected his design, but was himself numbered among the dead ere he could have it executed.

In Gerard Dow we find the quietude of an Ostade. Throughout a long life he resided at Leyden, and devoted his whole thought to his Art. Painstaking in a most extraordinary degree, he laboured unremittingly on his pictures; and Sandraat, in recording a visit he paid him in company with Bamboccio, narrates that Dow declared he should bestow three days more in finishing a broom in one corner of the picture, which had already attracted the attention of both by its laborious manipulation. In all his works he indulged the same love of minute finish; and he was as careful of the colours he used, grinding them himself, and treading his studio on tiptoe, lest he should raise dust on his palette to injure their brilliancy. The richness and purity of his colouring is still unrivalled; and though with some painters such extreme love of minute finish might sink their works to tameness, those of Dow have a vigour and an expression never excelled by any artist of his age. His pictures of Dutch life are perfect. The "Village School," in the Museum of Amsterdam, is often quoted for its peculiar power, and the difficulty the artist created for himself only to conquer it. It represents a large room filled with figures, and lighted by four candles at different parts of the composition. But a finer, if not the finest work by Dow, is the picture in the Louvre, known as "La Femme Hydropique," which displays his wonderful colour, drawing, composition, and knowledge of effect, in the most satisfactory manner.

In Gerard Dow's works we view the superior life of the Dutch. He has no love for the delineation of vulgar or coarse scenes, such as delighted too many of his contemporaries, and gave too much weight to critical objections to their works in general. Refined minds, used to the purities and high resolves of the Italian schools, received a repulsive shock from the scenes of Brauwer and Jan Steen, and could scarcely tolerate the simple truth of Teniers, or the grand imaginings of Rubens, accompanied by the coarsenesses which seemed almost inseparable from the governing ideas of these masters. Ostade, on the contrary, elevates all he touches; his youthful figures breathe health and win affection; his men and women are not the tanned and wrinkled creatures repulsive to eye and mind; but rather lovable from the deeply-traced furrows with which sixty winters of genial thought have seamed their faces—"frosty" the end of their life scarcely seems, it is so "kindly" withal; and if we would pleasantly dream over the old time in Holland, and live in imagination among the people of the seventeenth century, we must go to the works of Ostade and Dow.

It is by studying the paintings of Jan Steen we become most intimately acquainted with the everyday life of the Dutch. Like our own Hogarth, he had the keenest sense of humour; and, like him, he has been too frequently stigmatised as a slovenly painter, or as a caricaturist. Both artists handled their pencils freely enough, but they only did as much by one touch as less impressible minds could do by a dozen; while their equally powerful perception of humorous character led them to fix its broadest features on their canvas. Careful execution, free conception, vivid and powerful colour, and vigorous chiaro-oscuro, are declared by Dr. Waagen to be found in the works of Jan Steen. Dr. Kugler says, "They imply a clear and cheerful view of common life, treated with a careless humour, and accompanied by great force and variety of individual expression, such as evinces the sharpest observation. He is almost the only artist of the Netherlands who has thus, with true genius, brought into full play all those elements of comedy. His technical execution suits his design; it is carefully finished, and, notwithstanding the closest attention to minute details, is as firm and correct as it is free and light." In the landscape backgrounds of some of his pictures—such as "The Game of Skittles," in Lord Ashburton's gallery—we find qualities which the greatest English landscape-painter, the late J. M. W. Turner, declared "worthy of Cuyp." Some of his scenes of better-class life—such as that known as "The Parrot," in the gallery at Amsterdam—are full of

grace and careful manipulation. It is, however, chiefly by such pictures as his "Feast of St. Nicholas," in the same collection, that he is best known; here his humour and expression are so great, that a French critic says you seem to know the thoughts of each person in the picture. In Mr. Baring's gallery there is a marvellous instance of his power—an old woman looking up with a grotesque earnestness into a doctor's face, who has come to attend her daughter. The lifelike energy and vivid expression of fleeting

GATE OF ST. JULIAN'S HOSPITAL, ANTWERP.

humour in each feature are perfectly wonderful. It is at once simply and boldly painted, as if the expression had been caught by the daguerreotype.

As reckless as Brauwer, Steen lived a happier life: he was idle, gay, and thoughtless, but not vicious. Always poor, and careless of money when he had it, he rattled through life, taking its rough lessons with perfect good humour, and never caring for the morrow. He was born at Leyden, in 1636, and died there in 1689. He married early, and had

several children. His wife, like himself, was careless and equally improvident; she appears to have been quite as neglectful of all household duties and provisions for the future as her husband. If what is affirmed of some of his paintings be true, they represent her in no creditable state of ebriety, and her whole household in confusion. Unluckily they both started in life in a brewery at Delft, which was furnished for them by the artist's father, who was in that trade. The young couple, however, kept their taps constantly running for their own use and that of their friends, until bankruptcy closed the doors, and he took up Art for a fresh living. The life of a tavern-keeper had, however, too great a charm for Jan to relinquish readily, and he came back to Leyden on the death of his father, and opened house as one of that fraternity. Hither soon came all the toppers of the town, and many a careless artist to boot. Among them were Mieris and Lievens; the figure of Peace extending her olive-branch, which Jan painted for his sign, was indicative of the little trouble the painter-publican chose to give his customers. Hence the toppers never troubled themselves to pay, and Jan, faithful to his sign, gave them no uneasiness about it, until again compelled to close his too friendly doors through debt. His careless wife died soon after; and his neglected children frequently became the models for many of his pictures. He contracted a second marriage in a very humble way with a woman who sold sheep's heads and feet in the butchers' market; and he painted, and drank, and took the world easy until his death, when he left his wife with nine children, one of whom took to sculpture as a profession.

In spite of his culpable carelessness, and love of slatternly ease and tap-room life, he had superior friends. The gentlemanly Karel du Moor painted his humble second wife's portrait to gratify them both; Gabriel Metz, the quiet and elegant delineator of Dutch aristocratic life, was also his friend, and sat with his wife to Jan for their portraits; and Mieris, we have already noted, was his boon-companion. The elegance of the pictures by this latter artist, who always chose the higher life of Holland, like his fellow-artist, Metz, for the subjects of his pencil, and delineated such scenes so admirably, would scarcely have led to the conclusion that he could have found pleasure in Jan's tavern at Leyden. But the fact is that Jan was a sound artist, and could

LEYDEN.

mix up agreeable knowledge with his farcical jovialities; and the orgies of Jan's tavern proved so fascinating, that it is recorded Mieris was nearly drowned one night in a dyke as he returned home in one of what Burns calls "The wee short hours ayont the twal," rather the worse for liquor. The painter was fished out by a cobbler, who, astonished at his velvet dress and gold buttons, was still more surprised to find the saved man only a poor painter; but most astounded of all when the artist, in his gratitude,

made him a present of one of his pictures, for which he obtained 800 florins.

It is in the works of Jan Steen that we more particularly see the ordinary life of the Dutch people depicted. Their manners and customs may be there truly studied. "The Feast of St. Nicholas," at the museum at Amsterdam, and "The Marriage," in the collection of Mr. Baring, illustrate our meaning.

[To be continued.]

SUGGESTIONS OF SUBJECT TO THE STUDENT IN ART.*

BY AN OLD TRAVELLER.

CHAPTER VI.

Helen the Beautiful—Sacrifice to Diana Artemis—The Bride of Sparta—A Place of Peril—Otho the Sanguinary—Otho the Wonder—Pope John XVI.—Crescentius—"Thy Sin shall follow thee!"—The Gift of the Roman—Conrad of Franconia—The Soldier's boot—A Picture from the *Times*—The Sheik-ul-Islam—The Patriarch—The Armenian—The Rabbi—The Cranes of Ibycus—Might of the Eumenides—A Legend of the Bruce—St. Fillan the Hermit—The Luminous Hand—The King's Vision—A Frenchman to be painted—Lea Hurst—England's Angel of Mercy—The Wide-World's Florence Nightingale—English Cathedrals—Ancient Oratory of St. Martin—King Ethelbert the Christian, and Bertha the Queen—Travelling, Past and Present—The Packhorse—Peasant Girls of England—The Gay and Roving Carriers—The Flying Coach.

OF Helen the beautiful, as her bright eyes beamed over the world when the best of their light had departed, and after her downfall had deprived their gaze of its firm self-assurance, we have representations in abundance; but not so of that better period, the fair morning of her life, when as yet there had arisen no cloud to dim the radiance of her beauty—when the faultless features had contracted no expression that could mar the effect of their pure outline, their delicate texture, their soft and chastened colouring; while the perfections of her form retained all that nameless grace of motion which results from merited self-approval, and some portion of which must needs be lost with every step towards wrong. No: we have not enough of Helen as she was in that young day; and the sculptor may look to it with advantage, for it is his affair. Let him give her, for example, to our delight and admiration, as she is prepared to lead her young companions, when all are going up to sacrifice in the temple sacred to Diana Artemis. She lifts the wreath of triumph, and a moment later shall see it placed on her unsullied brow; but as yet we have the faultless contour unbroken; wherefore take now thy chisels, Sculptor—wait not till those candid brows be shadowed, though it be by congenial blossoms; let the chaplet still remain half suspended, and give us the glad sweet face of the peerless princess as she stands *now*—blameless.

For the painter there is also place—but his moment is not the same, and the subject he shall take is of different character: he will find it in certain stanzas from the *Lyrics* of Stersichorus, which do precisely the thing we have been talking of—they take the artist back, *videlicet*, to the blissful period when he may most frankly delight in the study which that all-beauteous Helen presents. The words are these:—

"Rolled the refulgent ear along,
Bearing the fair bride of the Spartan king,
Who, in her radiant beauty, like a star
Or earth-born Venns, shone afar.
And see! with dance and choral song
Myeene's dark-haired daughters bring
Their choicest gifts, and golden quinces throw
In her chaste lap—and boughs of myrtle bloom,
Odorous and white as snow—
And roses, on Eurotus' banks that blow—
And violet flowers, the earliest of the spring,
To break the winter's gloom.

"Beautiful Helen! in thy queenly pride
To thee we bow, great Menelaus' bride,
With downcast eyes and bended knee;
Sweets to the sweet—we offer these to thee." †

The painter will be at no loss for beauty of site fittingly to exhibit the lovely train called before him by the words of the poet. Softly undulating, the sun-lighted landscape lies fair beneath the rich deep blue of the Grecian heaven; cypress, vine, and olive, lend the variety of their tints; on a gentle acclivity there gleams the pure white marble of a delicate Ionian fane; and, glittering afar, is the calm unruffled surface of a boldly-curving bay, heaving slightly, but only as with the peaceful breath of a joy-fraught life; white sails, as were they sea-birds, may be discerned on the waters, but all are in the remote distance—they do not mar the Elysian tran-

quillity of the hour by any thought of sinister arrivals—those barks pursue their unheeded way, and no evil that may lour in the future is now apparent.

To him who ascends a throne in his boyhood, a great and splendid destiny may seem to be appointed, but it by no means follows that his lot is a desirable one; on the contrary, a more than common amount of evil and suffering is but too frequently the result of his position—the rule of his life. Examples of this unhappy truth crowd on the memory. The life of Otho III., Emperor of Germany, who assumed the perilous seat in question when but twelve years old, is among the most prominent—as may with almost equal truth be said of that of his father, Otho the Sanguinary, into whose hands were given the reins of sovereignty before he had well numbered eighteen springs.

Studies from the life of the first-named emperor, Otho III., namely, were made some years since, at the instance of the present writer, by a young Bavarian artist then painting in the Pinacothek of Munich. They were subsequently much admired by certain amateurs of Art at that time assembled in Venice; but the failing health of their author made it but too obvious that his work on earth must end before it had well begun, and not one of them was ever completed.

One of these sketches represents the unfortunate pontiff, John XVI.,—elevated to the chair of St. Peter, as most of you will remember, principally by the influence of the Consul Crescentius,—at that moment, when, made prisoner by Otho, he is brought forth to die the cruel death inflicted on him by command of the infuriated monarch. The scene of our picture is the summit of the Castle of St. Angelo, Rome, in all the pomp of her regal beauty, lies immediately at our feet; the seven hills are before us; and beyond lies the wide-spreading Campagna; but our interest is all centred on the melancholy group gathered within that narrow space which constitutes the topmost level of the fortress.

Otho has cased the eyes of the pontiff to be put out, and has otherwise cruelly mutilated his face; but the artist judiciously withholds the more revolting details, and we do but see that the prisoner, thus helpless in the hands of his executioner, is on the brink of doom: another moment, and those rutilant figures, two of whom are already leading the blind captive forward, will close around him; they are preparing to cast him from the battlements to the court below, and a few fleeting moments only have to pass before they shall have accomplished the cruel mandate of their lord.

The second study gives us the Consul himself, at the moment when his head is about to be laid on the block; he, too, has been condemned, as you will also remember, by Otho; and for that same revolt wherein his influence had prevailed, to the expedition of Gregory V., then pontiff, and to the substitution of the unhappy John.

The principal merit of these sketches is the correctness of drawing exhibited in the figures of the executioners, which, in both instances, give proof of more anatomical knowledge than is usually attained in the first youth of the student.

A third cartoon of the same series represents Otho himself. He is reclining on the purple couch of sovereignty, in a magnificent apartment of his palace. Implacable in his resentments, and otherwise tainted with the vices of his age, Otho was nevertheless brave and resolute, just and generous. The man here taking a short repose from the toils of a laborious life is of noble presence, and a not unpleasing aspect: the flower of his youth has scarcely departed, for the summers he has seen do but number twenty-nine; yet are the marks of care and suffering become apparent on his brow, and you would give him some ten years more, if you judged of his age by his expression. He is extending his right hand towards a woman of singular beauty and richly attired, who is in the act of presenting him with a pair of gloves: one of these he has already drawn on, and his hand is extended, as we have said, to receive the other.

And she who presents it to him?—She does so without hesitation; yet is there in her eyes a strange rigidity of gaze, and in her whole aspect a character all unsuited as it should seem to the features of one who is performing a service of affection, and might

be expected to exhibit some pleasure in her office: whereas this woman's hard compressed lips betoken the stern resolution of one determined on some desperate act, rather than the soft sweet loving glance of her who, bringing a fair gift, is gratified by the gratification she is giving.

But this is the widow of Crescentius, and the gift she offers is the death of the recipient; hence those hard eyes, fixed observingly on the face of her unconscious victim, and hence the resolved sternness of the lips.

Otho, affecting to lay the crown of Germany at her feet, has reduced the proud wife of Crescentius to the condition of his paramour; but he has refused to fulfil his promise of espousal, and the Roman is avenging her wrongs by a murder. Those gloves are poisoned, and Otho dies by the gift.

In his mode of treating the third of these subjects, our artist made a slight deviation from the truth of history, which does indeed affirm the death of Otho by means of poisoned gloves, and that these were sent him by the widow of Crescentius for the cause assigned, is also a well-authenticated fact: but we nowhere find it asserted that the gloves were presented by her own hand, nor is it, indeed, probable that this was the case. The dramatic interest of the picture is, without doubt, greatly enhanced by the mode of treatment adopted, but of this part of the subject it is not now "our hest to speak."

Another study, and from a period of German history immediately subsequent to that just treated, but not by the same painter, has been taken from the reign of Conrad II., Duke of Franconia, who succeeded Henry II., the immediate successor of our previous acquaintance, Otho III. This represents the somewhat singular spectacle of an event which certainly did take place, and, being true, we may suffer it to come in, by way of relief to the painful effect produced by the stories preceding.

Conrad of Franconia was remarkable for the generosity of his disposition—not in the narrow sense of mere liberality, and the free hand of giving only, but in the wider acceptance also: the story alluded to is related among other instances. A gentleman whose possessions were not equal to his birth and bravery, had lost a leg in the imperial service, while performing prodigies of valour in the effort to save a standard, which he brought off at the hazard of his life. Conrad, informed of the circumstances, and hearing also that the noble was poor, sent to bid him to an audience; and it is this meeting of the emperor with his mutilated subject that the painter has represented. The high officers of his court surround the monarch, and one of the most dignified of their number holds in his hands a riding-hoot, filled to overflowing with gold coins of the empire. This has been presented to the successful soldier of the standard, and the dignitary is now resigning it to the care of an old servant of the mutilated man, whose look of pride and old affection is so earnestly fixed on his master, that he scarcely seems to bestow a thought on the value of the deposit: with him,—a fine old warlike figure himself,—as with the soldier of Napoleon, "Honour is all." The story proceeds to say that Conrad, declaring his resolve to confer a liberal pension for life on the former possessor of the boot, thenceforth useless, demands the gift of his second son in return—assuring his gratified subject that the child shall henceforth be reared in the palace, and in due time be ennobled among his pages. This, too, the painter depicts. The boy, a remarkably beautiful one, is approaching from the outer hall; he is led forward by his tutor, a pale and grave-looking ecclesiastic, whose placid but highly intellectual countenance comes in strong contrast with the bright, glad, youthful aspect of the child, while his sombre robes stand in equal distinction with the gorgeous habits of the figures more immediately around the throne.

The *Times* is a great magician. This truth is so deeply felt, so universally admitted, that many voices will at once arise to say, "We knew all that before." But the *Times* is also a great painter; and if there be any yet ignorant of the fact, let him read what follows, and his education shall in so far be amended.

"The reading of the imperial firman, granting equal rights to all the subjects of the sultan, was fixed for Monday last. * * * *

"The apartment destined for the ceremony was

* Continued from p. 154.

† These lines, a fragment only, are given by Mr. Jesse, as the translation of his friend, the Rev. J. Mitford. They will be found in a much-admired work of the first-named writer, namely, the "Favourite Haunts and Rural Studies," pp. 307, 308.

the great council-hall, spacious enough in itself, but by no means sufficient to contain the numbers of people who wished to be present at this important act. * * * *

"Beside the ministers surrounding the Kaimakam of the Grand Vizier, Mohammed Kibrishi Pasha, there were present all the members of the Council of State and the Tanzimat, with all the other high functionaries of the Porte. The Sheik-ul-Islam,* the patriarchs, the archbishops and bishops of the different religious communities, with a good number of the most prominent men among the Mussulman and non-Mussulman population of Constantinople, likewise took part.

"This assembly, composed of the most distinguished men in Turkey, would have formed an interesting study for a physiognomist; nor would it have been found inferior to any similar assembly as regards intellectual countenances. The most prominent feature was earnestness. Notwithstanding the contact with Europe, and the history of so many deposed and assassinated sovereigns, the person of the latter is still held in religious veneration. Even the rather turbulently disposed crowd outside became silent when the firman, signed by the sultan's own hand, was taken out. Everybody seemed to be penetrated with the solemnity of the moment.

"The firman was read by Habat Effendi, the *Mektebji*, or Chief of the Chancery of the Grand Vizier. When the reading was over, the Sheik-ul-Islam, Arif Effendi, read a prayer appropriate to the occasion; after which the grand vizier made an address to those present, in which he touched upon the most prominent points contained in the firman.

"When the ceremony was over, printed copies of the firman, in the original Turkish, were distributed among the crowd. Translations into all the languages of the empire are in course of preparation, and when these are completed they will be distributed through the various provinces." * * *

So far the mere statement of the facts by an eyewitness; but how significant are these facts! In another part of the paper are the remarks that follow; and if the simple declaration that so grand an event has been accomplished has not inspired you at once to commence the transmission of its details to the never-dying canvas, here are certain words that cannot fail to make your heart glow, and wake up your imagination, or the one is colder and the other more torpid than befits that glorious name of Painter which you bear.

Dear friend *Times*, *loquitur*:—"If the will of an Eastern potentate be indeed supreme, and like the centurion of old, he has only to say 'Do this,' and it is done, then may we consider that the greatest revolution of any age has just been accomplished beneath our eyes. A firman of the sultan, establishing absolute equality between all his subjects, has been read before the assembled dignitaries of his empire. That empire is the dominion of Constantine and of the Caliphs in one. From the frontiers of Austria to the shores of the Persian Gulf; in Belgrade and Adrianople; in Constantinople, Jerusalem, Alexandria, and Tunis; in the holy cities of Arabia, at the birth-place, and at the grave of the Prophet, the imperial edict, translated into many tongues, will be read and pondered. Those who listened to its ordinances a fortnight since at the Porte, were the representatives of the East in its widest sense. The grand vizier of the Ottoman sultans and the Sheik-ul-Islam, clad in the green robes of his office, impersonated that conquering and ruling faith, which, even to the days of our own William III., threatened Europe and Christianity. The patriarch of Constantinople, still the successor of Chrysostom, and the head of the earthly Church to 80,000,000 of men, stood surrounded by bishops, whose sees were famous cities when France was a Roman province, and England a wilderness of scattered Celtic tribes. The metaphysical disputes of a forgotten theology were represented by the patriarch of the Armenian Church, the chief of a nation isolated in features and language from any that now lives on earth. Last of all, there was the chief Rabbi of the Jews, who came to receive for his oppressed race the promised equality in their own holy land, from the lips of a Mussulman sultan.

* Few will now require to be told that the Sheik-ul-Islam is "Chief of the Faith." He is head of the law no less than of the priesthood, and is a dignitary of the highest distinction.

Whatever be its results, the event which has just taken place must always remain one of the most interesting in the history of mankind."

It must, beyond all doubt—must and will. Think, then, if it be not well your part to prepare for the visible presentment thereof in the highest place of our noblest gallery. I say "prepare," because I know well that worthily to depict this great event will require all the energies of an earnest mind, powerful to comprehend the great and good, with all the devotion of a pure warm heart—loving that good cordially when and wheresoever it may be found, and desiring fervently that its beneficent influence may prevail. To these must be added a keen perception, quick to comprehend all the strongest points in every case and question, that no portion of the interest may be suffered to escape; an imagination capable of enhancing the force even of the most salient features, yet chastened by a delicacy recoiling sensitively from the baneful vulgarity of exaggeration; and, joined to the rest, must be that excellent servant, the cool judgment, guiding a firm well-practised hand, ever ready to obey the dictates of the master-spirit within.

All these, and much besides, are demanded by the great and lasting work before you—but then you have them all; or if you do not fully possess them at the present moment, they are increasing to you with each advancing day—you are in culture for such a condition of being, you labour earnestly to secure it, you look with reverence to the older aspirants who have attained to these qualities before you, and with sympathy towards the comrade who is treading the upward path at your side? Surely yes! but if not, if you do not feel conscious to any one of these qualities, feelings, or aspirations, begone! it is not for you that a task so exalted has been reserved; and what still remains to be added, from the words of our good friend, is for such as shall better deserve to hear it.

For these, then, is written that which follows, and which is taken in like manner from the *Times*:—"

"Historians have discussed the causes of the French revolution, and have attempted to find its origin far back in the annals of the country. They could not conceive that a single age could produce by itself so marvellous a change. But what demolition and reconstruction of society will have been so complete as this great Eastern revolution, which, beginning some twenty years since, has lately hurried onward so rapidly, and seems destined still to pursue its portentous course? To practical minds, the domestic events of our own community may have a greater importance, but they must be few who can look on what is passing in those ancient lands, the cradle of the human race, the home even now of venerable nations, without a strange and peculiar interest. That religious freedom should have been proclaimed for the first time to the followers of churches persecuted both by emperors and sultans—that material progress should be in store for regions almost forgotten by the busy enterprise of the West, are facts which must call for the attention of all, even amidst the most earnest discussion of our own affairs. It is like a vision of dry bones—dry bones called to life on the disinterment of a city hidden for ages."

There, then, is your picture. We have said that the artist who shall paint it will perform a great work, and he will do so; but is it a difficult one? To him who is fit for it, certainly not. Let him read again, and he will see that the picture is already painted to his hand; he has but to copy—that great brother of the brush, whose words we have just given, has indeed left him little else to do. Being, then, what he is, our painter will let none of that "earnestness" which, we are so significantly told, was the most striking characteristic of those assembled, escape him; but, going to his work with the consciousness of its high significance exalting and ennobling his conceptions, and with all his powers devoted to the worthy expression of its import, he will set before us the glorious event of that fortunate Monday in such sort as to make the representation, no less than the thing itself, an abounding "joy for ever."

Unexhaustible are the riches of Germany's beloved and justly boasted Schiller. No man takes from their abundance but to his profit: be your purpose

* See March 1st, 1856.

what it may, never—provided only that purpose be good—can you turn to his pages without benefit. For the artist, more especially, there are pictures of the highest import and most entrancing beauty; they rise at every instant to his delighted gaze. Nor is this all, or even the most important and valuable portion of the advantage to be obtained by the study of that divine writer: the least impressionable finds himself influenced by the purity of his spirit, and the warmth of his feeling; the most obstinate must needs yield to the force of his reasoning, the most refractory cannot refuse to be amended by the gentle compulsion of that heart-inspired and heart-appealing eloquence, which in his pages constantly enforces lessons ever tending to the right and good.

To cite two short poems only, the "Words of Belief," and the "Words of Error,"‡ where else will you find truth so full and glorious in words so few, yet so effective? Read but these only, and be sure that if they should chance to be the first of your acquaintance with their immortal author, they will by no means be the last of your study in his works.

Leaving these, nevertheless, for the present, let us turn to "The Cranes of Ibycus;"‡ and if you reproduce on your canvas the effective picture given in the stanzas, you will perform a work that can scarcely fail to satisfy even yourself. The story may be told very briefly to such as yet remain unacquainted with its details.

Murdered in the groves of Neptune, while on his way to take part in the games of Corinth, Ibycus, the beloved of Apollo, invokes a flight of Cranes, which alone are witness of the deed, to avenge his fate. His mangled remains are found by the grieving Corinthians, who decree vengeance on his destroyers.

All are assembled in the theatre—the chorus enters, and here commences your portion of the work. You have the open theatre with its crowding masses, before whom the chorus:—

"Streng und ernst, nach alter Sitte,
Mit langsam abgemessnem Schritte,
Hervortritt aus dem Hintergrund,
Umwandelnd des Theaters Rund;
So schreiten keine ird'schen Weiber;
Die zeugete kein sterblich Haus;
Es steigt das Riesenmaß des Leibes,
Hoch über menschliches hinaus.
"Ein schwarzer Mantel schlägt die Lenden;
Sie schwingen in entfeischten Händen,
Der Fackel düsterrothe Glut;
In ihren Wangen fließt kein Blut;
Und wo die Haare lieblich flattern,
Um Menschenstirnen freundlich wehn;
Da sieht man Schlangen hier und Nattern,
Die giftgeschwollenen Bälge blähen."

Thus faithfully and efficiently translated by Sir Edward Bulwer Lytton:—

"True to the awful rites of old,
In long and measured strides, behold
The chorus from the hinder ground,
Face the vast circle's solemn round.
So this world's women never strode,
Their race from mortals ne'er began—
Gigantic, from their grim abode,
They tower above the sons of man!
"Across their loins their dark robe elinging,
In fleshless hands the torches swinging,
Now to and fro with dark red glow,
No blood that lives the red cheeks know!
Where flow the locks that woo to love
On human temples, ghastly dwell
The serpents, coil'd the brow above,
And the green asps with poison swell."‡

Pacing around the circle as here described, the awful "Daughters of Night," having announced their avenging power in a hymn of great solemnity, for which I have not space, are disappearing in the background, when across the open space of the roof comes sudden darkness, proceeding from the flock of

"The slow cranes, hoarse murmuring,"

that just then pass over. A voice is instantly heard to proceed from the countless masses:—

"Behold! behold, Timotheus!
See there—the cranes of Ibycus!"

are the fateful words it utters, and the crime of the speaker stands revealed. In vain would the murderer retract his words; his white and quivering lips complete the confession he would so fain recall. The

* "Would you touch the hearts of others,
First your own must feel the glow."

LUDWIG, *ex-king of Bavaria*.

‡ "Die Worte des Glaubens," "Die Worte des Wahns."

‡ "Die Kränche des Ibykus."

‡ "The Poems of Friedrich von Schiller." Translated by Sir Edward Bulwer Lytton.

audience, well prepared for the awakening of his conscience by the hymn of the chorists, rise—an imposing mass—declaring as one man—

"The truth we seize!
Thy might is here, Eumenides!

"The murderer yields himself, confess:
Vengeance is near, that voice the token.

"Ho! him who yonder spoke arrest,
And him to whom the words were spoken!"*

This is done, and "the dark unwitnessed crime," to borrow from the same translator, is "struck by the lightning that revealed." Your moment for this work you will have no difficulty in choosing, and may cause it to serve, as does the whole poem, remarks Sir Edward, to illustrate furthermore those lines where Schiller declares in his "Artists"—

"Secret Murder, pale and shuddering, sees
Sweep o'er the stage the stern Eumenides;
Ours, where law fails, what powers to Art belong,
And, screened from justice, finds its doom in song."†

"There is a curious piece of traditionary superstition connected with Bruce and Bannockburn," says Alexander Fraser Tytler, in a note to his *Lives of Scottish Worthies*; "but this, as it was not to be found in Fordun or Winton, I have omitted from the text."

"Perhaps I have done wrong," he adds, "since the circumstance is characteristic of the times." And he would have "done wrong" without doubt, the excellent writer, had he persisted in his exclusion of the story; but he has happily repented him of the evil in good time, and for your comfort and mine, O painters, has inserted the legend in that chapter of *Antiquarian Illustrations* which he has appended to his work. There the reader who may desire to read more will find it: the words, so far as they seem to be required for our purpose, are these:—

"Our story relates to an alleged miracle regarding the luminous arm of St. Fillan, who has given his name to many chapels and holy fountains in various parts of Scotland. Cameronius tells us that he was Abbot of Pittenweem, but afterwards retired to the wild and romantic district of Glenorquhay, where he died a hermit in the year 649. The legend asserts that when engaged in transcribing the Scriptures, he was compelled to desist from his labours for lack of light; but while grieving over this circumstance, he suddenly found that his left hand and arm emitted a supernatural effulgence, by which, without either torch or candle, he was enabled to proceed at midnight as at mid-day.

"This luminous arm was ever after preserved as a relic; and Bruce, who neglected nothing that might give confidence to his soldiers—nay, whose own mind was probably not insensible to the influence of the legend—carried it with him, enclosed in its silver shrine, to Bannockburn.

"But the king's chaplain, fearing lest that precious relic might fall into the hands of the English, or be otherwise lost, abstracted it secretly from the tent of the king, wherein he left nothing appertaining to the saint, save only his silver shrine.

"On the night preceding the battle, Robert, whose mind was filled with anxiety, could not compose himself to sleep, but passed the hours in earnest supplication to the saint, whose arm he believed to be shut up within the reliquary. Suddenly, and after long prostration of mind and body, a more than ordinary light appeared to fill the tent, and looking up, the Bruce perceived an arm extended above his head, and in the act of withdrawing itself from the shrine, the door of which stood open. Starting to his feet, in the belief that some bold robber was attacking the sacred deposit, he beheld the refulgent arm reposing within its jewelled receptacle, the doors whereof were even then closing slowly, of their own movement, as the astonished king gazed on them in awe and wonder. Turning then to examine if any man were concealed in the tent, the Bruce beheld a majestic form in the entrance of the pavilion. This appearance was in the act of departing, yet Robert recognised St. Fillan by the portrait of that holy archbishop, suspended over the altar of his oratory. Being strictly questioned, the chaplain subsequently confessed what he had done, when Bruce could no longer doubt that the saint had restored his arm to the shrine as an assurance of victory: the result of the battle, decisive as it was, the complete

triumph of the Scots, and the flight of Edward to Dunbar, could not fail to confirm his conviction."

To the Scottish artist, more especially, this tradition of the Bruce can scarcely fail to offer an attractive subject for his pencil, although we do not remember to have seen it chosen by any one of them; yet there may be more than one who has done so—seeing that the works of Tytler are deservedly popular, and are in the hands of all who read.

We are not so good, we dear people of this excellent world, but that some day or other we may find it possible to make ourselves better; and one means to that desirable result is assuredly in the hands of the painters. Let them but set before our eyes the living presentment of such things as any one among us may do towards "being good," as nurses say to the children, and the glow that one cannot but feel at heart when some great and noble action stands confessed and clear before us, may do something towards helping forward the result whereat we have just hinted. Nay, there does not always need even so much to wake up the ready sympathies of our better nature; and here, in few words, is a proof that he who does but obey an impulse, provided it be a pure and upright one, will, in so far, serve as "the electric chain wherewith" the hearts of others may, for the moment, at least, be aroused to the love and appreciation of the good and right.

In the early part of the year 1760, Commodore Thurot, an officer in the service of France, then at war with England, threw himself on the coast of Ireland, entered Carrickfergus by surprise, and for some short time was master of the town. While the French troops and those of the small garrison were then fighting in the streets, a little Irish child, unconscious of its danger, ran between the two parties just as each, having drawn off for a moment to reload and prepare, had commenced the renewal of the carnage. Perceiving the presence of the infant, and moved to compassion by its innocence, a French grenadier cast down his musket, rushed into the midst of the fire, caught the child in his arms, sprang with his charge towards the shrieking mother, who, discovering her loss, was hastening to seek the boy, and having placed him within the porch of a neighbouring house, whence the terrified woman could take him without peril to either, he hurried back to his place amidst the loud shouts of all who, on either side, beheld his humane action.

Many a deed of admirable humanity, as well as heroic bravery, you will doubtless find recorded in the annals of the late war: paint them all then, for we can scarcely have too many such; but do not refuse to let this also stand beside them—there will be room for the whole, whether on the walls of our galleries or in our hearts, do not doubt it.

Again, if in some dark day we should any of us feel more than commonly disposed to evil, here is a prescription that, if we be not wholly incorrigible, may go far to cure us of the malady. It is a pilgrimage to Lea Hurst—the home in youth, if not the birth-place, of one whose name can never henceforth be uttered in any land, but that a throb of pride, as well as a warm feeling of respect and affection, must rise spontaneously in the heart of every Englishman who shall hear the sound. Nay, we have no longer the sole property in that revered name; the virtues of her who bears it have made her an object of love and reverence to men of all nations—all claim part in her as in one who has exalted humanity—dwellers in every land are uniting to do her honour; and if those so late our enemies still look doubtfully on the mass of our country-people, they make an exception in her favour. Even the Muscovite raises his rude cap from his brows, as he would before the Panagia,* when he hears that sweet and heart-warming music, the name of FLORENCE NIGHTINGALE; that angel of mercy, for the sight of whose very shadow the sick man kept hourly vigil, and at whose approach he who lay deprived of half his members, strove to lift his mutilated form that he might look upon her.

The domain of Emblay House, in the varied and beautiful county of Hants, may likewise claim some interest in this admirable lady; and far be it from us to neglect the justly prized rights of any, in a possession so deservedly valued; but it is with Lea

Hurst, in Derbyshire, that we have now to do, and if the landscape-painter should "go in search of beauty," he too, no less than the worshipper of the morally beautiful, may find all that even his fancy can set before him in the delightful region wherein the mansion and domain are situated.

The building is of the Elizabethan style; its stone mullioned windows opening beneath many gables, and the substantial clusters of chimney-stacks rising from its roofs, giving promise of abundant hospitality; the pleasant gardens and shrubberies are enclosed within a wide-extending park, whence delightful views of a country richly diversified with hill and valley, wood and stream, gorgeously tinted rocks and emerald fields, present themselves at all points. "The Druid-crowned Riber," with the bold hills around and beyond Matlock, are perhaps among the most prominent. Scarthin Nick and the heights beyond Cromford are also to be seen from the park. It is, indeed, a place not unlikely to have assisted in the development of a pure and holy creature; for what is there so elevating, morally or intellectually, as the perpetual contemplation of great natural beauty? what so well calculated to foster the nobler impulses, to awaken the more generous sympathies, to produce, at a word, that large-hearted beneficence which has given to the subject of our present remarks that first place among women certainly now occupied by Miss Nightingale, as a constant abode in the visible presence of Him who has made us all? and this privilege is without doubt secured to the fortunate possessor of a home placed and formed as is Lea Hurst.

We do not repeat any one of the many anecdotes now current in society, and become "familiar in the mouths" of all, that might be adduced in exemplification of the remarks here made; your memory will supply you with such most amply, to say nothing of the many that cannot fail to be added to your store, whether your choice be the "faire manor-house in Hampshire," or the beautiful Lea Hurst.

Much has been said, much written, and perhaps some little painted—although scarcely so much as might be desired—of our beautiful cathedral churches; nor has the noble metropolis of Canterbury failed to obtain its share of notice. But within a mile of that structure is one which has scarcely been "marked of the painter," although few better merit his attention. The fame to which we allude is the more lowly Church of St. Martin; and there are those who maintain that this is the very building described by the venerable Bede, when he relates the fact that "in a church dedicated to the honour of St. Martin, and built while the Romans were still in our island, did Bertha, the queen, resort to hear mass and pray, until Ethelbert her husband, being converted to the faith of Christ, endowed his teachers with a settled place in this metropolis of Canterbury, bestowing on them at the same time all needful muniments, and permitting them to preach freely, wheresoever it might seem good to them."

Many proofs of its high antiquity will be found in the Church of St. Martin, by the artist who may desire to present us with a memorial of our first Christian king, for the baptism of Ethelbert is believed to have been received from its font, without doubt one of the first made in England. Other circumstances of interest attach themselves to the church: it was here that St. Augustine uttered his earliest exhortations to the people of Canterbury; here that the excellent Queen Bertha had her oratory; and here that they still reverently exhibit her tomb. To him whose heart and mind are attuned to the subject, not one of these will be without significance; and if, since the interior, although perfect in its exquisite restoration of an ancient oratory, is a restoration, he should feel chilled by the evidences of that fact presented within, let him betake himself to the pleasant churchyard without the building; the proud towers and aspiring pinnacles of the vast cathedral, though visible from that gentle eminence, need not too forcibly distract his attention from the primitive St. Martin, with its low square tower darkly mantled in luxuriant ivy; reverend yew-trees offer him their shade of ages, the purple glow of sunset shall enrich the landscape to his utmost desire, or the silvery morning sunlight, newly beaming from the dawn, shall come stealing softly over the rich green sward, where it slopes gracefully

* Sir Edward Bulwer Lytton, *ut supra*.

† Sir E. B. Lytton's Translation.

* The Panagia is the Virgin of the Greek Church.

to the plain beneath. Should he then need further inspiration for that scene of past days,—which he cannot but meditate reproducing for us, as he makes all the beautiful picture his own, while reclining beneath those majestic witnesses of an older age, the century-crowned trees that bend their broad arms over him,—let him read what Wordsworth has said concerning the place, and he can scarcely fail to find it:—

"For ever hallowed be this morning fair,
Blest be the unconscious shore on which ye tread,
And blest the silver Cross, which ye instead
Of martial banner in procession bear;
The Cross preceding him who floats in air—
The pictured Saviour. By Augustine led,
They come, and onward travel without dread,
Chanting in barbarous ears a tuneful prayer,
Sung for themselves and those whom they would free.
Rich conquest waits them; the tempestuous sea
Of ignorance that ran so rough and high,
And heeded not the voice of clashing swords,
Those good men humble by a few bare words,
And calm with fear of God's divinity."

Who that has haunted picture-galleries, whether at home or abroad, but must have remarked the eager interest with which all crowd round the artist having a story to tell—more especially if he tell it ably. This was done to some extent, a few years since, in respect to "Travelling in the Olden Time," by one of our living artists; but there is ample room for another—not to say for many another—labourer in the same field; and if he who may enter on this pleasant avocation, do not find that he has wiled all observers from the "Portrait of a Gentleman," and even "Portrait of a Lady" painters—to say nothing of many another—why then "*je perds mon latin*," but he will, and never doubt it. For whether he take Stow's "long waggon" of two hundred and seventy years since, then in the fiftieth year of their existence, or thereabouts, or give us the "flying coaches" of a later period, ambitiously aspiring to rush on at the frantic rate of "four miles in the hour," he has but faithfully to delineate "life in travel" as the annalist and wayfarer of the period have described it—boasting its advance, or bemoaning its evils, each according to his humour—and he will produce a picture well worthy to be painted in these present times, were it only as a memorial of what must else be forgotten.

For the string of packhorses, winding gravely their laborious way across vast undulating moorlands, a thick mist falling heavily, and the carriers puzzled to discern the track, there might be a claim put forward; and if a disconsolate passenger were added, doing penance between the two packs of a horse, as he wends to seek his fortune in that London whose streets were then paved with gold, there would be all the more room for the delineation of character. Or permit the moment to be a more genial one: let the sun be shining cheerily, and the vigorous train sweeping joyously forward through the fair bright uplands on a glad some morn of May: there be those of our artists who would give us to hear the very chime of their bells as they pass; and who can marvel, though the peasant maidens, depicted for us as meeting that train by the way, do linger long to behold its bravery? How lovely are they, those sweet maids of England! but alack the while, how completely deaf to the words of their matronly companion! She is doubtless warning them of dangers that may lurk in such glances as the bold drivers are bending on their beauty—but they heed her not a jot: alas, and woe is me!

Or say that you care but little for packhorses—then, though differing from you widely, let us beg of you to look at this "coach" of some hundred and eighty years back, as described by various writers of that day. "It wears two boots," says John Taylor, the water-poet; "two boots, but no spurs—nay, sometimes it hath two pairs of legs in each one of these boots; and oftentimes, against nature, most preposterously doth it make fair ladies wear the boot. Moreover, people who ride therein are forced to imitate sea-crabs, and go sideways, as do all men who sit in the boot of a coach."

Mr. Charles Knight tells us that these boots were uncovered seats "projecting from each side of the carriage;" and hearing this, one can scarcely marvel that a writer quoted by him, as travelling in this contrivance, should declare his journey to have been "noways pleasant." "For," says he, "I was forced

to ride sidelong in the boot all the way; and this travel hath so much indisposed me, that I am resolved never to ride up again in the coach." Even the dignity of his companions does not appear to have consoled our traveller, since he announces this resolution after having recorded that "the company that came up" with him were "persons of great quality, as knights and ladies."*

Neither were the roads of those days altogether irreproachable of character; and a second complainant, writing in the latter part of the seventeenth century, asks piteously, in reference to them and to the coaches:—

"Is it for a man's health to exchange the convenient fashion of travelling on horseback, for this weary cumber of sitting behind tired jades, who do not seldom lay him fast in the foul ways, whereby he is forced to wade up to the knees in mire, and then to abide in the cold until horses can be found to pull the coach out? Is it for his health to sit, long shaken in a rotten box, to have his tackle, perch, or axletree broken; wait half a day to have it mended, and then journey all the night to make good his stage?"

Perhaps not; but our grumbler may have found consolation in the merry supper eaten nightly at his inn, during the fourteen halts of "a quick passage" between York and London; or if not, the painter who shall desire to preserve for us a lasting memory of those times, may find something germane to the matter, in this singular contrast to our railway doings of the present day, when we all pass prosaically from our English capital to that of Scotland within the narrow limits of some short twelve hours.

PHOTOGALVANOGRAPHY;

OR, ENGRAVING BY LIGHT AND ELECTRICITY.

PHOTOGALVANOGRAPHY is the name of a process invented by Mr. Paul Pretsch, the late manager of the Imperial and Government printing-office at Vienna. The manipulatory details by which the copper plate, with its photographic representation, is produced, have been obligingly shown and explained to us: the results are so very different from anything which has hitherto been produced, they are of such exceeding promise, and the process involves so many interesting particulars, that we have resolved on giving the readers of the *Art-Journal* some account of an art which cannot fail to be of importance.

One of the points towards which attention has been constantly directed, since the discovery of the process by which the solar rays were made to delineate external objects upon chemically prepared tablets, has been the invention of some mode by which those impressed tablets could be easily employed to multiply the original image. Several methods have been introduced from time to time—each of them of more or less promise—although up to the present day it does not appear that any have been entirely successful.

We have seen *heliographs*—as the pictures by M. Niepce were called—etched, and some tolerably successful experiments have been made, by electro-chemical and simple chemical action, to bite into the silver surface of the Daguerreotype plate. Mr. Henry Fox Talbot patented a process by which etchings were obtained upon steel plates; but all these differ in many essential particulars from the process of photogalvanography. In order to render our description of this new and important invention complete, it is necessary that we sketch out briefly what has been done in this direction. Niepce's *heliographs*, as they were amongst the earliest photographic efforts, claim our first attention. Bitumen of Judea, in some cases softened by combination with a little of the essential oil of lavender, was spread uniformly over a plate of metal, which was then warmed, so

that the essential oil evaporating, a very smooth surface of resin covered the plate. The object which we desired to copy was placed upon this prepared plate in an ordinary copying frame, and it was exposed to the sunshine, or the sensitive plate was placed in the camera-obscura until the images of external objects were impressed upon it. On account of the slowness with which the change takes place on the resin, several hours exposure in the camera-obscura were required, and hence, from the alteration of the shadows during this prolonged period, the pictures were defective.

By exposing this bitumen, or any resinous surface to the action of the solar rays, it is rendered more or less soluble, according to the character of the agent employed. If, therefore, after exposure, the heliographic plate is subjected to the action of a solvent, one portion will be removed, while the other part will remain untouched. The resulting picture is therefore produced by the contrast between the resinous surface, and the metallic plate, from which the resin has been removed. It will be evident to all that the result thus obtained is, in fact, that of an ordinary etching surface, except that the resin has been removed by the action of the solar rays, and a solvent, instead of by the etching needle. If an acid is now poured upon the metal plate, it bites into the metal, and the result is an etching from which prints can be taken. The great defect of those productions was, that the high lights and the deep shadows were alone represented. In the experiments which have been made within the last few years, these defects have not been overcome. Some results obtained upon lithographic stones, through the medium of this process, have been of greater promise. M. Lemaitre has done much towards improving the etching process of Niepce; but owing to the imperfections already indicated, it has not yet been successfully applied to any useful end.

The Daguerreotype picture is produced by the deposit of mercurial vapour, which combines with the silver, and the polished surface of the silver surface itself. As the electro-chemical relations of these two metals are dissimilar, it was thought that the Daguerreotype plate could be etched by the agency of the voltaic battery. Dr. Berres, of Vienna, M. Fizeau, in France, and Mr. Grove, in England, succeeded, either by direct chemical action, or by electro-chemical processes, in engraving these plates, and in many examples the details were preserved in a very charming manner. Mr. Claudet was very successful in engraving the Daguerreotype picture by a modification of the process of M. Fizeau. We have now before us some copies printed from those plates, consisting of images of anatomical preparations, of portraits, and representations of statues, which are curious examples of the perfection obtained at a very early period in this art.

The next step in progress was the process patented by Mr. Talbot in 1853. This process consisted in spreading upon a steel plate a solution of isinglass or gelatine, in which had been previously dissolved some bichromate of potash. The plate being dried by warmth sufficient to coagulate the gelatine, the object to be copied is placed upon this tablet in the copying frame, and then exposed to sunshine. A curious change takes place during this exposure; one equivalent of chromic acid is liberated from the potash, and this combining with the gelatine, it is rendered insoluble. After exposure, the plate is placed in water, and all those parts which were protected from the action of the solar rays are dissolved out. The picture is now formed by the yellow brown combination, of the gelatine and chromic acid, and the steel from which the coating has been removed. There is much of interest in this

* See "Pictorial Half-hours," vol. i. p. 56.

stage of the process; and the author says, "If the plate is examined in this state, it appears coated with gelatine of a yellowish brown colour, and impressed with a white photographic image, which is often eminently beautiful, owing to the circumstance of its being raised above the level of the plate by the action of the water. Thus, for instance, the image of a piece of black lace looks like a real piece of very delicate white lace of a similar pattern, closely adhering to, but plainly raised above the brown and polished surface of the plate, which serves to display it very beautifully. At other times the white image of an object offers a varying display of light, when examined by the light of a single candle, which indicates a peculiar molecular arrangement in the particles of gelatine. These photographic images are often so beautiful that the operator feels almost reluctant to destroy them by continuing the process for engraving the plate."

The subsequent engraving process is essentially an etching operation. Bichloride of platinum, diluted with water, is poured over the plate, and as the gelatine exists in different degrees of thickness over its surface, the action is first established through the thinner films. The acid bites into the steel, and, by carefully watching the result, a very pleasing engraving on the steel may be obtained, which prints well. Fern leaves, grasses, pieces of lace, and objects of a like description, may be copied in a very pleasing manner by this process of Mr. Talbot. It is but justice to Mr. Mungo Ponton to state that that gentleman, in 1838, first directed attention to the peculiar changes which the bichromate of potash undergoes when it is exposed, in connection with organic matter, to the action of the solar rays. Subsequently, the writer of the present paper, in 1843, used this salt, combined with the sulphate of copper and nitrate of silver, in the production of positive pictures by one process—this process is known as the *chromotype*.

We must now advance to an examination of Mr. Pretsch's process. It will be evident in what respect it resembles, and in what it differs from the inventions we have already described. A plate of glass is thoroughly well cleaned. A quantity of glue is dissolved, and three different solutions are made, which we will number respectively:—1. nitrate of silver; 2. iodide of potassium; 3. bichromate of potash. To each of these some of the glue is added; the largest portion to the solution No. 3, then No. 2 is added to No. 3, and both solutions mixed together. The previously yellow solution becomes a fine red, from the formation of chromate of silver, which is held in suspension. Solution No. 2 is now added to the mixture of 1 and 3; the mixture loses colour slightly, but it still remains of a fine red colour. This mixture, which involves some very curious chemical phenomena, is poured over the glass plate, and by skilful manipulation, a perfectly uniform film of a red colour is produced. This part of the process is performed in a room illuminated with yellow light, and maintained at a tolerably high temperature. When solidified, the plate is fit for use. A photographic view, a portrait, or an ordinary engraving is placed upon the gelatine tablet, this arrangement is fixed in the copying frame, and duly exposed to the solar rays. In the course of a short time all the exposed parts blacken to a fine brown, and the lines beneath the superposed photograph or print are darkened or preserved from change, as the case may be, until eventually a copy is obtained the reverse of the original. All the dark lines, or portions of a print or of a photograph remain unchanged, all the light lines or portions darken—the degree of darkening being determined by the relative transparency of the several parts.

The glass plate is, at the proper time, taken from the copying frame and plunged into water. The picture is now perceived to be gradually developing itself with extraordinary beauty. All the unchanged portions of the plate are rapidly dissolved off, and consequently the picture is produced not merely by differences in the colour of the surface, but by variations in the thickness, corresponding with the amount of actinic action which has taken place during the exposure of the plate.

When the proper effect is obtained the process is stopped, the surface is dried off with blotting paper, and the plate preserved for the subsequent manipulation. It will be understood that the chromic acid of the bichromate of potash at the moment of separating from that salt, when the actinic change is effected, combines with the gelatine, and renders it insoluble. Hence in the picture we have several thicknesses of the gelatine film, representing the high lights, the middle tones, and the deep shadows, with all the beautiful gradations between these which are obtained in a highly-finished collodion photograph.

This constitutes the photographic part of the process of Mr. Pretsch, the remainder of the manipulation being the preparation for, and the carrying out of, the electro-chemical preparation of the copper plate from which the photogalvanographs are to be printed. The photograph being placed upon a firm bed, a sheet of elastic gutta serena is spread over it, and subjected to some pressure; this receives a very perfect impression of the picture, all the lines, howsoever delicate, being faithfully preserved. When this hardens, its surface is prepared so as to render it conducting, and it is then subjected to the ordinary electrotype process; being placed in a cell filled with sulphate of copper, and connected with a plate of zinc in a porous cell excited with dilute sulphuric acid. Thus a sheet of fine copper is precipitated upon the mould, and a plate, the reverse of the mould, is obtained. It will be evident to our readers that we are thus enabled to obtain either a raised image or an engraved impression. At present, the processes for printing from plates *in relief* are not sufficiently perfect, but the prints taken from the engraved plates are in a very perfect condition. In these, for the first time, we see all the minute details represented, with the half-tones as finely given as the high lights or the shadows.

In the establishment at Holloway, arrangements are made for carrying out Mr. Paul Pretsch's patent commercially upon a large scale; and from the specimens we have examined, we are satisfied that the productions of the camera-obscura must soon be commonly employed for all purposes of illustration.

We have heard much of the fading of photographs; we have repeatedly stated our conviction, the result of upwards of sixteen years' experience, that photographic pictures need not necessarily fade. Where they do fade—and we know that some of the finest works which have been produced have rapidly perished, or are perishing—it is due to imperfect manipulation. Much of the deterioration is due to the practice, as it is called, of *toning*. By this practice agents are introduced into the paper which act slowly but surely upon the silver of the photograph, and eventually effect the destructive change. Every condition of tone can be produced without any of these *toning* agents, by the use of different chlorides in the preparation of the paper upon which the positive print is obtained. Photogalvanography, however, relieves us from the risk of possessing fading pictures. Here we have pictures possessing in the highest degree the perfection of the original photograph, and the permanence of a copper-plate print.

THE ROYAL PICTURES.

MARY ANOINTING THE FEET OF CHRIST.

P. P. Rubens, Painter.

W. Greatbaeh, Engraver.

Size of the Picture, 1 ft. 8 in. by 1 ft. 3½ in.

RUBENS, among all the painters of the Dutch and Flemish schools, was undoubtedly the most consistent exponent of Christian Art. By the term "consistent" is meant that his conceptions are most in unison with those lofty and holy feelings which should always be found in everything connected with sacred subjects. None of the works of Rembrandt, Vandyck, Jordaens, or any other painter of these schools, approach in religious sentiment the compositions of Rubens. And yet how far is he behind the great artists of Italy!—Gaudio, Carlo Dolce, Paul Veronese, Raffaele, the Caracci, and the host of stars of lesser magnitude: even his visit to their country, and the study of their works, in Venice especially, had but little effect on his style in the particular referred to. The truth is, the mind of the great Flemish painter wanted the repose necessary to qualify him for the task of an illustrator of the facts narrated in New Testament history: it was too active, too energetic, too full of movement, to express the tranquil and devotional sentiments which harmonise with all one reads of in the lives and actions of Christ and his immediate disciples—of too exuberant and florid a character to be restrained within such limits as can only be legitimately assigned to such subjects. In all the Italian painters, distinct as they are from each other in style and manner of treatment, there is a uniformity of feeling which seems to unite them together. In the works of Rubens we are captivated by the richness of his conceptions, the vigour of his drawing, and the brilliancy of his colouring—these all speak to our senses in the most powerful language; but we turn from looking at one of his pictures—we are speaking of his scriptural subjects only—with an ardent wish that the fire of his genius had been chastened by the devotional feeling visible in the Italian painters. Even in the noble picture of the "Descent from the Cross," in the Cathedral of Antwerp,—perhaps the most sublime and affecting subject presented in the whole range of scripture history,—there is comparatively little to elevate the thoughts to the solemn dignity of the scene portrayed: the masterly grouping of the figures cannot be surpassed; the grandeur of the conception, the powerful execution, and the richness of the colouring, unite to excite our admiration; but the heart of the spectator is not stirred into reverential awe, nor will a tear of pity be wrung from his eyes by any amount of pathos he will find therein.

The genius of Rubens, it has been correctly said, "was adapted to the grandest compositions; and his powers appear to have expended themselves in proportion to the scale on which they were called upon to act. He did not, like Raffaele, possess that mild inspiration of sentiment which manifests itself in the graceful and beautiful, but he was animated with that poetic fire that displays itself in effects, which astonish and surprise. His most abundant compositions seem to have been produced without effort, and creation appears to have been an operation of his will."

His picture of "Mary anointing the Feet of Christ," in the collection at Windsor Castle, is a sketch—executed in bistre, or some colour of a similar tint—for the large painting in the Imperial Gallery at St. Petersburg. "It is conceived," says Mrs. Jameson, "with that dramatic power, and touched with that vigour and ease, which characterise Rubens when he painted from out of his own soul and fancy." On these points there cannot be a second opinion; but at the same time it manifests in a high degree what we cannot but consider the defects of this great painter. Life and action seem here out of place altogether: the act of Mary is of solemn import, and must have been witnessed by the disciples with wonder, awe, and silent admiration, and yet life and action are displayed to an extent almost painful to the eye—even the draperies seem in motion, in the multiplicity of their folds and the tortuous motion in which they are disposed; still the arrangement of the whole group is most masterly, and the general effect rich almost to a fault.

MARY ANOINTING THE FEET OF CHRIST.

FROM THE ENGRAVE IN THE ROYAL COLLECTION.

THE CRYSTAL PALACE,

AS A TEACHER OF ART AND ART-MANUFACTURE.

PART I.

It is our purpose to describe in the *Art-Journal* a series of ILLUSTRATED VISITS to the Crystal Palace at Sydenham; undertaken with a view to draw more general attention to the many remarkable features in which it abounds, in order that the educational advantages offered by this institution, beyond the attractions of a mere "London sight" (in that respect alone unrivalled), may be more fully recognised and appreciated.

We are induced to this notice principally from the fact that, although to a large extent popular, still it has not hitherto met with that cordial, steady, and general support which its purpose merits, and which can alone adequately remunerate the immense cost of its establishment. The resources of the Crystal Palace present the means of aiding educational progress without a parallel in this country, and every inducement should be held out to encourage the operative classes to select its locality for the enjoyment of the periodical holidays which national custom has established; while to those more favoured in circumstances we may recommend a frequent attendance as a source of intellectual gratification and improvement. Its influence cannot but have a most beneficial tendency; the association, even by uncultured minds, with such examples of Nature and Art as there arrest the eye at every step, insensibly induces a spirit of emulative action. The suggestions

afforded by the various objects, both in regard to the tasteful arrangement of natural productions, as well in their separate features in combination with works of Art,—suggestions which, to a considerable extent, are easy of adaptation to the refinements of ordinary homes,—are such as will gradually but surely attest the value of their lessons.

Intuitive taste is not altogether of rare occurrence among the humbler classes, and it arouses a grateful feeling to witness its evidence, however simple the manifestations. The homely porch becomes an espalier upon which the woodbine, rose, and honeysuckle, trailed to tasteful growth, bloom with a luxuriance and grace that palatial gardens seldom rival. The advantages which have been almost exclusively those pertaining to a rural population are now offered to the inhabitants of our crowded metropolis, and we are sanguine that their enjoyment will eventually exercise a marked and hopeful influence upon the national character. For it is worthy of remark, that the feeling excited by contact with the beauties of Nature and Art generates a propriety of demeanour in itself of an improving tendency.

We cannot adduce a more forcible and conclusive illustration of this assertion than by reference to the orderly conduct of the people, even when congregated in crowds in our public exhibitions and parks. A few years since, such a result would have been doubted, if not denied; and the fact pleads strongly for a more general extension of such humanising influences as these attractions give rise to.

Moreover, it is worthy of especial note as a peculiarity of this institution—the opportunity it affords to ladies of enjoying intellectual amusement in such

a manner as is compatible with the requirements of the most unexceptionable taste. In this respect the Crystal Palace stands alone. A day may be pleasantly and profitably spent there without the risk of subjection to a single casualty that might interrupt its enjoyment or mar its retrospect; ladies may at all times visit this establishment unaccompanied by "protectors."

We have frequently heard expressions of regret that the portions of the Exhibition which are essentially of the highest character, are those which are least appreciated. But this, we submit, is a very natural result of an experiment so novel and elevated in its aim. The majority visit it as a show—a show on a grand scale it is true, but omit to accept it as A SCHOOL: and yet in the latter capacity is its chief utility and its highest purpose. Still there is a large and increasing minority who are becoming alive to the value of the educational advancement which the material compressed within the exhibition range of the Crystal Palace is capable of forwarding; and we are most anxious to assist in further demonstrating the value of its resources, not only in their intellectual ministrations to the pleasures of the public at large, but especially to that portion of the industrial classes whose labour is in any degree connected with, and influenced by, Art-knowledge. To the MANUFACTURER, and DESIGNER in connection with MANUFACTURES, it opens a field of suggestive study as useful and essential as it has hitherto been unattainable. The examples of decorative ornament in various styles exemplified in the Art-Courts are invaluable as references and guides to the artist in adapting established principles to modern applications. There

THE CERAMIC COURT, CRYSTAL PALACE.

is now no excuse for the anachronisms which have formed so marked and melancholy a feature in the bulk of English Art-manufacture. Ignorance on this ground is now absolutely wilful, and therefore culpable. Not only are the best examples in the various distinctive styles of ornament separately classified, but distinguished as to the period of their execution, and the localities from which they were taken. Permission to sketch from any of the examples is, we believe, readily given upon application to the Secretary.

Unprecedentedly rich in all the elements which are

essential to success, we are sanguine that with judicious direction this will be permanently secured. But we must remark, at the outset, that no course should be adopted, however it may recommend itself by a temporary addition to the finances of the establishment, if the ultimate effect may be derogatory to its character. The permanent interests, even in a commercial view, are jeopardised by such expedients, which are as short-sighted as they are fallacious.

We would advocate the maintenance of such a character for the Crystal Palace as should eventually secure its adoption by the nation, should circum-

stances render such a course necessary or advisable. A grant for such a purpose would be both popular and judicious, and will probably be its final destiny: let it preserve a position worthy of such a conclusion.

This can only be done by realising the high aims which, upon its foundation, were claimed as its basis, and urged as motives for its support. It was to contain a selected epitome of the most noted marvels of Science, Art, and Manufacture. The matchless site, and accompanying requisites of space and other appliances, offered facilities for the deve-

lopment of natural beauties on a scale of surpassing magnitude and splendour.

To a very considerable extent, and in some of the most important and difficult portions of the task

JEWEL VASE.

these promises have been realised: failure has followed almost entirely where success was most easily obtainable.

From the special nature of our work, we are restricted—except in general and cursory remarks—to the consideration and illustration of those portions of the Exhibition which refer directly to Art and Art-manufacture of a purely ornamental character.

The taste and judgment demonstrated in the selection of the Art-exemplifications furnished by the decorations of the various Courts, and which crowd every part of the building available to their fitting display, are of a high order; and the enterprise and energy employed in the collection of such a mass of material, in many instances unique, are deserving of all commendation.

It is almost superfluous to allude to the perfect disposition and arrangement of the floricultural department of the Palace and Park, or to do more than refer to the grandeur of the water-works,—in these respects alone, independently of the novel beauty of the structure, it stands a proud evidence of the skill and taste of Sir Joseph Paxton.

Here is a success—probably in some minor details qualified, but still a positive if not a complete success. Herein lay the essential and unavoidable difficulties, and they have been overcome. Failure ensues where it might have been least anticipated, and where it seems by want of ordinary judgment to have been provoked.

As a medium for the illustration of manufactures, especially those in connection with Art, the Palace presented advantages altogether unparalleled. A building with almost unlimited capacity to receive, and unexampled facilities for exhibiting, industrial products, combined with attractions that necessarily insured a large publicity, presented a desideratum at once apparent and admitted. Unfortunately, its commercial aspect alone was estimated, and the consequence was that, presuming upon what has since proved an exaggerated value, so high a demand was made for exhibitive space that the highest class of manufacturers, with few exceptions,—those whose works would have formed attractive and worthy features in the programme,—withdrew from all co-operation, and left its occupancy to those who, deciding to accept terms so highly rated, did so with the determination to seek a return for their investment by any means which their commercial interests might require; and these naturally were of such a charac-

ter as to inflict a serious and lasting injury upon the best interests of the institution.

The question of "rental" for exhibitive space has hitherto been a fatal one to the management of the

PASTORAL VASE.

Crystal Palace; and for this reason, and knowing how much the position and success of the scheme depend upon its judicious settlement, we devote more time to its consideration than we should otherwise deem necessary; for though past experience has inculcated some useful lessons on this point, still it appears to have enforced but a qualification, instead of an abrogation, of the old, unwise principle.

GROUP OF PORCELAIN, OF SEVRES, DRESDEN, ETC.

The amount of rent paid will always be in an inverse ratio to the value of the works exhibited, and the status of the exhibitor. No manufacturer of eminence, whose productions are costly, and of

a merit placing them beyond the demands of ordinary trade requirements, will be content to pay largely, if at all, for the admission of a class of works whose exhibition must form an attractive and

elevating addition to the *materiel* of the Crystal Palace.

It is on this ground that we advocate the abolition of all claims for space in the principal courts erected

for the reception of special branches of manufacture, and the substitution of a system determining the qualification of "exhibits,"—so as to secure such works as shall be in themselves either individually or collectively a source of remunerative attraction. Certainly all direct *trading* should be confined to the galleries, where no possible objection would be made to its operations.

The Industrial Courts might then be devoted to the purposes for which they were created; and upon such a system as we advise would, without doubt, be gladly accepted by the trades as a **PERMANENT LOCALITY** for their illustration.

This arrangement effected, we would recommend every manufacturing town of established importance, and every town whose industrial efforts are working out a prospective fame, *to have its staple trade fully and adequately represented in the Crystal Palace.* This task should not be treated with indifference, or left to the individual enterprise and judgment of one or two persons interested in the trade; but should be incurred as a responsible duty by a local committee, formed in the town, and acting for the general body, whose interests it should represent.

Whatever objections might have been in times past urged against the practicability of such a plan, they will not, we believe, now apply. The petty spirit of trade jealousy is gradually weakening with the increased intelligence of the commercial world,

and it is felt that the interests of one are the interests of all.

It is impossible that one or two manufacturers, however eminent their position and admirable their productions, can efficiently and comprehensively represent the capabilities and resources of any trade which presents varied fields of action.

Our impression is, that eventually the special branches of all important manufactures will each absorb the capital and energies of separate producers; and the result will be such a development of mental application, and such a perfection of manipulative facility, as is altogether unattainable and hopeless, while the attention is divided amongst a variety of claims.

We might, in corroboration of our assertion, cite instances of branches of manufacture, but a short time since considered of secondary and minor importance amidst the prominent demands of more established trade sources, which, when separated and worked apart, have, by a concentration of mind and action, grown to significant and engrossing specialities.

Manufactures of the national importance of Man-

chester, Birmingham, Sheffield, Glasgow, the potteries of Staffordshire, Worcester, Coalport, &c., &c., should be represented by separate and complete groups of illustrations, selected by local committees in each district, duly qualified to estimate the merit and extent of its productions. Such an arrangement could not fail to have an important influence on the trade of those towns, more especially in connection with their foreign commissions. Scarcely any foreigner of distinction, either in rank or commerce, but would have his attention arrested by such a display in a locality which attracts all.

We have frequently had occasion to remark that British manufacturers, when they produce meritorious works, find it extremely difficult to have such works appreciated, *merely because they cannot be seen.* It is a leading feature of the *Art-Journal* to engrave, as well as to describe, productions which the producer desires to place before the public,—not alone that their value may be understood, but that, by elevating the general character of the manufacturer, the requisite recompense of his labour may ensue.

But although we do much in this way, and very materially advance Art-manufacture by our frequent reports of progress, our means are necessarily limited. Some place was needed where a large collection of improved productions might be examined. This want is now supplied by the Crystal Palace, under the best possible circumstances: they are daily ex-

THE SHAKSPEARE SERVICE OF MESSRS. KERR AND BINNS.

hibited to the wealthiest and most intelligent classes; may be seen at leisure; may be purchased, or duplicates ordered; and an estimate can be formed of the capabilities of the manufacturer to produce works more varied or more common than those he here exhibits. In short, those who have "wants" may be here led to consider how their requirements can be best supplied. We desire to see the Crystal Palace converted into a huge "pattern-room," so to speak, where every good producer of Great Britain shall have place and space; and believe that thus the highest duty of the Directors will be fulfilled, and the interest of manufacturers be best promoted.

With these general remarks and suggestions, we proceed to report upon the special objects we have selected for illustration and comment. And we commence with **THE CERAMIC COURT**, now in progress—as it not only embodies the principle with regard to the admission of its "exhibits," which we advocate for general adoption, but also most satisfactorily attests the success of an experiment. For this Court

is to be regarded as an experiment; if an admitted success, it will certainly be followed to a large extent; and that it will be successful is, we think, proved beyond a doubt—successful as a school, as an exhibition, and as an advertisement (using the word in its higher sense) for the exhibitors.

The Directors have been singularly fortunate in obtaining the assistance of a gentleman admirably qualified for the task: they have placed this Court entirely under the control of **MR. THOMAS BATTAM**, who for many years superintended the Art departments of the works of Mr. Alderman Copeland, at Stoke-upon-Trent. No one in England has had larger experience in all that appertains to Ceramic Art: he is learned in its history and intimately acquainted with its practical details, entirely independent of any special interest, and entitled to and receiving the confidence of all British producers. It will be seen also that he is powerfully aided by "collectors," whose stores have been placed at his disposal. The result is, consequently, a very great

success; but although Mr. Battam's advantages for this post have been many and great, we do not doubt that the Directors of the Crystal Palace may obtain equally beneficial co-operation in reference to the other branches of Art-manufacture which they design to honour and to represent.

In this part of our Journal then, we shall confine ourselves to **THE CERAMIC COURT**, treating, in succession, **THE OTHER COURTS OF ART-MANUFACTURE.**

With Mr. Battam, as we have intimated, originated the proposal to form a Ceramic Court, which should contain an historical collection of pottery, from the earliest ages to the present; it is under his direction, and by him the examples have been selected and arranged.

No work is admitted but what, in regard to ancient and foreign manufacture, is interesting as illustrating the beauty or peculiarity of a special style; and, as regards modern manufacture, no work will be received for exhibition but what is of the highest excellence. This was promised at the announcement

of the project; and this promise, as far as at present developed, is entirely and faithfully realised.

Whilst looking at the marvellous beauty of the various works which adorn the collection, the zeal that has linked so many names of historical eminence with the early prosecution of the labours connected with this Art, is fully justified and explained. Its operations are "specialised" by the repeated similes which Holy Writ furnishes as suggested by their observance—operations which in some instances remain to this day practised in modern manufacture with but little modification. Indeed, were it possible to resuscitate the mummy of an Egyptian Thrower, he could readily find lucrative employment at our Minton's and Copeland's—the lapse of more than three thousand years having left unchanged the manipulative process of his handiwork.

As we have in a previous number of the *Art-*

Journal detailed the system upon which the Ceramic Court is based, and the object its completion is intended to effect, we shall proceed to describe some of the principal examples, and continue this illustration.

tion from time to time, selecting specimens the most perfect and interesting, both ancient and modern, of English and foreign manufacture.

To the HON. GENERAL EDWARD LYGON, the Directors of the Crystal Palace Company, and the public generally, are deeply indebted for the liberal spirit which prompted him to permit the exhibition of a costly and large assortment of specimens from his famous collection. It was a noble act, and will, we are confident, in its results be gratifying to him. To manufacturers engaged in this branch of Art it must be especially interesting, and its examination highly suggestive and useful.

The excellence and beauty of these works fully account for the almost fabulous prices realised for such articles in recent sales—we have written "such articles;" but unfortunately the prestige and value

which virtually belong to works of such rarity are, through want of judgment and the mania of the day, extended to a class comparatively worthless.

The figure-painting on the productions of Sèvres and Vienna, the jewelled ware and portraiture of Sèvres, are marvellous both in their richness of colour, elaboration of finish, and brilliancy of glaze. It seems a matter of regret that in many instances such exquisite gems should decorate articles of mere ordinary utility. To put them to the uses which their forms denote would be an act of desecration.

We have selected for illustration from this valuable and beautiful collection a jewelled vase of great richness, and exceedingly good in form; a vase, also of Sèvres, the principal feature of which is a pastoral subject, extending over its circumference, representing a Bacchanalian procession, the groups on which are worthy of Poussin. The variety and grace of these, together with the brilliancy of the colouring, are of the highest class of Art.

We have also a group representing a jewelled cup, and vase with portrait, of Sèvres, together with a chalice of Limoges enamel, mounted in gold. All these are of the rarest excellence; indeed, judging from the uniform merit of the specimens which, by General Lygon's liberal kindness, Mr. Battam has selected, we can form a very high estimate of the judgment and taste of the collector.

Of the modern works, we have selected for engraving in the present number a group from the Shakspeare Dessert Service, from the Royal Porcelain Works, Worcester, under the spirited proprietorship of Messrs. KERR and BINNS. This work is executed by a combination of parian and porcelain; the figures being in the former material, and the ornamental portion of the service in the latter. The junction of the two is very judiciously managed, so that the unity of the work is strictly preserved.

"A Midsummer Night's Dream" is the play selected for illustration, and is happily chosen—its character being light and ideal; and its *locale* being in classic Greece, suggests the adoption of those forms which have become the acknowledged perfection of Art. The service is of great extent, and its production must have been a labour involving a large expenditure of time, talent, and capital. Among the groups are those of the "Athenian mechanics rehearsing the lamentable comedy of 'Pyramus and Thisbe,'" "Sweet Bully Bottom and Wall," "Moonshine and Thisbe," "Quince and Flute," "Bottom with the ass's head and the Tinker," each of which forms a base to an elegantly-formed fruit-basket. The centre piece is entirely devoted to fairy ground; it is a fanciful construction, divided into three groups, illustrating the jealousy, revenge, and reconciliation, of Oberon and Titania. In arrangement, design, and decoration, the work presents claims to very high consideration; the individuality of character in the various figures is most admirably expressed.

The plates are decorated with medallions of Shakspeare, Melpomene, and Thalia, supported by Grecian chimera, embossed on the ware; the centre displays some classic symbols of Night—as Diana's head, the owl and torches, &c. &c., each centre being different. The borders on the verge of the plates are of an appropriate character, and varied.

A figure of Shakspeare is represented sleeping on a bank whilst in the act of planning his comedy; and the deification of the bard is illustrated by Fame. Two statuettes of Tragedy and Comedy also form portions of a work which, as a whole, we must pronounce to be highly creditable to the manufacturers, evidencing a spirit of taste and enterprise rarely equalled. The figures were designed and modelled by Mr. W. B. Kirk, an artist of unquestioned ability; and the forms and general arrangement of the decorative devices were designed by Mr. R. W. Binns, one of the proprietors. We shall refer to other works by this eminent firm in a future number.

We give also on this page a few of the translations of the ancient Etrurian vases contributed by Messrs. BATTAM and SON, and produced at their establishment in Gough Square. The class of work to which these examples refer may be ranked under the head of Reproductive Art. The historical, mythical, and domestic events which their illustration typifies, form vivid and instructive records of the manners and customs of the ancients. The date of these original productions extends from the second to the fifth century of the Christian era. The

diversity and elegance of their forms bear conclusive evidence of the grace and beauty with which a refined and cultivated intelligence can mould even the objects which minister to the humble and familiar purposes of household wants. These works have been imitated in nearly all the cities of the continent; but it is only just to Messrs. Battam and Son to say, we have never examined any of merit equal to theirs.

We have selected various examples from the collection of Messrs. Minton, Copeland, and other eminent firms, which are in the hands of our engravers; but the illustrations that immediately succeed will probably bear reference to the contents of one of the other Courts of Art-manufacture. This exhibition—that of THE CERAMIC COURT—though necessarily incomplete at present from the comprehensiveness of its grasp, and the short time as yet

devoted to its formation, is still of unrivalled excellence. Such a display has never before been presented to public inspection, and it is not too much to assert that to few will its examination be other than a

source of admiration and astonishment at the capabilities of a manufacture in many respects presenting features so startling and peculiar, and one in which England at the present time takes so high a rank.*

* In preparing these Engravings, we have derived much valuable assistance from the photographs of Messrs. Negretti and Zambra, whose establishment is in the Crystal Palace, and who are always at hand to execute any orders they may receive. Their works are of the best class; indeed, as specimens of photography, they are of rare excellence. This fact should be known to manufacturers; inasmuch as, by the aid of these gentlemen, they may at once obtain an accurate copy of an object, or part of an object, of which they desire to avail themselves for purposes of their Art. It would be well if every workman's atelier in our manufacturing districts were filled with photographs of ever useful "authorities;" and arrangements for such a supply might be made on "easy terms" with Messrs. Negretti and Zambra.

THE ROYAL ACADEMY.

SCULPTURE.

IN view of those new arrangements which at no distant period are destined to affect the lecture-halls and exhibition-rooms of the Royal Academy, it might seem needless here to throw away any large amount of remonstrance on the character and dimensions of that material dungeon to which, so far as regards the institution in question, the most spiritual of the Arts has been for many years consigned. When those arrangements shall be actually in progress, it will be the fault of the sculptor-academicians themselves if—numerically strong enough in the governing body for the purpose as they now are, and certain to be supported by the friends of Art in parliament and of the press—they fail to bestir themselves effectually for the redress of a wrong in which their body has too long acquiesced; and for this reason it is that a few words on the wrong itself should, nevertheless, not be deemed out of place. The injury to that branch of Art for which, to a certain extent, the sculptors of the Academy are trustees, has been of more kinds than one; and, if the Sculptor is, as we believe, the great spiritualist of Art, and the keeper of those canons to which its professors in other departments must again and again return for refreshment from the seductions of fancy, and recovery from the bewilderments of caprice, then the interests of which these academicians have charge extend far beyond what seem to be immediately their own. Of injury to themselves, the most direct and obvious form is that which presents itself in the impossibility of finding spaces from, or lights under, which the individual works of Sculpture can be viewed. All the accessories that help this form of Art, in its more imaginative displays, are disturbed by such a fact. On the floor of this dim sculpture den, the pale marble forms combine with each other, and with the living forms that vainly hover around them, in a way that defeats all Art intention, and substitutes for it a succession of epigrams. The familiar here inevitably jostles the transcendental, and unspiritualises it; the real so treads on the ideal as to disenchant it. The mischief produced on the material aspects of the works themselves is fortified by the mischief induced in the mind of the spectator. For abstraction there can, under such conditions, be no chance whatever. The sentiment proper to Art in the most transcendental of its forms takes flight at the very door of the temple. The aspect of the room inevitably lets down the elevated mood necessary for the appreciation of Sculpture to the inspiration of a china-shop. The *genius loci* amid such accidents has no room for the sole of his foot. The feeling—almost solemn, always serious—that breathes from the marble forms which the hand of genius has invested with the spirit of beauty, is disturbed by the mischievous associations of the place. Nor let it be supposed that a fact so seemingly extraneous and unessential as an unfavourable place of exhibition, if long continued and under authoritative sanction, will have no effect on the final destinies of the Art. Like most other things—and more than most other things, because of its highly sensitive nature—Art will reflect the accidents amid which it has to strive. All the penances to which it is exposed will show in the relaxation of its muscles and the maceration of its limbs. The growth of a national Sculpture will represent the sum of all the influences by which it is surrounded; and of all the forms of Art this one is likely to accommodate itself most sensibly to the dimensions and capacities of its visible tenement. At any rate, if the method of neglect to which we have alluded were not an original injury to the Sculptor himself,—as, in his highest manifestations, the greatest of Art-teachers,—it would still be a serious wrong to the people whom he has to teach. We call, therefore, on those who represent him within the walls of the Academy to look well to it, that in the apportionment of the new galleries which must ere long, in the same locality or elsewhere, replace the present inconvenient exhibition-rooms in Trafalgar Square, his future interests and those of the public—derived through him—shall be cared for after a fashion very different from that of the past and of the present.

Whoever the sculptor may be who has had the

arrangement of the present exhibition, appearances would seem to indicate that his zealous co-operation towards the better condition of things here enforced may be confidently reckoned on. It would appear to have been his deliberate object, in prospect of the coming changes, to give to the absurdity of the present accommodations such an emphasis as shall render anything approaching to a repetition of these impossible. More than ever does the floor of this preposterous cavern seem crowded with its marble population, and more unpromising than ever seems the enterprise of steering through the intricacies of its scattered groups—gliding safely round its dangerous corners, and passing into its narrow and mysterious recesses, that at once invite and repel, like the uncertainties of an Eastern tomb. The difficulty, and at the same time unfruitfulness, of this enterprise, the arranger has contrived to increase by withdrawing one half of the imperfect light which at any time found its way through the single window that looks upon this cellar-Olympus. The means by which this ingenuity is achieved is extremely simple—merely the device of raising the canvas screen to the entire height of the window in question; and the perfect success of the experiment we had the opportunity of proving in more than one unsuccessful attempt—during some of the gloomy days which at the opening of the Exhibition were favourable to the artist's design—to read the catalogue in almost any part of the room. Of course, under such a dispensation, it is not to be expected that the works should give any definite report of themselves; and we, who have by dint of patience and perseverance achieved such an acquaintance with them as was possible under the circumstances—who have waited for partial illuminations and followed on the track of straggling beams, to dodge round awkward projections and dive down questionable lanes—can state that, if an attempt to bring out this strong expression of the incapacities of the place could at any time be justifiably made with a view to a different future, the present year was not ill chosen for the purpose, as one in which it could be done with less of sacrifice than on many other occasions,—since, as an exhibition of national Sculpture, the one before us is, in some respects, more discouraging than any that we have had at the Royal Academy for several seasons past.

As this, in view of that onward progress in Art generally which is visible amongst us, is a startling circumstance, it is pleasant to be able to state that it is not by any means so significant as at first sight it seems. A further examination shows that the blame is due less to the sculptors themselves than to the influences amid which they work; that, in fact, the genius of Sculpture has been accommodating itself, after the common law, to the conditions of its lot. In the first place, let us observe, that the whole of the case as regards British Sculpture is not represented within the walls of the Academy. For a number of years past there has been a diminished eagerness on the part of some sculptors, and a growing reluctance on that of others, to exhibit their works amid a system of accidents which ensure an imperfect, or threaten a false, interpretation; and the exhibitions at the Royal Academy have, in consequence, been more or less affected by a diversion into other quarters from those items which contribute to make up the sum of the year's sculpture account. In as far, however, as the exhibition of the present year must be taken to represent the general condition of the Art, let us turn to the catalogue, and see if it furnishes any clue to this condition. Here we find that the works claiming to be considered as works of Sculpture, are one hundred and fifty-six in number; and of these, quite two thirds are portraits,—the very large majority belonging to that least satisfactory form of portrait, the bust. Now, admitting that in many of these busts the marble takes as much of the character of life as seems possible to the limited conditions of the class—that, exhibiting all the qualities which contribute to the perfection of that form of Art, they report, so far as the class can, most satisfactorily of the excellence of the school to which they belong; yet, let us ask, what high things are to be expected of a school thus habitually exercised? The sculptor—who has to live by his art—can pipe only to those tunes which will be danced to,—and if the public have no love for transcendental Art-music, all that it can expect from him is, that he shall be a master of his instrument even when he applies it to com-

mon themes. It is very obvious, however, that by such themes the highest capabilities of the instrument can never be brought out. If the talent of the great majority of English sculptors be driven by the set of the current too far and too long into the stream of portraiture, it will be difficult for the artist to struggle back into the fields where, of old, the Greek found and embodied the Immortals. Fancy, the most transcendental of the Arts degraded to the merely mechanical office of the tenth transmission of faeces, foolish or otherwise,—too often of faeces which an art whose first principle is eclecticism would shun as its natural death! This steady settlement of the spiritual Muse towards low contemplations *must* unspiritualise her: the habit, carried too far, of working from such ordinary models (where they are nothing worse) will leave an influence upon Art, which an occasional return to the fountains of beauty will be powerless to counteract. Even where the living subjects copied belong to the better types which humanity can supply, still, there can be no doubt, that this continued practice of the mere materiality of Art, this constant modelling of cheeks and noses,—where, even in the best instances, the consummate hand does all, and the poetical heart nothing, where loftiness of conception, tenderness of thought, and the sentiment of beauty, are all faculties unemployed,—must have a tendency to deaden the sensibilities and narrow the powers of the Sculptor. His very success in this department is one to which his art itself was not a motive, and to which its spiritualities have made no contribution.

From that minority of the works in the present Exhibition, in which the poetry of the Art *has* been attempted, we gather the same report,—favourable to the Sculptor himself, but denunciatory of the conditions amid which he works. All the qualities of the Art short of the highest—but without the highest, be it observed, the true Artist should consider all the rest as nothing—have for years past proclaimed themselves in the practice of the English Sculptor:—excellent modelling, clear intelligence of the capabilities and limits of the Art, consummate workmanship, and on his own part sufficient evidence of a leaning towards the abstract and imaginative, amid all the outward discouragements by which that leaning is repressed. Year after year (we speak, of course, generally, for there have been many exceptions), he has exhibited less of extravagance, and a nearer return to that pure school which has the old Greek canons for its guides. A simpler style of Art, and a more careful manipulation, have to a large extent replaced the allegorical puerilities and florid exaggerations of his predecessors; and the Sculptor has been gradually learning to admit that the history and poetry of his own land may furnish the materials of Art in its highest expressions; and that to go to the Greek (generally, for there are the exceptions of those rare and beautiful abstractions, like *Psyche*, which the poetry of every nation has taken into its heart) for his themes, while in search of his principles, is exactly to miss the latter at the same time that the appeal to the English heart is missed. In a word, the technicalities of the Art have been steadily perfecting, its sounder principles spreading, and its language consummating. Here, then, we have the Sculptor so far, as becomes his mission, leading that forward move in Art which is announced by many signs, and which cannot leave him behind because it cannot complete its work without him. Here we have him at that point of progressive Art when the full growth of its capacities may be said to have been attained, and he is ready in his matured strength for loftier efforts *when they shall be required of him*—waiting, in fact, for that appreciation of its higher aspirations which (apart from the material rewards that it includes) is the element on which genius lives. Here we have him, furnished, and waiting for the PATRON by whose means alone can be kept fed and burning the crucible which is to transmute all these qualities into the fine gold of the highest Art; and the unsatisfactory aspect of this present exhibition is accounted for by the fact that neither in the public, nor in the government which should replace it, has that Patron yet been found by the Sculptor. We could say much on these heads; both as to the character of the shortcomings on the part of the English Sculptor, and as to the manner and degree in which they are traceable

to the neglect which he has met with from the authorities at home—where that neglect has not been substituted for injurious treatment. If the English Sculptor be not a prophet in his own country, it is the country's fault, not the English Sculptor's. But we shall have, and mean to take, other opportunities of urging these matters on the attention of the public, and, if possible, of those in high places who are responsible to the public in this matter; and, meantime, we must content ourselves with a few short remarks on such of the individual works of Sculpture in the present exhibition of the Royal Academy as seem to call for it.

We are in the month of June, and a month is really a gain both to the visitor and the sculptor, for the outline of some of these works—the most remote from the window—which were invisible in May, came in June be faintly traced, with the assistance of a light distributed by a balloon-blind, which booms into the cellar like the well-filled foresail of an American clipper.* We recognise in the sites of honour two busts of the Queen, one by the BARON MAROCHETTI, the other by DURHAM. It is painful to contemplate the former work, and the only relief experienced by the spectator is that he knows not the destination of the bust. The visitor might presume that it was intended as a portrait of some member of the Royal Family, although it is characterised by resemblance to no member of it. It is a "pretty" work, and that is all. The second is a most graceful production; on the head is worn a tiara, and the drapery of the bust is a composition of much elegance. No. 1223, 'The Pet Bird, or Killed with Kindness,' E. H. BAILY, R.A., is a small statue of a child caressing a bird to death; and No. 1224, 'The First Thorn in Life,' P. MACDOWELL, R.A., is a group of two children, a boy and girl, the latter extracting a thorn from the foot of the other; the expression of the boy is strikingly natural, and the incident is altogether set forth with impressive truth. No. 1225, 'Sabrina,' H. CARDWELL, has a head too antique for a subject from modern poetry. The distinctions observed by the Greeks themselves should never be forgotten. She has not yet responded to the invocation to listen, but is still braiding her "amber dropping hair," with a disposition of the arms remarkably graceful. No. 1226, 'The Prisoner of Love,' G. FONTANA, is by no means a happy title, nor is the idea felicitously rendered—being realised by a female figure disconsolately seated, having her hands bound with a wreath of flowers: there is some beautiful modelling in the figure. No. 1227, J. S. WESTMACOTT, is a subject from "Lalla Rookh"—

"One morn a Peri at the gate
Of Eden stood disconsolate;"

we have accordingly a figure of the size of life, winged and semi-draped, standing in a *pose* of relief, with the right foot raised, and resting both hands on the thigh; the sentiment is amply and elegantly interpreted. In No. 1228, a 'Statue of a Nymph Surprised,' E. G. PAPWORTH, the lower limbs strike the observer at once as somewhat heavy; the nymph is seated, and the point of the subject is the surprise occasioned by a bird of prey having borne down to her feet a smaller bird, which it has seized. No. 1229, 'Venus and Cupid,' B. E. SPENCE, is a group of much beauty, and a subject in which the artist has felt that he dared not be original, and therefore reminds us of some of the most beautiful statues that remain to us—reliques of the "Rhodian Art." Venus holds up a butterfly, which Cupid is all anxiety to obtain; in the extremities, and in every passage of the figures we recognise the antique. No. 1230, 'Titania,' J. LAWLOR, is a charming work, and pronouncedly an essay in modern poetry; she is active in thought, and the modelling of the limbs is ex-

pressive of the warmth of life. No. 1231, 'A model for a bronze statue of the late Earl of Belfast, erected to his memory by the inhabitants of Belfast, and inaugurated by the Earl of Carlisle, Lord Lieutenant of Ireland, 1855,' P. MACDOWELL, R.A., is an erect figure treated with a loose drapery, but without allusion in anywise to classic form, being disposed with reference rather to modern taste. It is a fine example of pure Art; but as we shall have much to say on the subject ere long (having prepared an engraving of it), we postpone our remarks. No. 1232 is 'Angelica,' from "Ariosto," J. BELL; she is bound to a rock near the sea, to be devoured by a sea-monster, but is delivered by Ruggiero; the subject is dealt with in a manner extremely simple, being interpreted by a nude figure having the hands bound behind. The story of Angelica is not so well known as that of Andromeda; the impersonation will, therefore, most commonly be presumed to represent Andromeda, the daughter of Cassiope, more beautiful than Juno and the Nereids. The same number, with an asterisk, stands against 'Imogen Asleep,' W. C. MARSHALL, R.A.—

"To your protection I commend me, Gods!
From the fairies and the tempters of the night,
Guard me—beseech you."

This is a small figure extended, according to the title, and covered with an elegant arrangement of drapery. It is altogether a chaste and carefully studied work; but in sculpture all recumbent figures have the disadvantage of suggesting monumental designs. It may be said that a difference is markedly maintained, but this is not always the case; any recumbent figure in a holy sanctuary becomes a monument, while the same in a sculpture-gallery is a sleeping figure. No. 1233, 'Queen Boadicea inciting the Britons to avenge the loss of their liberty, and the wrongs inflicted upon her children and herself,' J. THOMAS, is an upright heroic figure, which can be intended to impersonate no other historical character than Boadicea, who is here raising on high her sword, and calling down on the Romans all heavenly and earthly vengeance. Her daughters are intended to assist the narrative, one covering on each side; but these figures are too little seen, and perhaps fall into a *pose* too identical. No. 1234 is a 'Group of Euphrosyne and Cupid,' by E. B. STEPHENS; and No. 1235, 'Charity,' T. AMBUCH, consists of one principal female impersonation, with subordinate infant figures; but in the modelling of the group there is generally much poverty of form. No. 1236, by G. G. ADAMS, is a recumbent figure of a little girl, intended, we may suppose, for a monument, as to the number is appended a quotation of elegiac verses—

"The strife is o'er, death's seal is set
On ashy lip and marble brow;
'Tis o'er, though faintly lingers yet
Upon her cheek a life-like glow."

No. 1238, 'The Youthful Achilles,' H. BANDEL, is the story of his being disguised in female attire among the daughters of Lycomedes. He has put on the helmet, and has taken the shield which Ulysses, in the character of a hawk, had brought for sale. There is some originality in the idea, but the figure is carelessly modelled and badly cast. No. 1239, 'The Skipping Girl, a statue in plaster,' by Mrs. THORNYCROFT, a figure of the size of life, is studied to represent graceful movement, in which it is highly successful; the work looks like a portrait statue. No. 1240, 'Egeria,' J. H. FOLEY, A., is a large figure of much sweetness of character, presented in a *pose* of relief, and conceived rather in the spirit of human charity than of glorified deity. It has been executed in marble for the Corporation of London, to be erected in the Egyptian Hall, in the Mansion House. 'Hermia and Helena,' No. 1241, W. C. MARSHALL, R.A., is a charming subject from the "Midsummer Night's Dream." No. 1245, 'The Model of "Lalage,"' from Horace, J. BELL, is perhaps somewhat difficult of recognition. No. 1247, 'The Milton Vase,' W. J. WILLS, is an admirable subject; the bas-reliefs here are from the sixth and eleventh books, and the narrative pronounces at once the source of the subject-matter. No. 1250, 'Rachel, the daughter of Laban,' J. THOMAS, presents a very elaborate study of drapery; and the accessories of pastoral life assist the spectator to determine the subject. No. 1251, 'The Racket Player,' by J. E. THOMAS, is a nude figure, a study of action sug-

gested by the antique athletes. No. 1255, 'Maidenhood,' J. HANCOCK, is a subject from the verse of Longfellow—

"Standing with reluctant feet
Where the brook and river meet,
Womanhood and childhood fleet," &c.

It is a statue of great refinement of conception, beautifully modelled, though the appearance of the lower limbs through the drapery is scarcely a feature coincident in spirit with the rest of the work. No. 1256, 'Rebekah,' E. DAVIS, is a large life-sized figure, semi-nude, bearing a water-urn on her right shoulder; it is a graceful figure, but the two divisions of the nude and the draped are perhaps too arbitrary. Among the other striking productions may be mentioned No. 1267, 'A Boy Playing with Tali,' W. M. THOMAS; No. 1270, 'Statuette of the Rev. Robert Montgomery,' E. G. PAPWORTH, Sen.; No. 1271, 'Statue of Robin Hood,' Miss S. DURANT; No. 1293, 'Figure in alto-relievo of Miss Helen Faucit,' J. H. FOLEY, A.; No. 1296, 'Marble bust of Lady MacLaine,' F. B. TUSSAUD; 'W. Stuart, Esq.,' E. DAVIS; No. 1307, 'John Propert, Esq.,' J. E. THOMAS; No. 1315, 'Bust of the late Lord de Mauley,' T. CAMPBELL; 'Bust of the late Sir Charles Hulse, Bart.,' J. H. FOLEY, A.; 'Bust of the late Duke of Beaufort,' G. G. ADAMS; 'Bust of Mrs. Wilson,' T. EARLE; 'Bust of a Gentleman,' A. MUNRO; 'Love,' T. WOOLMER; 'George Lance, Esq.,' E. DAVIS; 'Bust of Lieut.-Gen. Sir Colin Campbell,' G. G. ADAMS; 'Marble bust of the late Sir Charles Adam,' 'Bust of the late Lord Truro,' H. WEEKES, A., &c. &c. Thus we find contributions from some of our most eminent sculptors, but their works generally, especially those that are imaginative, are below that standard which has won them the reputation they bear. Again, however, we must say that the light in this room is, we think, reduced by the means taken to diffuse it, inasmuch that but few of the works are really seen: dare we hope in a new sculpture-room that the designs will be so successful, as to obviate all the evils which are now so justly and so bitterly complained of?

THE BRITISH INSTITUTION.

THE collection of "old masters" is this season brilliant and well-conditioned; we have never seen on these walls any collection in more perfect preservation—many of the works have been cleaned, re-varnished, and some perhaps touched upon, but against none can any objection be urged on the score of condition. Here are represented a number of the best galleries in the country—not perhaps by the best works in those collections, because many of these may have been recently seen here; but by productions which, if they afford only an average of quality, declare a vast amount of wealth, a selection from which would furnish forth one of the richest catalogues in Europe. From the Queen's collection there is one picture—one of Wilkie's Spanish subjects, 'The Guerilla taking leave of his Confessor,' as about to enter upon a campaign during the late civil war in Spain. As a pendant to this work, there is another, perhaps also in the Royal Galleries—'The Guerilla's Return,' which shows the same man returning wounded to his home. The picture is executed with that sketchy freedom which distinguishes the manner of all Wilkie's latter works. The Duke d'Aumale contributes two Salvator Rosas and a Guereino. The South Room, as usual, contains examples of our school, with a mixture of older works. Among the former we always look for striking instances of portraiture, and now we find, as heretofore, brilliant works by some of the most eminent of our painters—those who have shared among them the mantles of Antony Vandyck and Diego Velasquez. Over the fireplace in the North Room is a large portrait by RUBENS—'George Villiers, Duke of Buckingham, on Horseback,' with allegorical figures. The duke, mounted on a prancing steed, is en-

* Of the Catalogue a few words. We intended last month to have made an observation on this subject, but in the pressure of other things it was forgotten. To go no farther than the sculpture, when we find such *errata* as No. 1240, 'Igeria,' and a little farther on such Latin as 'Dulce videntem Lalagen,' we may well ask again, as we have inquired before, "if there is nobody in the Academy who can correct a proof of the Catalogue?" We have been working with a first edition of the Catalogue—these and the many other inexcusable errors may have been charitably corrected in subsequent editions: it is, however, altogether inadmissible to say that a first edition of the Academy Catalogue cannot be correct—the Academy are masters of their own occasions, and respond to neither pressure from above nor below; and we submit that if there really be any one who can revise the Catalogue, that it should appear, even its first edition, faultless.

wreathed by cupids and aerial figures in a sea-shore composition; it is throughout, in its qualities and disqualifications, worthy of Rubens. 'The Fish-market,' by DE WITT, is hard in execution and artificial in effect. Near these are two works by VANDERWELDE, which should be pendants, but they belong to different proprietors, Lord Enfield and Lord Derby; they are small, simple pictures, that of the latter nobleman being the preferable. 'An Incantation,' by TENIERS, is a curious piece of witchery in a garland of toadstools and brambles, all admirably studied from Nature, but, we think, with little connoisseurship in fungoids on the part of Teniers. A picture, entitled 'A Boy showing a Trick,' is attributed to LEONARDO DA VINCI, but it is not characterised by his usual feeling in anything. 'St. John,' ANDREA DEL SARTO, is a study of the back of a youth, apparently executed at one sitting. The two JAN STEENS, the property of the Duke of Wellington—'A Wedding Feast,' and 'A Merry-making'—are well-known pictures. The artist will never be a favourite with lovers of the finer qualities of Art. 'A Landscape and Figures,' by BOTH, is evidently a composition, but it is a successful imitation of the way in which Nature herself composes: it is full of light and genial warmth; all the objects, the trees especially, have been studied with the nicest care. Near this is a very remarkable portrait—that of Parmigiano, by himself—brilliant in colour, full of thought and character, and picturesque in attire, almost in too good condition to be of the time of Parmigiano; but he was one, it is true, that worked with the simple indestructible earths, before the chemistry of the Art introduced pigments of transient effect. Another 'Landscape and Figures,' by PYNAKER, is a production of infinite beauty, distinguished by a profitable tone of thought, and a masterly appreciation of the executive material of Art, in so far as it is available in the interpretation of the phenomena of Nature; and near this, yet another 'Landscape and Figures,' in which shine two stars, though of different constellations: these are RUYSDAEL and BERGHEM, the former of whom we recognise, but not the latter, because Berghem's effect is wanting to Berghem's figures; yet it is a picture of rare merit, although too composite in a variety of parts. 'A Dutch Family,' by N. MAAS, is a gem; and the VAN DER HEYDEN—'A View of a Town'—the property of the Duke of Wellington, is a most literal study from a street subject, in which no brick has been forgotten.

In the same room there are, moreover, a number of other pictures, which at once proclaim their high merit:—as 'The Marchese di Savorgnano,' TITIAN; 'A Sea-port,' CLAUDE; 'A Guard-room,' TENIERS; 'Portrait of Paul III.,' TITIAN; 'Hobbima's Village,' by himself; 'The Crucifixion, from the Church of Vittoria, Rome,' GUIDO; 'A Portrait,' by MURILLO; and 'The Temple of Jupiter Panelenius, Island of Ægina—Athens in the distance,' by TURNER, one of those charming works to which Turner gives a feeling more reverentially classic than Claude. Turner qualifies his earthly landscapes for the abode of gods, but Claude disqualifies his deities as the mortal inhabitants of an earthly landscape. This is a magnificent work—one of those of his most intelligible period. In the Middle Room are three VANDYKES—'Penelope, Lady Spencer,' 'William Cavendish, Duke of Newcastle,' and 'Philip Herbert, Earl of Pembroke and Montgomery'—but they are not among his finest works—not to be compared with the Dresden or the Petworth Vandykes. 'The Holy Family,' by GIULIO ROMANO, is evidently a studious essay in colour, very highly wrought, and full of material. There are two SALVATORS, in which the landscapes are very careful,

and the figures unusually imperfect. They are severally entitled—'St. Paul Preaching,' and 'St. Peter taking the Piece of Silver from the Fish's Mouth.' And after these we find three gems hung over the fireplace:—the famous 'Bonnet Rouge' of TENIERS, which it is unnecessary to describe; a 'Head of a Female,' (modest title,) by GREUZE; and a 'Landscape,' by BOTH. The head is from the same model that Greuze worked so much; we find her, accordingly, in various pictures, younger and younger, or older and older, according to the period of the work. The tints here are extremely delicate and varied. The picture by BOTH is a small landscape, charming in airy, broken, and unpositive colour, and most masterly in retiring and unpedantic execution. In this room there are four Canalettos, all the property of Sir J. C. Jervoise—and all in excellent condition. We never look at Canaletto without feeling that he alone, of all painters, has dared to be faithful in his pictures of 'Venice.' We look at his houses and recognise them as habitations; his palaces are not scenic and visionary, but venerable and historical; he looked at Venice through a microscope, others look at her through a telescope. The remnant of the Cartoon of Pisa (so well known from engravings), a drawing by Michael Angelo and Pontormo, is in much better condition than drawings of that period generally are: this drawing is not less curiously muscular than 'The Fall of the Damned.' In this room are many other admirable and valuable works—as 'A Hawking Party,' PAUL POTTER; 'Venus Wounded,' PAGI; 'The Ferry-boat,' BOTH; 'A Concert,' DE HOOGE; 'The Embarkation of Van Tromp,' 'Portrait of himself,' VANDERWERF, &c. In the South Room the visitor will be struck by the excellence of three small pictures by P. NASMYTH; we instance them thus, because those we generally see under this name look like meagre imitations in comparison with these: we commend them to the attention of Pre-Raffaellites. 'Mrs. Gage and Child' is a small life-like study by GAINSBOROUGH, and near it is a picture by COLLINS, 'A view on the Beach near Cromer.' 'Sigismunda,' by HOGARTH, is an essay in the grand style, in which we should have been surprised if the famous ethic painter had succeeded. Two pictures, each respectively called 'Ruins' and 'Figures,' afford good examples of the manner and material of GUARDI; and near these, in 'A Dutch Coast Scene,' by Sir A. W. CALLCOTT, we recognise the expressive power possessed by that artist, in the description of heat and a breadth of hazy light. The portrait of 'Lady Ladd,' by REYNOLDS, will, as years roll on, cause increased wonder that such an extraordinary head-dress ever could have been worn. 'The Crucifixion, with portrait of Martin Luther,' by ALBERT DÜRER, is a small picture in three compartments, very highly wrought; but the drawing is not so satisfactory as that in other works by him. 'Garrick in the character of Richard the Third,' by HOGARTH, is a well-known work—perhaps the best portrait Hogarth ever painted, save always that of himself. Other valuable works here are:—'View in Italy,' WILSON; 'Peasants in a Wood,' MORLAND; 'The Bridge of Rimini,' WILSON; 'Elizabeth, Charlotte, and Horatio Waldegrave, Countess of Waldegrave, Duchess of Grafton, and Lady Hugh Seymour,' a group of life-sized figures, by REYNOLDS; portrait of 'Miss Hunter,' by the same; 'Landscape with Sheep,' GAINSBOROUGH, &c. The collection abounds with small works of much excellence, and, indeed, with many gallery-pictures of high character. Year after year may the enthusiast visit this collection with ever increasing admiration at the exhaustless stores of pictorial wealth which annually adorn these walls with examples of Art so captivating.

ART IN CONTINENTAL STATES.

PARIS.—Death has recently deprived France of two artists—Jazet, the engraver, and Ducornet, the painter, an obituary notice of whom appears in our present number. Jazet was aged only 40; his principal works are:—"The Slave-market," after Horace Vernet; "Edward's Children separated from their Mother," after Gosse, for which he gained a gold medal in 1842; "Galileo at Florence," after Gosse, and two subjects after Schopin, from the tale of "Paul and Virginia."—It has been decided that a monument shall be erected at Rheims to the memory of Colbert, the celebrated minister of Louis XIV., that town being his birth-place. The committee is presided over by M. A. Fould: the monument will take the form of a statue; the artist to be decided by public competition.—In the street "Quincampoix," on demolishing an old house, four paintings were recently discovered; an amateur passing by bought them for a few francs; this fortunate person is now in possession of two beautiful paintings by Chardin, and two by Oudry.—M. Lazerges has just finished a chapel of great merit at the Church of St. Eustache; it is dedicated to St. Anne.—The Gallery of the Luxembourg, lately shut for repairs, is again open, with several additional paintings.—A fine female statue has been discovered near Cherchell, which has been placed in the Museum; it is six feet in height.—Letters from Bagdad state that the splendid sculptures sunk in the Tigris by the Arabs have been recovered; they were excavated at Nineveh by M. Place. Nerroud-Bey, aide-de-camp to the Governor of Bagdad, directed the work for their recovery with great intelligence: we are in hope of soon seeing them in Paris.—The Emperor has visited the Louvre, in which are soon to be installed the different individuals who are to reside there; several fresh rooms are to be appropriated to various departments of Art, there being still an immense quantity of paintings, sculptures, &c., in the warehouses, stowed away, which are to be brought to light.—The Louvre has just made a most valuable acquisition in a manuscript volume in folio, filled with sketches by Leonardo da Vinci. It has been purchased from M. Villardi, of Milan, for the sum of 35,000 francs, or £1400 sterling. It is a well-known fact that, in 1797, thirteen manuscript volumes of Leonardo were transferred from Milan to Paris; one of these, which had been deposited in the Bibliothèque Impériale, was restored by the allies in 1815. The other twelve are still in the Bibliothèque de l'Institut.—The Italian review, *Arti del Disegno*, notes the recent discovery of a little picture by Michael Angelo, differing from that from which, it would seem, Bonasconi, Beatrice, Cavalleris, Rota, and Landon, have given engravings. This little canvas represents Christ dead, on the knees of his mother, who lifts her head and arms to heaven, she being sustained under the arms by two angels.—A bust of the composer Lesueur has been placed in the Gallery of the *Académie Impériale de Musique*, by order of M. A. Fould.—A statuette has lately been discovered at Antwerp, representing Salvius Brabo holding the mutilated hand of the giant of Antwerp, and treading on a warlike instrument; this statuette, marvellous in execution, is attributed to Quentin Matsys; it was found in a garret of the *Hotel de Ville*; it is of iron, gilt.—The demolition of old Paris continues on a large scale; at the *Hotel de Cluny* large portions of the *Palais des Thermes*, built by the Emperor Julian, have been brought to light, having been hitherto shut out by the houses of the *Rue de la Harpe*; it is said they will be preserved "en place," and a garden formed, surrounding one side of the *Hotel de Cluny*.—The "Hemicycle," by Paul Delaroche, which was damaged by fire, has been successfully restored.—An exhibition is announced to take place at Amsterdam, to be opened on the 9th of September; all pictures, &c., sent must arrive by the 25th of August next.—On dit, an "Arc de Triomphe" will be erected in honour of the campaign of the Crimea.—The Emperor has ordered of Horace Vernet the portraits of Marshals Bosquet and Canrobert for Versailles.—At the *Hotel Drouot* was recently sold a Cyp, "Interior of a Stable," for 14,000 francs.—A gallery of a Roman prince has also been disposed of in Paris; when a "Diana Hunting," by Vandyck and Sneyders, sold for 4500 francs; "Virgin and Child," Maechiavelli, 5500

franes; "Zingarella," Correggio, 10,200 franes; "Virgin and Child," Ghirlandajo, 1700 franes; "Portrait of Taddeo Taddei," by Raphael, 14,000 franes. These three last were part of the Gallerie Giustiniani.

LYONS.—*A Museum of Lace.*—What, as we stated in a previous number, a public body is about to effect for Lyons, a spirited individual, M. Theodore Falcon, has undertaken to do in respect to lace, for his native place, the little town of Puy; wherein, it appears that, as a manufacturer of that delicate article, he has acquired an independence. It need not be remarked that an extremely interesting and various collection of specimens of that most ancient and elegant tissue can be brought together. At Honiton, or Limerick, it may not be known that St. Francis-Regis of the Roman Calendar is to lace, what St. Crispin is to the less refined pursuit of shoemaking—viz., its patron. M. Falcon meditates, it seems, erecting in his museum a statue of the said saint, representing him at the moment when, in the year 1629, he cheered the hearts of the lace-workers of Puy, depressed and full of apprehension in consequence of certain sumptuary laws just enacted, and exclaimed to them, "*Ayez confiance en Dieu, la dentelle ne perira jamais.*"

OBITUARY.

LOUIS-CESAR-JOSEPH DUCORNET.

This artist was born at Lille, the 10th of January, 1806, and was one of a large family in poor circumstances. Nature had made him the subject of sad bodily deformity, for he was born without arms or thighs; he had only four toes to his right foot, which otherwise was admirably formed. Until the age of six he was weakly, and could with difficulty support himself; this state was probably the means of developing his talent as an artist. The rest of the family being busy in their daily occupations, young Ducornet was left to roll about on the floor, and thus acquired the habit of picking up bits of charcoal from the hearth, and amusing himself in drawing on the wall all the objects that presented themselves to his eye. In the same house dwelt the nephew of M. Wateau, professor of drawing at the school, whose children were in the habit of playing with young Ducornet. One day they requested their father to show him how to draw a flower, who answered that he would teach him the principles of drawing, on condition that M. Ducornet should also teach him to read and write; the proposition was accepted, and Ducornet continued to work with the children of Wateau. The Mayor of Lille, the Count de Mynssard, seeing the rapid and intelligent progress of the child, obtained for him a pension of 300 franes from the municipality. Some time after, M. Pottean, deputy of the department, with the assistance of M. de Mynssard, caused him to be sent to Paris, and placed in the atelier of Lethière, where he was treated by that painter as a son, and by the pupils as a brother. Through the intervention of Baron Gerard, Charles X. assigned him a pension of 1200 franes per annum, which was paid him until the downfall of that monarch in 1830: it was never renewed, notwithstanding Baron Gros interested himself greatly to obtain it.

Before 1830, he painted the "Parting of Hector and Andromache," also several portraits. At Cambridge he gained a bronze medal for his picture of "Repentance;" in 1840, a gold medal, 3rd class, for the "Death of Mary Magdalen;" in 1841, one of the 2nd class in gold, for the "Repose in Egypt;" and in 1845, a gold medal, 1st class, for "Christ in the Sepulchre." In 1855, he exhibited his last painting, "Edith," a commission from the Emperor: these paintings were all large life-size. He also gained several medals in various provincial exhibitions. This artist presents an interesting proof of what may be accomplished by perseverance and study, with even limited powers. Ducornet died in the arms of his venerable father, who never deserted his darling boy; he is now left in poverty in his old age. At the Paris Exhibition might frequently have been seen the extraordinary spectacle of a poor aged man, with a short middle-aged one on his back, mounting slowly the long and steep flight of stone steps of the *Palais des Beaux Arts*—this interesting group was Ducornet and his father. A sale is being organised of the paintings left by Ducornet; let us hope that the biddings will be sufficiently liberal to enable the survivor to end his days in peace and comfort.

PAUL AND VIRGINIA.

FROM THE GROUP BY W. C. MARSHALL, R.A.

THE sculptor of this group has chosen a subject which must have severely tested his powers of conception, if we examine it by those principles which are presumed to regulate the rules of Sculpture. Thus, for example, the arrangement of the figures throws the whole *weight and substance* of the composition into the upper half; the result is that when viewed from the point presented in the engraving, the work has the appearance of being what is commonly called "top-heavy"—a defect, if we may so term it, that might have been obviated by the introduction of a mass of rock, or something of the sort, at the base to act as a counterpoise. The stump of the palm-tree placed there merely to support the weight of the figures is not sufficient to restore the balance which the eye requires to remove from the mind the sense of insecurity, and to produce an impression of general harmony of the parts.

On the other hand, it must be admitted that Mr. Marshall has succeeded in overcoming a very difficult task in representing two figures thus circumstanced: they are of nearly equal size; and, ordinarily, the act of one person carrying another in his arms has an awkward, if not a ludicrous, appearance; but by a skilful arrangement of the upper limbs, and a judicious disposition of the heads, the group, in the upper division, becomes a graceful object. The sculptor has carefully avoided all sharp angular lines, not very easy to do when we consider the action of the figures. The work is not a recent production of the sculptor; it was exhibited at the Academy as far back as 1845, the year after Mr. Marshall had been elected associate.

We apprehend that few of our readers have read, since their school days, the charming little tale of Bernardin de St. Pierre; it may, therefore, be necessary to refresh their memories with the incident which forms the subject of Mr. Marshall's sculptured group. Paul and Virginia, returning from their mission on behalf of the runaway negress, contrived to lose themselves, and wander about till they come to a river, which threatened to arrest their onward progress. "The noise of the waters alarmed Virginia, and she was afraid to wade through them; Paul then took her on his back,"—the sculptor has very rightly placed her in the arms of her young companion, instead of following the inelegant mode of transport indicated in the text,—and passed thus loaded over the slippery rocks which formed the bed of the river, regardless of the tumult of its waters. "Do not be afraid," he cried to her, "I feel very strong with you." The features of the two forcibly indicate their respective feelings—the apprehensions of the girl and the bold encouraging words of Paul—the head of the latter is admirably modelled; so, indeed, is that of Virginia, but there is something in the expression of the mouth which is not quite agreeable: it is so long since we saw the original that we cannot determine whether the defect rests with the sculptor, or whether it is to be attributed to the way in which the shadows fell on the face when our artist made the drawing from it; we rather suspect the latter to be the cause, and that, therefore, he could not remedy what appears a fault without violating the laws of light and shade.

To those who can see no beauty in Sculpture, save that which is after the similitude of the ancients, works of such a character as this must appear "flat, stale, and unprofitable," yet in reality they are not so, though we must allow this especial subject is better adapted for the painter's art than the sculptor's. To us, whose duty it is to mark everything that issues from the studio of the latter, almost any change is a relief: we are wearied with Cupids, and Venuses, and Psyche, and Musidoras, *et hoc genus omne*, and are glad sometimes to pass the boundary of the land of fiction, and find ourselves in that of fact, or of that which seems to approach to it. Moreover, subjects that belong to the class we may term "domestic," ought never to be considered puerile, or beneath the notice of an artist of genius: he cannot go far wrong who addresses us in a language we understand, and in a manner with which our common feelings and sympathies are in some degree in unison.

THE ART-UNION OF LONDON.

THE following pictures have been selected by the prize-holders of the current year up to the time of our going to press. The initial letters after the names of the artists indicate the respective exhibitions out of which the works were chosen.

'Old Bridge in Pella,' G. E. Hering, 200*l.*, B. I.; 'Shades of Autumn,' A. W. Williams, 150*l.*, N. I.; 'The Mid-day Meal,' H. B. Willis, 100*l.*, N. I.; 'Hotel de Ville,' W. Callow, 73*l.* 10*s.*, W. C. S.; 'Oyster Dredging,' E. Duncan, 105*l.*, W. C. S.; 'Cochem on the Moselle,' V. Cole, 75*l.*, S. B. A.; 'View in Dove Dale,' J. C. Ward, 80*l.*, S. B. A.; 'Scene from the "Gentle Shepherd,"' W. Underhill, 60*l.*, B. I.; 'Early Morning,' H. B. Willis, 60*l.*, N. I.; 'Medmenham Abbey,' H. J. Boddington, 60*l.*, S. B. A.; 'Youthful Gamesters,' T. Clater, 60*l.*, S. B. A.; 'A Summer's Morning,' H. J. Boddington, 60*l.*, S. B. A.; 'A Group of Wild Flowers,' Mrs. Withers, 50*l.*, N. I.; 'Landscape with Sheep and Figures,' G. Cole, 50*l.*, R. A.; 'Dutch Vessels entering Lillo,' T. S. Robins, 50*l.*, N. I.; 'On the Conway,' J. C. Ward, 50*l.*, S. B. A.; 'Holy Island,' W. H. Paton, 50*l.*, R. S. A.; 'A Welsh Fireside,' D. W. Deane, 50*l.*, R. A.; 'Landscape with Cattle,' J. E. Meadows, 40*l.*, S. B. A.; 'The First Buttons,' D. H. Friston, 30*l.*, R. A.; 'A Somersetshire Lane,' G. Fripp, 47*l.* 5*s.*, W. C. S.; 'An English Lane,' H. J. Boddington, 40*l.*, S. B. A.; 'The Pilgrimage Church of Bethanay,' A. F. Rolfe, 35*l.*, S. B. A.; 'Homestead,' C. Davidson, 40*l.*, W. C. S.; 'Thames Tow-boat,' W. S. Rose, 35*l.*, N. I.; 'The Woodman's Repast,' H. P. Parker, 40*l.*, N. I.; 'Ruse de Guerre,' T. M. Joy, 35*l.*, B. I.; 'Scene near In-y-sy-buth,' J. Tennant, 50*l.*, S. B. A.; 'Goat Fell, Isle of Arran,' G. Cole, 36*l.*, S. B. A.; 'Summer Shade,' E. G. Warren, 25*l.*, N. W. C.; 'Yorkshire Farm-house Kitchen,' E. Cockburn, 21*l.*, S. B. A.; 'Way-side Inn,' R. Brandard, 25*l.*, B. I.; 'View in Barmouth,' A. Clint, 25*l.*, S. B. A.; 'The Mumbles, in Swansea,' G. Wolfe, 25*l.*, S. B. A.; 'Gipsies in a Wood,' J. E. Meadows, 35*l.*, N. I.; 'All Saints' Church, Hastings,' C. Davidson, 25*l.*, W. C. S.; 'Surrey Scenery,' W. Lukeing, 25*l.*, N. I.; 'Rain, Coast of Boulogne,' J. J. Jenkins, 26*l.* 5*s.*, W. C. S.; 'On the Look-out,' J. Henzell, 25*l.*, S. B. A.; 'Welsh Ford,' G. Shalders, 25*l.*, S. B. A.; 'A Ferry-boat, Loch Leven,' W. Luker, 26*l.* 5*s.*, R. A.; 'Vegetable-market, Venice,' J. H. Degville, 26*l.* 5*s.*, N. W. C. S.; 'A Weary Journey,' C. Dukes, 25*l.*, R. A.; 'Old Gateway, Guernsey,' J. P. Naftel, 25*l.*, W. C. S.; 'A Forest Stream, Evening,' E. Gill, 30*l.*, R. A.; 'A River Bit, North Wales,' J. Dearnley, 25*l.*, B. I.; 'Afternoon,' A. J. Stark, 25*l.*, S. B. A.; 'Laura,' T. M. B. Marshall, 25*l.*, R. A.; 'Head of Loch Lomond,' P. C. Auld, 30*l.*, S. B. A.; 'Dutch Vessel beating out of Harbour,' E. Hayes, 20*l.*, N. I.; 'A Beech Grove,' F. O. Finch, 20*l.*, W. C. S.; 'The First Scrape,' R. Farrier, 20*l.*, R. A.; 'The Evening Gun at Colne,' J. P. Naftel, 25*l.*, W. C. S.; 'Surrey Cott Scenery,' J. J. Wilson, 20*l.*, R. A.; 'A Water-Mill, Dolgelly,' A. Barland, 20*l.*, S. B. A.; 'Goldfinch, and other Singing Birds,' Mrs. Withers, 20*l.*, S. B. A.; 'Ronen,' A. Montague, 20*l.*, N. I.; 'A Farm Pond,' J. Stark, 20*l.*, B. I.; 'Highland Courtship,' Jessie Macleod, 25*l.*, S. B. A.; 'Trellis Vine,' W. W. Fenn, 20*l.*, R. A.; 'The Last Gleam in the West,' H. B. Gray, 20*l.*, N. I.; 'Roman Peasant Girl,' T. Godderson, 20*l.*, B. I.; 'Fresh Breeze,' J. Meadows, 20*l.*, S. B. A.; 'Favourite Retreat, North Wales,' F. W. Hulme, 20*l.*, R. A.; 'Distant View of Edinburgh,' J. Callow, 21*l.*, W. C. S.; 'Turf Boats,' M. A. Hayes, 21*l.*, N. W. C. S.; 'Dunkirk,' A. Herbert, 30*l.*, R. A.; 'Fresh from the Garden,' O. Oakley, 21*l.*, W. C. S.

ART IN THE PROVINCES.

STOKE-UPON-TRENT.—The committee appointed to promote the erection of baths and washhouses in Stoke-upon-Trent, towards which Mr. H. Minton lately offered £500, have unanimously resolved, "That his recent liberal offer of the sum of £500, towards the erection of public baths in this town, affords a desirable opportunity for giving public expression to the regard generally entertained throughout the country for his public and private character." The project (according to the *Stafford Advertiser*) is to erect a public building by subscription, which shall adjoin the baths, and be appropriated to the advancement of Art and Literature, particularly amongst the young, and with which Mr. Minton's name is to be associated in perpetuity. Few gentlemen have deserved better of his neighbours than Mr. Minton; he has been foremost in every good work in the district for which, as a

PAUL AND VIRGINIA.

ENGRAVED BY F. ROFFE FROM THE GROUP BY W. C. MARSHALL R.A.

manufacturer, he has done so much. But his useful labours have been far more widely extended: he has elevated the repute of British porcelain in all parts of the world, and so increased the trade in one of the most important of the Art-productions of his country. Although the Potteries are more directly interested in this "Testimonial," there is no reason why it should be limited to them, and we hope it will not be so.

GLASGOW.—The town-council of Glasgow recently had a long debate on the propriety of purchasing the "M'Lellan Gallery," described in the *Art-Journal* of December last. We had understood that the late Mr. M'Lellan had presented his pictures, and the edifice he caused to be built for their reception, to the citizens of Glasgow, and we so stated; but it seems, from the discussion referred to, that a sum of above £40,000 will have to be paid for their acquisition. A motion was made, that "the purchase of the property, on the terms proposed, be not agreed to;" to which the Lord-Provost proposed an amendment, that the "Council take over the buildings and pictures at the price of £44,500," which was agreed to on a division, by a majority of five; forty-three councillors being present, and voting. Some curious remarks were made, during the discussion, on the state and quality of the pictures: one speaker objecting to the purchase on the ground that the collection contained too many representations of the nude figure; another said that Mr. M'Lellan himself used to attempt to improve the paintings by touching them; and that the first thing the council must do, if the purchase were effected, would be to "bring them back to their pristine state." Another connoisseur remarked, "that he never saw anywhere such a large collection of rubbish in the shape of paintings as was to be seen in this gallery." The majority, however, were of a different opinion, and testified it by their votes.

ROYSTON.—The small town of Royston, in Hertfordshire, which contains a population of not more than 2000 persons, now has its Institute, devoted to literary, scientific, and educational purposes, with a Museum—comprising more than nine hundred specimens of artistic and scientific objects—library, reading-rooms, class-rooms, and a spacious lecture-hall. At the inauguration of the building, which has just been completed, Mr. Robert Hunt, F.R.S., delivered a lecture on the purposes to which the edifice is devoted, and on the general character of the contents of the museum. The number of subscribers to the Institute, paying for the privilege of attending it, is already 240, or about one-eighth of the entire population.

MINOR TOPICS OF THE MONTH.

THE NATIONAL GALLERY OF PORTRAITURE.—Parliament has granted £2000 as its first annual contribution to a National Gallery of Portraiture; so far the wise and patriotic recommendation of the Earl of Stanhope has been carried out. The work is at all events commenced; although the sum is so small, it was not given without a murmur: the objections urged might have been urged against any project by which the people are to be enlightened and encouraged—against any tax that was to pay a thousandfold, by removing from the future the national reproach we have had to endure in the present and the past. If "history is biography teaching by example," there can be no teachers like the portraits of great and good men, who have been public benefactors. Nelson is not the only hero whose incitement to victory was a niche in Westminster Abbey; and who shall say what heroism of intellect may not be stirred into action by the prospect of a place among British worthies in this gallery? It will be at once a stimulus and a reward. Some apprehension was expressed lest the collection might be sectarian and not catholic. We know that a narrow and shallow prejudice kept the statue of Cromwell from the Palace, and Byron from the Abbey, at Westminster; but we cannot dread the influence of so poor a spirit in forming a collection that will be so emphatically the property of the people. Probably the first effort to familiarise the public with this valuable novelty will be to borrow from various sources authentic portraits, and exhibit them at Kensington—a more graceful inauguration of the new building could scarcely be desired. It would then be seen what works it might be most advisable to copy; for many years must elapse before a collection could be formed by purchase or bequests.

Original portraits are for the most part heirlooms in families, and can rarely be obtained; nevertheless, in time many acquisitions may be looked for. The sum to be expended is small; but judiciously expended on good copies it will go a long way—perhaps so far as to obtain thirty or forty portraits in a year, and these of the best order; so good, indeed, that the ordinary eye shall not be able to distinguish them from the original. The government has done well and wisely by urging and sustaining this movement; it is another step in the right direction for the intellectual advancement of the people, and we congratulate the estimable president of the Society of Antiquaries on this result of his patriotic labours.

THE SCUTARI MONUMENT.—We blush to write it—Parliament has passed a grant of £17,500 for the abortive attempt of M. Marochetti to record the triumphs and the losses of the British army in the East. "A portion of the monument" was sent off before the sun was granted; government having, it appears, safely calculated upon removing all objections to the work and the amount. Mr. Bowyer, indeed, in his simplicity wished to know, "before the committee agreed to the vote, what the monument was to be, what artist was to be employed, and how it happened that so large an amount was required,"—as if all these things had not been settled long ago, and the country had to do any more than pay the money. Lord Palmerston, in reply, described the monument as "of extreme beauty," which would, he was sure, be "the admiration of all who saw it." We presume to differ entirely from his lordship, and venture to assert that nine out of ten who see it will consider it only as a work of Art of inferior character, meagre in design and weak in execution. But that is not the main point at issue—there are half a dozen great sculptors (unhappily for them *British* sculptors) who would have produced this monument for less than one half the amount which the British people have paid for it; we do not hesitate to name them—Baily, Foley, MacDowell, Bell, Calder Marshall, Behnes,—reference may be made to either of all of these for confirmation of this fact: and in estimating the work at less than one half of £17,500, we include the cost of its transfer to Scutari, and its erection there. Any protest against this discreditable "commission" is now useless; with the support of the Government and the all-powerful aid of the *Times* newspaper, Baron Marochetti may laugh at any efforts to obtain for British Sculptors a share of the honours and emoluments he is destined to receive from the British people; but in the name of the public and the profession, we protest against patronage entirely uncalled for and unmerited, and which acts as "a heavy blow and great discouragement" to prejudice an Art in which our artists surpass those of any other country, but which requires especial sustenance at the hands of the nation, in order to remove the difficulties which must always stand in the way of its prosperity. We say again, there is no honest man in Great Britain, if he do his duty, who will not raise his voice against this act of gross injustice and absolute treachery.

THE ILLUMINATIONS.—Unhappily upon this subject we have very little to say: the resources of Art seem to have contributed nothing to the memorable 29th of May—if we except the colours with which professors of pyrotechny so lavishly filled the atmosphere. The streets were indeed abundantly garnished with crowns, stars, and letters V, R, and N. E.; but instances in which thought was exercised, and taste had laboured, were extremely rare. "Stars of gas," and "stars of lamps," might have been counted by hundreds; and there can be no doubt that a very large sum of money was expended on "orders" to purveyors to make "something that would do;" we looked in vain, however, for a solitary sign of originality, elegance, or appropriate grace. The result is certainly humiliating, and says less than nothing for the advancing progress of the age. There are but two examples which call for especial comment—the illumination at the National Gallery, and that at the Board of Trade in Whitehall. The public had a right to expect that some evidence of proceedings within should have been indicated without. In the former, the exhibition of the Royal Academy was at its zenith: our best artists are members thereof; and might have been called to council by the trustees; all they could do, however, or all they did do, was to put up a monstrous black board, with holes in it, through which holes were seen a couple of stars, a crescent,

a couple of crowns, letters V. A. and letters N. E., and a couple of laurel branches, not forgetting the name of the designer—some one at "Houndsditch"—which figured in illuminated letters a foot long in the corner. It was a display that might have been creditable to Madame Tussaud—but was to the last degree deplorable as the contribution of our National Gallery and Royal Academy, in combination, to tender homage to the great festival of a nation. The "show" at the Board of Trade was worse: this Board has the direction of the Government School of Art, and the masters thereof are at its beck and command. All that could be accomplished here was to put up seven gigantic letters—the word PEACE, with the letter V. before, and the letter N. at the end: these seven letters being linked together by a huge red cable, from which issued blue bands, to which the letters were suspended—the A., as a centre, having leaped a few feet above the rest. Both instances were proofs of low judgment and wretched taste; and may supply sufficient apologies for shortcomings everywhere. A glorious opportunity has thus been lost: surely the Royal Academy should have come to the rescue; and as surely the Board of Trade might have shown what its staff of Art-teachers and Art-students could do at Marlborough House. Verily, "they manage these things better in France." In Belgium, and in any of the German states, such an occasion would have been eagerly seized upon to give lessons in Art, and "the people" would not only have been delighted but instructed. Here it has been worse than lost. No one of the hundreds of thousands who walked the streets of London on the 29th of May went home a whit more enlightened, or with an iota more of veneration for, or love of, Art.

A GALLERY OF PICTURES has been formed at the CRYSTAL PALACE. The idea was suggested some three or four years ago: it has now been carried out; and, although of a character by no means satisfactory, it will be readily understood that many difficulties—some of them insurmountable—had to be encountered. On the whole, perhaps, the exhibition is as good as was to be expected; but another year may see, and ought to see, one much better. The Directors will do wisely to intrust this delicate task to one of their own body, in whom the artists may have confidence, giving due notice of their intention; for it will not do to make up a collection out of the "rejected" of the Royal Academy, and the "hang-on-hand" works of dealers, such as we now see in the Gallery at Sydenham. The principal object of the exhibition is, however, to accomplish sales; and it very rarely happens that artists of eminence have pictures unsold; consequently, to render the exhibition attractive, there must be a mixture of borrowed works; such is the case at present; there are two paintings—one by Sir Edwin Landseer and one by De Keyser—lent by the King of the Belgians; and scattered about we observe other loans, such as the "Charbonnier" of Rosa Bonheur. By far the majority of the collection consists of importations from France, Belgium, and Germany; a few of these are of value, but nine out of ten will find neither admirers nor purchasers; while the specimens of our English School, with a few exceptions, do little credit to it, and rather confirm the verdict of the Royal Academy hangers than justify a protest against their fiat. Anything painted and in a frame seems to have been welcomed by the collector, come whence or from whom it may; consequently, there is an immense mass of rubbish, making up a large assemblage, indeed, but which requires to be abundantly weeded to give pleasure or to do good. Still the exhibition, inferior as it is, adds another to the many intellectual enjoyments supplied by the Crystal Palace.

THE ROYAL ACADEMY.—It has been observed with no little indignation, that Mr. RICHARD COOK continues to be a member of the Royal Academy, although another year has passed and no work of his has been seen upon its walls. We perceive the word "Trustee" is appended to his name in the catalogue—what this word means we cannot say; but if we are rightly informed, not only months but years have gone by since he has attended even a business meeting of the members—contributing just as much to their official labours as he does to their annual exhibitions. There is but one word for conduct such as this—and that word we do not care to use. Year after year this "member of the

Royal Academy" keeps out of that body an artist of industry and genius who would be a credit to it, and to whom the distinction would be of value. If the Academy have no power to prevent this outrage, it is to their discredit that they do not obtain a remedy:

"He who upholds oppression shares the crime."

THE WOOD-CARVINGS IN ST. PAUL'S CATHEDRAL.—The attention of those interested in the preservation of the fine wood-carvings by Grinling Gibbons having been directed to those executed by him in the Cathedral of St. Paul, Mr. Rogers, whose name is so intimately identified with this Art, has, by the courtesy of Archdeacon Hale, made a close examination in order to ascertain their present condition. We believe the substance of his report to be this:—Taking first the outside of the choir, which is enriched with garlands of flowers and palms, he found that these have been so patched and mended at different times that the original intention can only be made out by the marks left on the wainscot ground; and even these have been disfigured by black dirt being rubbed into the grain of the wood, which has rendered them rather unsightly objects than agreeable architectural ornaments. Examining next the inside of the choir, Mr. Rogers ascertained that the lower tier of lime-tree carvings has white mildew in all the diaper cuttings. On looking down upon the sculptured work from the upper gallery, he found it covered with a black dirt a quarter of an inch thick, which the damp atmosphere is forcing into the open grain, and under this mass of dirt is the white mildew. The same may be said of the canopied stalls, the bishop's throne, and the enrichments of the organ; in fact, the whole of these beautiful works are rapidly perishing, and in a comparatively few years will crumble into dust unless means be taken for their preservation. The success which has attended Mr. Rogers' restoration of the carvings at Belton,—a report of which we published two or three months ago,—will, we trust, induce the Dean and Chapter of St. Paul's to entrust him with the task of repairing the Gibbon work in their cathedral. We understand he has formed a plan by which this may be effected without interfering with the daily use of the choir.

SALE OF DRAWINGS BY TURNER.—Ten small drawings by Turner were sold by Messrs. Foster and Son, on the 7th of June, at their rooms in Pall Mall; they were the property of Mr. J. Dillon, of Croydon, and realised nearly £1600. "Mount St. Bernard" realised 45 guineas; "The Pyramids of Egypt," engraved in Finden's "Illustrations of the Bible," 87 guineas; "Nazareth," engraved in the same, 126 guineas; "Old London Bridge," engraved by Goodall, 235 guineas; "Junction of the Greta and Tees," engraved in Turner's "Yorkshire," 190 guineas; "Florence," engraved in Hakewell's "Italy," 100 guineas; "Plymouth," engraved by Lupton, 115 guineas; "Saumur," 195 guineas, and "Nantes," 170 guineas, both engraved in the "Keepsake;" and "Llanrwst, Conway," formerly in the possession of Sir John Pilkington, 260 guineas. A set of early proofs of Turner's "England and Wales," with the etchings and intermediate proofs, was sold at the same time for 150 guineas.

THE NEW NATIONAL GALLERY.—A bill prepared by the Chancellor of the Exchequer and Mr. Wilson provides a site for a National Gallery, and after a lengthy preamble empowers the lords of the treasury to select and mark out such part of the land purchased by the exhibition commissioners, at Kensington Gore, as may appear suitable for the purpose of the site of a new National Gallery, with proper surrounding or adjoining space and approaches. This arrangement may then be considered final; and although there are strong objections to the site, perhaps objections equally strong might be urged against any other. We trust the building, when erected, will be worthy to contain the Art-treasures of the nation. Probably it will be the privilege of the next generation to witness the removal of the pictures; for Parliament, always reluctant to grant money for Art-purposes, will scarcely be induced to give a sufficiency except by slow instalments. We presume the present building in Trafalgar Square will then be given up to the Royal Academy; but we trust, whenever this is done, arrangements will be made for a wiser regulation of that body, and a government more commensurate with the spirit of the age and the requirements of the profession.

THE FOXLEY COLLECTION OF PICTURES, belonging to Sir Charles Price, was sold by Messrs. Foster and Son last month; the most important works among them were:—a small equestrian portrait of the Duc d'Olivarez, by Velasquez, which realised 240 guineas; a companion picture, an equestrian portrait of the brother of Philip IV. of Spain, 176 guineas; and "The Battle between Alexander and Porus," by N. Berghem, 235 guineas. The entire collection, upwards of fifty lots, only realised about £1000.

THE GENERALS IN TENT AT BALAKLAVA.—A work of great interest and considerable merit—painted by A. Egg, A.R.A.—is now exhibiting at No. 6, Pall Mall; it is based on the photograph with which the public are familiar, and which represents the Generals Raglan, Pelissier, and Omar Pasha, in consultation. The picture is very carefully and very admirably wrought; the likenesses are of acknowledged excellence; and altogether few works are better calculated to make an effective print—a print which cannot fail to be acceptable as preserving portraits of the moving and guiding spirits of the war, whose names must be ever famous in history.

THE ALLIED GENERALS BEFORE SEBASTOPOL is another result of the war: a picture of very remarkable talent, and of the highest possible interest, has been painted by Mr. T. Jones Barker, to whose merits we have often referred, and especially in a late notice, which directed attention to his picture of "Napoleon on the Field at Bassano." The allied generals at Sebastopol are but the centres of groups—groups which represent no fewer than eighty of the more remarkable officers of both armies: the likenesses have been generally made from the photographs of Mr. R. Fenton, but many of the heroes have given sittings to the artist, and the result is an assemblage of portraits singularly faithful. The picture is of the very highest excellence—it is not too much to say there is no living painter who could have produced a better; each of the persons represented is distinctly portrayed, while there is no confusion, nor any undue pressing forward; it is a collection of portraits (and here is the chief object); but it is a picture admirably composed, in perfect harmony, and of very great interest, considered merely as "a subject." It cannot fail to elevate the character of the artist, who, in triumphing over many obvious difficulties, has given evidence of abilities of a remarkable order. It is to be consigned to the skilful and able hands of Mr. C. Lewis for engraving, and is meanwhile exhibiting at the German Gallery, Bond Street. We regret that our space will not permit us to accord sufficient justice to this very interesting and attractive work.

STATUES OF BURKE AND CURRAN have been ordered by the Government for St. Stephen's Hall, at the cost of £7000 each. Mr. Theed is commissioned to execute that of Burke, and Mr. Carew the other. Thus the authorities are proceeding by slow degrees in the work of perpetuating the "forms and linaments" of our great men: hitherto the selection has been made with judgment.

TESTIMONIAL TO MR. GEORGE GODWIN, F.R.S.—In our remarks on the stage-improvements introduced at the Princess's Theatre, we had occasion to remark on the valuable assistance Mr. Kean had received from Mr. Godwin—not only with regard to the "Winter's Tale," but to other plays of Shakspeare, which have been produced, not merely as acted dramas, but as practical lectures on pure Art—to instruct while they amuse, and to teach the most valuable of all lessons—truth. Mr. Kean obtained the best assistance: calling in the aid of those whose help could not have been purchased, but who, partly from respect to him, and partly from a desire to see the stage devoted to its high purpose of "educating," ably seconded the efforts of the liberal and intelligent manager. Among these, Mr. George Godwin was indefatigable in his exertions:—no one was better able to give assistance, and no one could have rendered it with better effect. In order to mark his sense of these services, Mr. Kean has presented to Mr. Godwin an elegantly designed CLARET JUG, in silver, bearing the following inscription:—

"To George Godwin, F.R.S., from Charles Kean, as a slight token of the high appreciation entertained for valuable assistance in Architectural Details, while carrying out the design of placing before the public correct Historical Illustrations of 'Macbeth,' 'Henry VIII.,' and the 'Winter's Tale,' produced in the years 1853, 1855,

1856, at the Royal Princess's Theatre, under Mr. Charles Kean's management.—May, 1856."

THE ROYAL SOCIETY is, it appears, to be located at Burlington House, giving up its present rooms in Somerset House; it has been resolved:—"That the council be authorised to accept and carry out the proposal of the government as to the occupation of Burlington House, on the understanding that the hall, which it is proposed to construct in the west wing, and which is to contain the portraits belonging to the Royal Society, shall be placed in the custody of the Royal Society, subject to the free use of it by the senate of the University of London at all times at which it may be required for their examinations and public meetings." The library of the Royal Society now comprises 45,000 volumes. The Linnæan Society and the Chemical Society will also have accommodation given to them in Burlington House; and we presume in course of time the Society of Antiquaries will follow.

SOMERSET HOUSE.—The new wing of Somerset House, in Wellington Street, Waterloo Bridge, is rapidly approaching completion; within a very short time we may expect to see the scaffolding removed. The architecture is in strict harmony with the more ancient portion of the edifice; and when the new part is finished it will not only be a vast improvement to the locality, but it will constitute one of the most imposing frontages in the metropolis.

THE SCHOOLS OF ART.—Mr. Norman Macleod (the Registrar of the Government Department of Science and Art) has printed a list of the schools of Art throughout the united kingdom, in connection with the department, completed to May, 1856. From this list the following abstract may be given:—Established as schools of design, between 1841 and 1852, nineteen local schools. Established as schools of Art, since 1852, when the department was constituted—in 1852, two schools; 1853, fourteen schools; 1854, fourteen schools; 1855, two schools; 1856, four schools—thirty-six schools: total, fifty-five schools; including the nine London district schools, sixty-four schools. Number of persons under Art-instruction in public schools, 18,198; in central schools, 9041; grand total, 27,239 persons.

MEISSONIER A FOLLOWER OF IZAAK WALTON.—The *Artiste*, in a recent number, tells us that Rachael ordered a picture of Meissonier, of which she gave the piquant subject—"Fontaine reading his Fable of 'The Two Pigeons' to Racine and Boileau." Each figure was to have the price of 5000 francs, or £200, attached, and the work was to be finished, it is presumed, within a certain time. The subject was sketched, and one 5000 francs handed over, when, unfortunately, the fishing-season, with a tempting aspect, came in. Away is flung the canvas, back go the frames, and the painter abandons his study for some streamlet, there to illustrate the Johnsonian definition of an angler—a rod and a line, with a fool at one end, and a worm at the other.

KNIGHT'S COSMORAMA STEREOSCOPE.—This is a modification of the very popular instrument by Sir David Brewster. The advantages which it professes to afford are the greater facility with which the double images are made to form one picture, less fatigue to the eyes of the observer, and the ready adjustment of focus to different sights. By employing lenses of greater focal length, larger pictures may be viewed, hence its distinguishing name, the Cosmorama Stereoscope. Its peculiarities will be understood from the following description:—In place of the two small semi-lenses employed in Brewster's lenticular stereoscope, Mr. Knight takes a plano-convex lens, $3\frac{1}{2}$ inches diameter; this he cuts down the centre into two halves; these being placed together, an equal portion is removed from the opposite diameters. These two halves are now reversed, and the cut edges are brought together; this forms the cosmorama stereoscopic lens. Thus the outer diameter of the original lens is now the centre, and the centre of the original now forms the outer portions, on which the eyes of the observer rest in looking through it. This being the best part of the lens, may, in some measure, explain the reason of the presumed superiority of this form of stereoscope. We cannot refrain from expressing our hope that with some modification of this form of instrument, we may have public exhibitions on a large scale, in which Nature in all the perfection of her dimensions may be viewed, and the eye may be gratified by looking on realisations of scenes hallowed in history, without the fatigue of long and tedious

travel. In the charming miniature-scenes which are now familiar to most persons, the great want, especially when the human figure is not introduced, is the means of appreciating the size of objects. The mind does much, but not all that is necessary.

PHOTOGRAPHY UNDER WATER.—In a recent number of the *Journal of the Society of Arts* is an account, by Mr. W. Thompson, of Weymouth, of the means he has adopted for taking a photograph at the bottom of the sea, at a considerable depth. The camera was placed in a box, with a plate-glass front, and a movable shutter to be drawn up when the camera had reached the bottom of the water. The camera being focussed in this box on land, for objects in the foreground, at about ten yards, or other suitable distance, was let down from a boat to the bottom of the sea, carrying with it the collodion plate, prepared in the ordinary way. When at the bottom the shutter of the box was raised, and the plate was thus exposed for about two minutes. The box was then raised into the boat, and the rocks and weeds then lying in the bed of the ocean appeared represented in the usual manner. There is no real novelty in all this, for it has long been known among scientific photographers that such pictures could be taken under water; but the advantages have not hitherto been thought to be commensurate with the cost and labour of carrying out the process effectually. We hope Mr. Thompson may succeed in perfecting his process, so as to render it actually useful.

COUSIN'S "BOLTON ABBEY."—An early proof of this well-known engraving was recently sold by auction in the rooms of Messrs. Sotheby and Wilkinson for 40 guineas—it was originally published at 12 guineas.

TAKING THE BUCK.—*Sir Edwin Landseer, R.A.*—We have been much gratified by the inspection of an important picture by the above eminent artist, at Mr. Bryant's Gallery, St. James's Street; and are anxious to draw attention to a production so fully and favourably embodying those peculiar felicities of conception and execution in which Sir E. Landseer has long stood, and still stands, unrivalled. The picture depicts most graphically an incident of exciting action. A fine stag is just fastened by the hounds, having been secured by a rope firmly grasped by the huntsman. The whole picture, painted some years since, is a masterly effort, and evidences, together with the special fidelity and power of this artist's pencil, an amount of elaboration which he rarely bestows on his present works. The subject is of large dimensions,—8 ft. 6 in. long by 7 ft. 6 in. high,—the figures and animals being the size of life. There is no doubt that an engraving of this work would be extremely popular. We recommend the numerous admirers of Sir E. Landseer (and they include all lovers of Art) to inspect this picture; indeed, Mr. Bryant's Gallery will well repay a visit, as it contains a number of admirable pictures, both by ancient and modern masters.

THE FIRST VISIT OF QUEEN VICTORIA TO HER WOUNDED SOLDIERS.—This is another offspring of the war, and one that chronicles its holier influences. It is recorded in the annals of the day that soon after the home-coming of several wounded soldiers, her Majesty visited them at the hospital at Brompton, and personally expressed her sympathy with their sufferings: the Queen did this accompanied by the Prince and their children. So touching an incident forms a theme worthy of Art; and the artist, Mr. J. Barrett, has very effectually dealt with it. The picture is now exhibiting at 162, Piccadilly, and is about to be engraved. A more desirable contribution to English homes cannot well be devised; happily, in all things the example of the Queen of England influences for good every class and order of her subjects.

AN APPEAL TO THE BENEVOLENT.—We are desirous of directing the notice of such of our readers as are in a position, as well as disposed, to render charitable aid, to an advertisement in our columns headed as above. The case to which it refers is one eminently worthy of assistance.

IRON-WORK IN MILAN.—A correspondent writes to us to say, that "if some one of the numerous societies for the promotion of Manufacturing Art in England were to procure drawings, or even photographs, of the many iron gates, &c., in Milan, they would be a great acquisition to the British iron-trade." A published book of designs from the beautiful iron-works of the Continent is greatly needed here.

REVIEWS.

AN INTRODUCTION TO THE STUDY OF ÆSTHETICS. By JAMES C. MOFFAT, Professor of Greek in the College of New Jersey, Princeton. Published by MOORE, WILSTACH, & Co., Cincinnati; S. Low, Son, & Co., London.

The study of Æsthetics has, from the time of Christian Wolf, about a century back, been a favourite subject of inquiry with many German writers, whose speculations are rather curious than satisfactory; this is evident from the fact that scarcely any two of them arrive at a similar result as regards the principles of the science. The truth is that any attempt to theorise beauty, or to bring the perception of it within certain definable laws, as we would any ordinary branch of science—for this is what we understand by the somewhat indefinite term Æsthetics—must be only speculative; for, inasmuch as the sense to realise beauty varies according to the faculty a man possesses to perceive it, it seems impossible to reduce the subject to such a system as can be universally accepted. This appears to have been the opinion of Kant, who denied the possibility of the science of beauty—strictly so-called—because beauty is not a property of objects, as affirmed by Baumgarten and Winkelmänn, but has its origin in the disposition of our mental faculties.

Within the last half century this branch of philosophical inquiry has engaged the attention of other continental writers, as well as some in our own country and in America, the latest of the Transatlantic idealists who have given publicity through the press to their theories being Professor Moffat, who announces that the design of his treatise "is to draw a line around that portion of philosophy which pertains to Art, indicating the main sources of the wealth which it contains, and the limits which its cultivators have assigned to themselves." The professor includes within the word Art a much wider range of subject than that popularly assigned to it, and to which most writers on Æsthetics limit it; for to painting and sculpture he adds poetry, oratory, and a certain class of literary productions. His book is by no means a dry, mystical, and uninviting compound of theories; but a readable and instructive volume, containing a large portion of truth, good sense, and sound moral, and even religious, teaching with a very little alloy of unprofitable speculation: the perusal of it cannot fail to benefit the reader. There are two passages we have marked for quotation: the one because, for the most part, we agree with the writer; the other, because we entirely dissent from his opinions. In the former he says:—"The relations of modern Art to society are unprecedented, and full of obscure but lofty promise; . . . architecture, painting, and statuary, especially, are in the present day in a woeful state of chaos and indecision. Some, looking back to the lofty and well-defined purpose and masterly execution of former times, are turning their hopes to a revival of exclusive fraternities as the only means of correcting the present disorder. But all such attempts are vain: history never repeats herself. We are evidently in the transition state to something greater than has yet appeared—an age of Art, where no exclusive caste or profession shall dictate style, but the enlightened taste of a whole people, under the nobler, moral, and religious light of a pure Christianity. The transition state must necessarily be chaotic, but the elements will arrange themselves correctly in the end, and the greater their number and diversity, the higher shall be that Art which effects their harmony."

The other passage is this—it is from the chapter headed "Critical Authority":—"Whence does criticism derive its authority? From the dictatorial style of the anonymous and mysterious reviewers of recent times, one is haunted with the impression that they must be something more than men, enjoying revelations on the subject of taste, which it must be impious to controvert. All the leading reviews of the day are addressed to such an impression. Taking for granted that they alone are correct, and that none other has a right to any opinion at all, they never manifest the shadow of a suspicion that they can, by any possibility, be guilty of a mistake. Behind the screen of the review, and the editorial *we*, the critic, no matter how ignorant or stupid, assumes to himself infallibility, and writes as one having authority. Constituting himself a judge, and regarding the author as a culprit arraigned at his bar, he proceeds, in the awful majesty of office, to pronounce that sentence which he deems must be final—incontrovertible, because he has said it. Very rarely is there any, the least, show of reasoning on common principles, or any attempt to justify the decision by clear and cautious argument. The unknown critic is supreme—his word the law."

Now in these remarks, both ungenerous and unjust, Professor Moffat is not alluding to compar-

tively obscure publications; for he immediately refers to the *Edinburgh*, the *Quarterly*, and the *North American Review*; and adds, that "many a decision received as the authoritative voice of the very Delphi of criticism, has afterward been woe-folly shorn of its glory, contracted in its dimensions, and treated with a contemptuous everyday familiarity, when found to be only the private opinion of Lord Jeffrey, Sydney Smith, or Mr. Macaulay." Why Mr. Moffat has singled out the Whig critics for his animadversions rather than Lockhart, Professor Wilson, Alison, and others on the same side of politicians, we know not; but sure are we that no review of any pretensions, in our own country at least, exhibits the spirit imputed to it in the foregoing remarks. As a general rule the critics of the present day deliver their judgments—dictated by sound learning and a thorough acquaintance with the subject they undertake to discuss—not as tyrants or dictators, but as scholars and gentlemen: Mr. Moffat would rank them with the public executioner; he would make Macaulay a literary Robespierre, and would couple Lord Jeffrey with Judge Jeffries. We protest against his verdict; his own judgment must have been terribly warped to arrive at such a conclusion, while it seems an absurdity to have to defend such men from such an attack.

THE FRESCOES OF GIOTTO. NOTICES OF SCULPTURE IN IVORY. Published by the Arundel Society, London.

The Arundel Society has issued another set of engravings, by Dalziel, from drawings by W. O. Williams, from the frescoes of Giotto, in the Chapel of Santa Maria dell'Arena, at Padua. In noticing a former series of these works, at the commencement of the last year, we asked, "What possible benefit, either to artists or the public, can arise from the circulation of these prints?" and the sight of the four just placed in our hands only suggests to us the same inquiry. With all our veneration of the antique, and our respect for the name of Giotto, we cannot, for the life of us, supply a satisfactory argument for thus revivifying him from the sepulchre where he has lain for five centuries and a half. It is one thing to visit Padua on a tour through Italy, and see there what his mind and his hand wrought, as we should go to see anything else that is curious or historically interesting, but quite another thing to have his works brought home to us in their present form; however, this is rather the affair of the society at whose cost they are executed, than our own: we only think that its funds might be employed far more profitably to its subscribers and to the public. In the first print—the "Marriage at Cana"—are eleven figures: Christ is on the extreme left of the picture, speaking to a servant; to the right is the "governor of the feast," holding a cup to his lips—a coarse, corpulent figure, the type of "Simon, the cellarer:" one or two of the heads in the composition are successfully expressed. The second print represents the "Raising of Lazarus;" the resuscitated disciple appears to have been studied from an Egyptian mummy; he has not burst asunder his cerements, but stands closely bound hand and foot, and with the most ghastly aspect. A man so encumbered could never, except by the influence of a second miracle as great as the re-animating of the spirit, have obeyed the Divine command—"Come forth!" The prostrate figures of Martha and Mary are ludicrously drawn. "Christ's Entry into Jerusalem" is next in rotation. In this also are some good studies of heads, and the composition, as a whole, has fewer defects of drawing than the three others; but the figures in the trees "cutting down branches" are absurdities; and the manner in which one of the "multitude" is "casting her garments in the way," by drawing it over the head, can only excite a smile. The "Expulsion from the Temple" is the last of the series: the scene lies outside of the building—a sort of Byzantine edifice, with a pulpit at the angle of the porch. Christ is represented striking with his clenched fist a man who carries a birdcage. Though Giotto, like David, kept watch over the sheepfold, and was thus employed when Cimabue found him sketching, it seems he paid little attention to the anatomy of the animals he had the care of, for it would puzzle the most learned zoologist to determine the creatures here intended for sheep. Certainly this publication does not increase in our favour as it proceeds; and we willingly turn from it to the other which the Arundel Society has issued at the same time—the *NOTICES OF SCULPTURE IN IVORY*. This work consists of a lecture by Mr. Digby Wyatt, delivered last year at the first annual general meeting of this society, on the history, methods, and chief productions of the Art; and it also contains a catalogue by Mr. E. Oldfield, M.A., of the specimens—casts of which are in possession of, and are sold by, the society—of ancient ivory carvings in various collections. In

the illustrations which ornament this book photography has done the work of the engraver. There are nine of these, by Mr. J. A. Spencer, representing some of the most beautiful specimens of ivory carving in the collection, principally of book-covers, tablets, diptychs. We see here works of real Art, which one can examine with pleasure and profit. Mr. Wyatt's lecture offers an intelligent and interesting history of sculpture in ivory from the earliest period.

THE COMPLETE ANGLER; OR, CONTEMPLATIVE MAN'S COMPANION OF ISAAC WALTON AND CHARLES COTTON. Edited by EDWARD JESSE, Esq. To which are added PAPERS ON FISHING-TACKLE, FISHING-STATIONS, &c. By HENRY G. BOHN. Published by H. G. BOHN.

A book containing five hundred pages, two hundred woodcut illustrations, and twenty-six engravings on steel, at the price of 7s. 6d., is a marvel even in these days of cheap literature and cheap Art. Many of these prints have indeed already done duty elsewhere; but they are valuable none the less, and are for the most part highly meritorious in execution, while they are true and interesting as portraits of the things and places they represent. As a manual for the angler, it is without precedent in value—nothing has been omitted; all he likes to see, and think about, and talk of, and use, he will find here; while a practised, and not “a prentice hand,” has gone over the whole, so as to bring it together with rare value and effect. Published just now, when the lakes and rivers are inviting pilgrims, and the fish are absolutely eager to be caught, the book is more than welcome, for it contains all that can be required for instruction and enjoyment as concerns “the gentle craft.” Old Isaac cannot be read too often; one of the sweetest, humblest, and most gracious of God's creatures, who thoroughly loved his art, and who desired that all who would should share his pleasure, he bequeathed to the world a legacy which furnishes forth to-day capital as it did yesterday—and remains the source to which all must go who angle by the river-side amid the rich beauties of Nature. The time of the angler is never idly spent; and we maintain, upon the highest authorities, and against those who have written otherwise, that in this sport there is no cruelty, for fish have little or no sense of pain; abundant proofs might be adduced in support of this assertion. Mr. Bohn has thus added another to the many valuable books he has issued—books so cheap that they are attainable by all classes, and so good as to satisfy those who can afford to pay high prices for luxuries, but who may be, and are, well content with these editions of standard works in British literature.

MEMOIRS OF JOHN KITTO, D.D., F.S.A., COMPILED CHIEFLY FROM HIS LETTERS AND JOURNALS. By J. E. RYLAND, M.A. WITH A CRITICAL ESTIMATE OF DR. KITTO'S LIFE AND WRITINGS. By PROFESSOR EADIE, D.D., LL.D., Glasgow. Published by W. OLIPHANT & SONS, Edinburgh; HAMILTON, ADAMS & Co., London.

There are few literary men of the present age whose editorial labours have been more productive of advantage to the public than those of the late Dr. Kitto, who died at Cannstatt, in Germany, whither he had gone, in 1854, in the vain hope of recruiting his health. As the editor of “The Pictorial Bible,” and “The Cyclopædia of Biblical Literature,” and as the author of “Daily Bible Illustrations,” with other works of a similar religious tendency, he has earned a reputation in matters of biblical study and literature, which men of much higher pretensions might envy. This he attained through a life which, as Mr. Ryland truly observes, “was, from childhood to the grave, a strenuous, unintermitting conflict with difficulties and trials of no ordinary kind.” Sprung from a family of low origin, the grandson of a Cornish miner, he worked his way to his position by his strong energy, his unwearied labours, and his deep, earnest piety. “In whatever aspect we view him,” writes Dr. Eadie, “he is a wonder. It is a wonder that he rose in life at all; a wonder that he acquired so much; and no less a wonder that he wrote so much. Many have excelled him in the amount of acquisition, but few in the patience and bravery which he displayed in laying up his stock of knowledge, in the perfect mastery he had over it, and in the freedom and facility with which he dispensed it in magazine, review, or treatise.” The history of such a man is pregnant with fruitful instruction: a large portion of the biography presented to us consists of letters written at various periods—some of them dated from Plymouth Workhouse, of which, as a boy, he was for years an inmate; others when on his travels in Russia and in the East—and of extracts from his private journal. It is an interesting narrative.

THE SCIENCE OF BEAUTY, AS DEVELOPED IN NATURE AND APPLIED TO ART. By D. R. HAY, F.R.S.E. Published by W. BLACKWOOD & SONS, Edinburgh and London.

Having “said our say” upon Mr. Hay's theories as they have been propounded in his books that have come under our notice at various times, we need not enter upon a critical examination of this volume after the information we find in his preface. We are there told:—“My theory of beauty in form and colour being now admitted by the best authorities to be based on truth, I have of late been often asked, by those who wished to become acquainted with its nature, and the manner of its being applied to Art, which of my publications I would recommend for their perusal. This question I have always found difficulty in answering. * * * Under these circumstances, I consulted a highly respected friend, whose mathematical talents and good taste are well known, and to whom I have been greatly indebted for much valuable assistance during the course of my investigations. The advice I received on this occasion was to publish a *résumé* of my former works, of such a character as not only to explain the nature of my theory, but to exhibit to the general reader, by the most simple modes of illustration and description, how it is developed in nature,” &c. This quotation will sufficiently explain what is to be found in the volume, while it relieves us from the task of wading through it.

THE LIVES AND WORKS OF MICHAEL ANGELO AND RAPHAEL. By R. DUPPA and QUATREMERE DE QUINCY. Illustrated with Fifteen Engravings. Published by H. G. BOHN, London.

This volume forms one of the series of Bohn's “Illustrated Library;” but, with the exception of the engravings now introduced, it is precisely the same book as that published a few years since in Bogue's “European Library;” it is, in fact, a reprint of the latter form, we presume, stereotype plates. De Quincy's “Life of Raphael” is perhaps the most comprehensive biography of the great Urbinese painter that has yet been written; the translation used here is by Hazlitt—both that and Dappa's “Life of Michael Angelo” are well worthy of being again brought into notice. The engravings which illustrate the volume include “The Cartoon of Pisa,” a fragment of “The Last Judgment,” “The Temptation and Expulsion,” and “Christ Scourged,” all after M. Angelo; and from the works of Raphael, “The Draught of Fishes,” “The Charge to St. Peter,” “The Death of Ananias,” “Paul and Barnabas at Lystra,” “Peter and John Healing the Lame Man,” “Elymas the Sorcerer,” “The Transfiguration,” &c.—compositions that, however well known, never pall on the senses.

A CYCLOPÆDIA OF GEOGRAPHY, DESCRIPTIVE AND PHYSICAL. By JAMES BRYCE, M.A., F.G.S. Published by RICHARD GRIFFIN & Co., Glasgow.

A good general gazetteer of the world, comprehended within moderate limits, was much wanted. We have several bulky volumes, varying in their degrees of correctness and completeness, but all of them more or less objectionable on account of their size. We have carefully examined the “Cyclopædia of Geography;” we have sought for sundry out-of-the-way places, and have found them, with sufficient descriptive matter to satisfy us, and much also we did not expect to find. We can therefore conscientiously recommend this gazetteer as a useful companion in every library. In one volume of great compactness we appear to have all that is desired in a gazetteer, and some additional matter of much usefulness, in the form of a guide to the correct pronunciation of the names of cities, &c.

BRITISH POISONOUS PLANTS. By CHARLES JOHNSTON, Botanical Lecturer at Guy's Hospital. Illustrated with Twenty-eight coloured Plates, transferred from “English Botany.” Published for the Proprietor, J. E. SOWERBY, 3, Mead Place, Lambeth.

This is a little book which no school-room of high or low degree should be without. It has been suggested by the frequent occurrence of death by poison, from inadvertently—or ignorantly, we should rather have said—eating of pernicious plants growing in our fields, hedgerows, and wildly in gardens. It was not very long since the papers announced the deaths, in Scotland, of two or three gentlemen, if we remember aright, who partook of Monkshood, taken up from a garden in mistake for Horseradish. Had the gardener's boy, the unfortunate author of the calamity, received the instruction to be derived from Mr. Johnston's book, this sad occurrence might have been averted. We cannot

too highly commend this valuable treatise to the notice of heads of families and of schools everywhere.

PRACTICAL PERSPECTIVE. By R. BURCHETT, Head Master of the Training and Normal School. Published by CHAPMAN & HALL.

Among the many treatises on Linear Perspective which have of late years come before us, Mr. Burchett's must hold a good place: it forms the course of lectures on the science delivered by him at Marlborough House. Perspective offers to the young painter no one of those pleasing studies which are associated with all else he has to learn, and yet he must make its acquaintance practically, and to some extent theoretically, ere he can accomplish what he has to do: he must first learn to draw correctly ere he attempts to colour; and as Mr. Burchett observes, “he must be warned that he must not begin at the end or in the middle; he must not expect to understand fig. 15 before he has mastered fig. 5; but that he must be satisfied to acquire his knowledge in the order of the pages; that he must not be content with reading, but must assure himself that he understands both test and figures.” This advice is not very satisfactory to those who look for a “royal road” to the acquisition of the science; but it is nevertheless perfectly true. All the student can expect from the teacher is a guide to show him the right path, and a friendly hand to aid him over the stumbling-blocks—and perspective has many—in his way: he will find both in this work.

PRIZE ESSAY ON THE STEREOSCOPE. By WILLIAM O. LONIE, A.M., &c. Published by the London Stereoscopic Company.

A prize of twenty guineas was offered by the London Stereoscopic Company for the best Essay on the Stereoscope. Fourteen essays were submitted to the judgment of Sir David Brewster, whose award was in favour of the present essay, as giving “the most correct account of the laws of binocular vision, and of the theory of the stereoscope.” This intimation from an authority of such eminence is a sufficient recommendation of the essay. It may, however, be thought by many that it is one of a high philosophical character, and hence requiring much previous scientific knowledge to render it intelligible. This is not the case: the essay is written in a clear and simple style; and every one possessing a stereoscope should learn the principles upon which its phenomena depend, which they may do without difficulty by a careful perusal of what Mr. Lonie has written.

A PRACTICAL SWISS GUIDE. By an ENGLISHMAN IN SWITZERLAND. Published by LONGMAN & Co., London.

English tourists on the continent will soon be “on the wing” across the channel. To those who meditate a visit to Switzerland we would strongly recommend that before starting they provide themselves with this useful little guide-book—really a “pocket” one, but it contains a large amount of useful information as to the best routes, distances, hotels, charges, the most interesting features of the respective localities—in fact, all a traveller requires to know, whether he meditates a run through, or to proceed by easy stages.

SONGS OF THE BRAVE. Published by S. LOW, SON, & Co., London.

A small collection of war-poems and odes by Campbell, Wolfe, Collins, Byron, Tennyson, and C. MacKay, illustrated with some charming little woodcuts, from drawings by B. Foster, E. Duncan, G. Thomas, and A. Huttula, beautifully engraved by Haral, Evans, and Cooper, forming an elegant and appropriate literary tribute in honour of the soldiers and “mariners of England.” Most of these poems are already well-known; but it was a good idea to bring them together and illustrate them in the style we find here.

A FEW REMARKS ON THE PICTURES OF 1856. Published by HARRISON, London.

What could have induced the anonymous author of this pamphlet to incur the cost of printing it? A few commonplace, ignorant remarks upon about fifty pictures in the Academy, and a score or so in the gallery of the Old Water-Colour Society, are all it contains: to call it a criticism would be an absurdity. A man who can only “devote a few spare moments” to the inspection of upwards of a thousand works of Art, should not wildly rush into print with his observations, even if he had the ability to criticise them—which this writer certainly has not.

THE ART-JOURNAL.

LONDON, AUGUST 1, 1856.

THE PORCELAIN MANUFACTURE OF CHINA.*

THE TECHNICAL PROCESSES.

IN the foregoing number we gave a short summary of the historical portion of M. Julien's interesting work on the manufacture of Chinese porcelain: in the present number we shall first make a few observations which, in strictness, belong to the preceding part of our subject, and shall then endeavour, with the assistance of M. Salvétat's excellent preface, to give some account of the technical processes of the Chinese, and to point out the principal differences between the Chinese and European methods of manufacture and decoration.

The manufacture of porcelain in China divides itself into two great branches, which are carried on systematically and with true Chinese perseverance. The first of these is the manufacture of *original* kinds of porcelain. In this branch there is apparent a constant endeavour to produce varieties, and to take advantage of every improvement, domestic or foreign, by the adoption of colours imported from Europe, and by the study of European porcelain—many examples of which have found their way to the imperial manufactory at King-te-tchin. The second observation which occurs to us relates to the *imitative* habits of the Chinese, in which they are not surpassed by any people upon earth. The same fidelity of imitation which induced the Chinese tailor to put a patch upon the knee of a new pair of trousers that he had made to pattern for an English officer, because the pattern had a patch in that situation, induces the Chinese manufacturer to make imitations—which are, in fact, reproductions—of every description of porcelain to which any value is attached, or which present any peculiarities in their composition or mode of decoration. The great value set upon many kinds of old porcelain is undoubtedly a great temptation to the manufacturer to produce facsimiles of them, and to dispose of them as genuine specimens of certain kinds of porcelain. Some of these imitations, even when known to be such, have, as before observed, been sold to Chinese collectors for a sum equal to 7500 francs. The third book of the Chinese work consists entirely of an account of the imitations of ancient Chinese porcelain made at King-te-tchin. In the sixth book is another catalogue of enamels and ancient vases imitated at the same manufactory. Among these we find enamels on metal—an art which we ascertain from the first book the Chinese received from the Arabs, and also from the French—and several specimens of European china of different colours, and probably of different modes of fabrication, including the Dresden or Sèvres porcelain, ornamented with figures in relief. Upon these counterfeits the Chinese author remarks—"The European taste, literally the spirit of the pencil, is closely imitated in the manner of painting and of applying the colours."

The last remark we shall make is for the benefit

of our English collectors of old china. It is to the effect that *the Chinese make porcelain expressly for the foreign market*. This circumstance, coupled with the passion of the Chinese for collecting examples of their most ancient and valuable porcelain, and the abundance of spurious specimens, renders it extremely problematical whether the finer and more scarce descriptions of porcelain ever find their way into this country.

It may be necessary to remind the reader that the Chinese and Japanese porcelain, as well as almost all that is made in France and Germany, is of the description called "hard porcelain;" and that the manufacture of hard porcelain in England is at present limited. The material first claims our attention.

Porcelain, as the reader is probably aware, is composed of two ingredients, one of which is fusible, the other infusible. The infusible portion consists of an argillaceous paste, the common European name of which, *kaolin*, is borrowed from that of the principal locality in China where it is found. The fusible portion constitutes the transparent glaze to which porcelain owes its peculiar character; it is composed of felspar, or petrosilex. The Chinese call it *pe-tun* (white paste) or vulgarly, *pe-tun-tse*. The use of the kaolin is to give firmness to the porcelain, in the same manner as, to use a Chinese comparison, the bones of the skeleton support the softer mass of the flesh. The kaolin is prepared for use by washing; the pe-tun by grinding and levigating.

There are several kinds of kaolin in China, but they are all obtained from the department of Jao-tcheou-fou, in the province of Kiang-si. The specimens of kaolin sent from China, at the request of M. Julien, yield, on washing, abundance of mica, which M. Salvétat considers to be a proof that they are produced by the decomposition of true granitic rocks. In this respect the Chinese kaolin differs from that of Saint-Yrieix, which owes its origin to the disintegration of pegmatites; the latter are composed entirely of quartz and felspar. In the preparation the mica is carefully separated; for, if suffered to remain, it would cause the porcelain to crack.

The mountains which produce the Chinese pe-tun are twenty leagues from the porcelain manufactories. The stone is dug out of the solid rock; and the best kind is that which, on being split, is found to be dendritic. This appearance is owing to the presence of oxide of manganese. The inhabitants of the district take advantage of the streams which descend from the mountains to erect water-wheels, by which the stone is ground. After being washed and purified it is formed into bricks, called *pe-tun*, or white paste.

The mode of preparation is detailed in Books v. and vii., and in the notes to the same (pp. 117—124, 255) will be found the results of M. Salvétat's analysis of the Chinese kaolin and pe-tun, as compared with those of Saint-Yrieix. Most of the Chinese pastes contain more or less of oxide of iron, which communicates to the porcelain a disagreeable tint.

It may be mentioned here that M. Salvétat found that in general Chinese porcelain contains more silica than that of Sèvres; but that the latter, together with the German porcelain, contains more alumina than any other description of pottery which has been examined. The Chinese pastes have been analysed by M. Salvétat; the result, as compared with the paste used at Sèvres, will be found stated at page lxxxiv.

For coarse stone-ware the Chinese use kaolin alone; but for porcelain this material is combined with petrosilex (pe-tun). For the coarser kind, the petrosilex is in greater quantity; for the finer kinds most argile is used. The ingredients are ground together in a mortar for a long time, and then purified by washing. The supernatant particles, being the most valuable part, are collected in another jar. The finer portion is purified a second, and also a third time, in the same manner. The last produce is used for the finest porcelain.

Instead of kaolin, the Chinese sometimes use steatite,* or soap-stone, for the "bone" of small articles in porcelain. The material is said to be excellent; but when glazed the colour is not so fine as

* The steatite, called by the Chinese *hoachi*, was found to be composed of white amphibole (?), dolomite, and steatite.

that which results when the enamel has been applied upon a biscuit composed of pe-tun, which causes it to appear more polished and brilliant, as well as more agreeable to the eye. Père d'Entrecolles says that porcelain made of steatite is rarer and dearer than other kinds; that it has a very fine grain, and as regards the painting, it bears to other porcelain the relation that vellum does to paper. It is remarkably light in weight, extremely fragile, and there is great difficulty in regulating the burning. Sometimes, instead of making the "bone" of steatite, this material is made into a kind of glue, into which the dry porcelain is plunged, and becomes coated with steatite, after which the glaze is applied. This process renders the appearance of the porcelain more beautiful.

A square reservoir or tank is then built of bricks close to the furnace, in order to take advantage of the heat. The paste is put into this tank to evaporate the water. When dry, it is pounded with pure water, and made into vases and other articles. For this purpose the wheel is sometimes used, and sometimes the clay is cast or fashioned on moulds. The moulds consist sometimes of one piece, sometimes of several. Many of the articles are finished on the lathe.

The wheel used in China is a round table of wood, pierced by a vertical axis, the lower extremity of which is fixed into the earth, and is so contrived that it can be made to turn continually. A man, seated on a bench, which forms part of the machine, pushes against the wheel with a bamboo stick, which causes it to revolve. He supports the mass of paste with both hands, and shapes it at will, and with the utmost precision. The vase is suffered to dry in the sun, and the shape perfected; water is then thrown upon it from a large camel's hair brush. It is afterwards washed and polished, and, after receiving the enamel, is ready for firing.

Ornaments in relief are attached by cementing them with *barbotine*—a composition consisting of the porcelain paste mixed with glue.

So far the European and Chinese processes are not very dissimilar; we must notice some particulars in which the Chinese processes differ from the European.

These variations refer chiefly to the following points:—1. The composition of the glaze. 2. The mode in which the glazing is effected. 3. The application of the glaze before the firing. 4. The mode of attaching the foot of the vase or other article. 5. The preparation of the colours.

1. The composition of the Chinese glaze differs from the European in being more fusible. At Sèvres the glaze is composed entirely of the pure pegmatite finely ground, and deposited by immersion on the baked porcelain (technically called *dégourdi*). In Germany the fusibility of the felspar is modified by the addition of other substances. The glaze of the Chinese and Japanese porcelain is a compound, the ingredients of which are varied and determined in different proportions, according to the nature of the product required. The fusible properties of the Chinese glaze are attributed by M. Salvétat to the lime which it contains—sometimes in the proportion of one-fourth of the weight of the glaze—and not to the ashes of fern leaves which are mixed with it. The only object in mixing the fern leaves seems to be to purify the lime. The Chinese, who have compared the kaolin and pe-tun, of which their porcelain is composed, to the bones and flesh which constitute the human body, carry on the comparison by calling the lime the soul of the glaze. The glaze, like the kaolin and pe-tun, is brought to the manufactory in barges; it is white and liquid. The Chinese frequently defraud their customers by the addition of water, which increases the bulk of the article, while they conceal the cheat by throwing in sufficient gypsum to prevent the mixture being too liquid. As a fraud, this is certainly objectionable; yet the addition of fibrous gypsum to the glaze is not always hurtful. It is employed for specific purposes as well by the Germans as the Chinese. In some cases coarse sand is added to the quartzose felspar, which forms the base of the enamel.

2, 3. The European method of applying the glaze is founded upon the observation that China clay, like other argillaceous earths, ceases to be diffusible in water after it has been exposed to a red heat. Before, therefore, the pieces are immersed in the glaze,

* Continued from p. 200.

they are fired, and in this state are, in France, termed *dégourdi* [Ang. *biscuit*?]. By this process they are rendered porous and absorbent, and the material can no longer be diffused in water. The articles are then glazed by simple immersion in water, which holds in suspension the glaze.

This practice, at once so economical and so rapid, although practised in Japan, is almost unknown in China, where its use appears to be limited to the manufacture of two kinds of porcelain only. The usual method of applying the glaze is by aspersion, or by the immersion of the article formed of the *raw* paste only, which of course is easily acted upon by water. The process is sufficiently difficult when large pieces are to be glazed; much more so when they are small and thin. In the latter case another method is resorted to. The end of a tube of bamboo is covered with gauze, which is filled with the glaze, either coloured or uncoloured; the workman blows into the other end of the tube, and the glaze is detached from the gauze, and fixes itself upon the porcelain. M. Salvétat thinks that these different methods, which he describes in detail, are deserving of being tried by European manufacturers.

4. After being glazed, the next process is to apply the foot upon the still unbaked porcelain. When this is done, the piece is ready for the firing. The furnaces are situated at a distance from the workshops, and the persons who attend to them do nothing else. The porcelain is carried to the oven on long planks, two of which the workman carries at a time on his shoulder.

There appears to be some doubt as to the form of the furnaces now used by the Chinese. The following description is taken from Book v., and agrees apparently with the representations in the woodcuts. M. Salvétat is inclined to think that a change has taken place in the form of the furnaces since the Chinese text was written, and the drawings made.

The ovens or furnaces are described as being bell-shaped. Above each, and not touching it, is a sloping roof, supported on timber or bamboo. The furnace is ten feet in height and width, and about twenty feet in length and depth. The chimney, twenty feet high, rises above the sloping roof. The floor of the furnace is covered with a thick bed of gravel, which serves to support the *seggars*.

The *seggars* or cases in which the porcelain is baked, are made of several kinds of clay, distinguished by the colours, which are black, white, red, and blackish-yellow. After being baked they are fit for use. The best Chinese *seggars* cannot be used above ten times, and in many cases not so often, whereas those used at Sèvres can sometimes be employed forty times. In this respect the European manufacturers have nothing to learn from the Chinese.

Unless the piece of porcelain is very small, it has a *seggar* to itself, but in all cases care is taken to prevent the adhesion of the porcelain to the *seggar*, by the interposition of a bed of sand and coarse kaolin. Great care is also necessary in the arrangement of the pieces within the cases, because the glaze, having been applied upon the raw and yielding material, the form of the vase is very liable to injury.

The porcelain having been placed in the *seggars*, the latter are laid in piles, the upper ones serving as covers to those which are beneath. They are then put into the furnace, space being left between each pile to allow the flame to pass. The *seggars* next the chimney, as well as the two lower and the upper one of each pile, are empty, for in these the porcelain would not be properly burnt. The vases are arranged in that part of the furnace which is best adapted for them, according as the enamel or glaze is hard or soft. The finest porcelain is placed in the centre. When the furnace is filled with the *seggars* the fire is lighted, and the opening blocked up, except one hole, through which the fuel is, by the care of two men, continually inserted. Five openings, covered with a piece of tile, are also left in the roof, in order to observe when the porcelain is sufficiently baked. When the *seggars* in front are of a vermilion-red colour, no more fuel is added, and, after waiting a day and a night, the furnace is opened. This generally takes place about three days after the lighting of the fire. The perfection of the porcelain, observes the Chinese author, depends in a great measure upon the temperature of the furnace, and the regulation of this depends entirely on the experience

of the fireman. On the fourth day, very early in the morning, the furnace is opened. The *seggars* which cover the vases of porcelain still retain their red colour, so that they cannot be approached except by the workmen, who make themselves a kind of gloves of linen, ten times doubled, and wetted with cold water, to protect their hands from the heat. They also cover their heads and persons with wet rags; thus defended, they enter the furnaces, and carry away the porcelain. When they have removed all the *seggars*, they take advantage of the remaining heat to put fresh ones into the furnace. The humidity being soon absorbed, these frequently crack. Speaking of the shrinking of the paste in baking, the Chinese author says that a vase a foot high will, after firing, be reduced to seven or eight inches.

5. The skill with which the Chinese decorate their porcelain has been justly celebrated. The variety of the grounds is not less remarkable than the originality of the decoration, and the harmonious richness of the painting. The Chinese possess in perfection many of the decorative processes employed in the European manufactories. They not only engrave with the point, and model figures in relief after the fashion of the Sèvres china, but they also execute with great skill ornamental perforated or network.

The decoration of porcelain forms a very interesting part of the manufacture, especially when the processes used in China are compared with those of Europe.

To appreciate the difference we cannot do better than give a brief *resumé*, interspersed with such information as we can collect from the Chinese work, of M. Salvétat's remarks on this subject. After mentioning that in Europe various processes are employed, M. Salvétat observes:—"Sometimes pastes of different colours are employed, sometimes the colouring matter is introduced into the glaze, sometimes the colours are laid upon the surface of white porcelain. The first two modes of decoration require to fix them a temperature as high as that which is necessary for the firing of the porcelain; such colours are technically called *couleurs de grand feu*. When, on the contrary, the colours are painted on the surface of the porcelain, those colours only are employed which require for their vitrification a temperature much lower than the preceding. These are called *couleurs de moufle*. It is by the use of the moufle colours only that European manufacturers have, during the last fifty years, been able to produce on porcelain effects previously attainable by oil-colours only, and to imitate perfectly on porcelain the works of the great masters of Art."

The colours used by the Chinese in the decoration of porcelain may be arranged under the same classes as those employed in Europe. We shall notice first those which require a high temperature.

It requires but a slight acquaintance with Chinese porcelain to observe that the colour most frequently used in China is blue. We are not, therefore, surprised to find several chapters of the fifth book of M. Julien's work devoted to the description of the material which supplies this colour, also the mode of preparation and of application.

The Chinese distinguish the porcelain painted with blue flowers into four epochs:—namely, first the porcelain of Siouen-te (1426—1435); second, of Tch'ing-hoa (1465—1487); third, of Kia-tsiung (1522—1566); and fourth, of Wan-li (1573—1619). The first three belonged to the great dynasty of Ming. Although the porcelain of the period Tch'ing-hoa, in the artistic qualities of the painting, greatly exceeded that of the Siouen-te period, yet the blue employed in the latter was far superior to that used by the artists of the former time. The employment of this colour for painting or colouring porcelain in China is of great antiquity. The china of Toug-ngeou, made during the dynasty of the Tsin (A.D. 265—419), and very celebrated in its day, was blue.

The blue used in China is the product of a native mineral, which has been ascertained to abound in almost all the provinces of the empire. From the description of the Chinese author, as well as from a minute analysis of specimens brought from the province of Yun-nan, M. Salvétat is satisfied that the substance in question is a cobaltiferous peroxide of manganese. It is called by the Chinese *wou-ming-i*. The mineral, which is of a blackish-yellow colour, is first washed in baskets in the mountain-streams, it is then conveyed by merchants to the place where

the furnaces are situated; there, after being enclosed in a porcelain vessel, it is roasted. It is then removed, carefully washed, and sold to the manufacturers. The loss in roasting is from 20 to 30 per cent. The blue pigment is of three qualities: the first, or best description produced, when burnt, a fine blue; the second, a pale blue; the third, grey. For every pound of fine blue the produce is scarcely seven ounces; the second and third qualities suffer a proportionate loss by roasting. The value of the first quality is equivalent to 180 francs for the Chinese bushel; of the second quality, 90 francs per bushel; of the third quality, 25 francs per bushel. The colour is washed and ground before it is used, and is black until after it is burnt, when it is a fine blue. Before using it on the porcelain it is tried on a fragment and baked. When the whole vase is to be coloured blue the colour is applied beneath the glaze, and one of two methods is adopted. 1st. The colour is diluted with water, into which the vessel is plunged. 2nd. The colour is applied by blowing it through a tube, in the manner before described. Pêre d'Entrecolles remarks—

"This kind of porcelain is dearer and more scarce than where the colour has not been blown, because it is more difficult to produce by this process a uniform tint. The glaze is applied after the colouring. When blowing on the blue, the workman takes care to preserve the colour which does not settle on the porcelain by placing the vase on a pedestal which stands on a large sheet of paper. When dry the blue is separated by rubbing the paper with a small brush."

The rapid and economical plan of colouring the porcelain before the application of the glaze has been successfully practised at Sèvres. M. Salvétat observes that the Chinese bake their porcelain at a much lower temperature than the French manufacturers. This is no doubt owing to the more fusible nature of the Chinese glaze. The Chinese author remarks that if the temperature of the furnace be too high, the greater part of the blue flowers will disappear.

Besides the native blue pigment the Chinese use cobalt blue, properly so called. This, which is a finer colour than their own, they receive from England.

Among the *couleurs de grand feu*, which may be easily produced by attending to the prescriptions in the Chinese books, are the lake-coloured grounds, varying in tint from orange to purple; these sometimes have a bronze-like lustre. The description of the colouring substance is so precise, that there is not the least doubt as to the nature of the mineral employed for this purpose, which, according to M. Salvétat, is a ferruginous earth. The directions for producing the above tints are, he adds, perfectly exact: they also indicate extremely well how the Chinese avoid colouring those reserved spots on which blue designs are afterwards introduced.

Some of the grounds belonging to this class of colours (*couleurs de grand feu*) have not yet been produced in Europe. Among these are red and orange grounds, which owe their colour to the protoxide of copper, and those of the light bluish-green colour, called *céladon*, so much admired by amateurs. In chapter xi., of Book vi., which M. Salvétat considers one of the most important in the collection, the composition of the different kinds of coloured enamels is described. It is rendered more valuable by the notes of M. Salvétat.

The last of the *couleurs de grand feu* of the Chinese which we shall notice, is black. This, we are told, is sometimes the result of the coloured glaze applied in a mass; sometimes of the superposition of several colours of different tones—as, for instance, of a brownish lake (*brun de laque*) upon a blue glaze, or of a blue upon brownish lake.

M. Salvétat next notices some colours on oriental porcelain which have been applied upon the *biscuit*, that is to say, upon porcelain which has already been baked at a high temperature. These are always found to be covered with minute cracks, like fine network. Upon touching the colours with fluorhydric acid, it is found that oxide of lead enters largely into their composition. Hence, as these occupy a sort of intermediate position, M. Salvétat distinguishes them as *couleurs de demi-grand feu*, and remarks that there are no colours analogous to them at Sèvres. Among these colours are violet, turquoise-blue, yellow, and green, which he thinks might be easily

initiated; the green and the blue with copper; the yellow with lead and antimony; the violet with manganese slightly tinted with cobalt. M. Salvétat's account of his own experiments on colours fusible at a low temperature is well deserving of the attention of the manufacturer.* Directions for preparing these intermediate colours will be found in M. Julien's work, to which the reader is referred. Concerning these directions, M. Salvétat remarks that from the analyses he had been able to make, and the syntheses that he had attempted, frequently with success, he had come to the conclusion that the greater part of the prescriptions given in the Chinese books are sufficiently exact, at least as regards those of which the synonyms were easily produced. The Chinese prescriptions, or recipes, for producing the colours so much admired, are now, by the industry and exertions of M. Julien, placed within the reach of European manufacturers. We trust, therefore, it will not be long before they are reproduced in this country. One observation of M. Salvétat's should not be overlooked—namely, that many of the coloured grounds on Chinese porcelain seem to be the result of accident, and not altogether of design; and that colours composed as these are, of different minerals with the white glaze, will always be subject to variations, according to the predominance of one or more of the ingredients, and to the temperature of the furnace. Although the actual imitation of certain shades of colour must always be the result of direct experiment, yet when once the colour has been obtained by this means, the European manufacturer has a great advantage over the Chinese; inasmuch as the education of the former, in all that relates to the Art-Manufactory, having been more scientific, he understands better the causes and effects of the different processes and combinations, and is, therefore, in a situation to reproduce on scientific principles those colours by the production of which the Chinese, with much more limited knowledge, have attained a world-wide celebrity.

Before speaking of the muffle colours, M. Salvétat notices shortly the colours which, in Europe, and especially at Sèvres, constitute the palette of the porcelain-painter, and the properties which they should possess.

These colours, he says, should be capable of fixing themselves firmly to the surface of the porcelain, and of acquiring at the same time, by fusion, the glaze which is one of the indispensable conditions of the brilliancy of this kind of painting. They are all produced by mixing either an oxide, or a composition of different metallic oxides, with a vitreous flux (*fondant*), the composition of which varies with the nature of the colour which is to be developed. The flux which is most generally used is called *fondant aux gris*. It is used for greys, blacks, reds, blues, and yellows, and is composed of—

Minium	6 parts
Siliceous sand	2 "
Glass of borax	1 "

The colours are generally obtained by mixing together three parts of the flux with one part of the metallic oxide. The general formula may be thus expressed:—

Silica	16.7
Oxide of lead	50.0
Borax	8.3
Colouring oxides	25.0
	100.0

Sometimes, as in the case of cobalt, it is necessary that the oxides and the flux should be fritted before being used. Sometimes they are only mixed together, and used as pigments without being fritted or calcined. In Europe it is considered especially requisite that these colours should all melt at the same time, and present, after the firing, a sufficient and uniform glaze.

The colours on the Chinese paintings do not fulfil these conditions: some are glazed, others dull; some are flat, others raised above the surface. The style of the painting is also very different from ours. It is always strictly decorative, never pictorial. There is no gradation of light and shade, no modelling of the figure, the outlines of which are defined only by red or black lines. The colours are applied in flat tints, reminding one of the mosaic-like stained glass of the 13th century, in which the design was made

out by red or black lines traced upon the coloured or white glass.

Considering the thickness of the colours employed, and yet their want of intensity, M. Salvétat concluded that the Chinese pigments contained but a very small proportion of the colouring matter. This opinion was confirmed by experiments, in which it was proved that "the colours which the Chinese have employed so advantageously, as regards the brilliancy of effect and the harmony of the decoration, have greater analogy with the vitrified substance known as enamels, than with any other substances."

Besides their great simplicity, a general characteristic of the Chinese colours for porcelain-painting is, that the flux, which is not distinct from the pigment, is always composed of silica, oxide of lead,—which is not subject to great variations in its proportion,—and a greater or less quantity of alkali. The flux holds in solution, as silicates, a very small portion of colouring matter. The colouring matters are—oxide of copper for greens and blue-greens; gold for reds; oxide of cobalt for blues; oxide of antimony for yellows; arsenic and stannic acid for white. The only exceptions are the oxide of iron, and the impure oxides of manganese, which yield, the one red, the other black—these last-mentioned colours cannot be obtained by solution in the flux.

Some of the colours are employed in the state they are supplied by commerce; others require additions, in order that they may all be fusible at the same temperature. The manufactory at Sèvres has been fortunate enough to obtain two sets of colours, ready prepared for porcelain painting, from artists in China. Lists of these colours will be found in the work of M. Julien (pp. 215—220). The analyses of their composition, by MM. Ebelmen and Salvétat, have been published in the "Recueil des Travaux Scientifiques de M. Ebelmen," tom. i. p. 377. Precise recipes for composing the Chinese colours, or as they are called, *enamel*s, are also contained in Book vi. of M. Julien's work. These are elucidated by the notes of M. Salvétat. The proportions of the different ingredients are given in Chinese weights, which are explained at p. 223.

It has been remarked,* that in Europe the colours for painting on porcelain are formed by the mixture of certain oxides and certain fluxes; that the Chinese colours differ not only in the composition of the flux, but in the proportions of the colouring matter, and in the number of the colouring agents, which are so limited in the Chinese, and so extensive in the European manufactory. "The palette of the European porcelain-painter comprises many substances unknown in China. Thus the colour of cobalt is modified by combining it with the oxide of zinc and alumina, or with alumina and the oxide of chrome. The pure oxide of iron furnishes about ten shades of red, varying from orange-red to very dark violet; from ochres are obtained pale or dark yellows or browns, by combining in different proportions the oxides of iron, of zinc, of cobalt, or of nickel; browns are made by increasing the quantity of oxide of cobalt contained in the composition which furnishes the ochres; blacks, by the suppression of oxide of zinc in the same preparations; yellows are varied by additions of zinc or tin to render them paler, by oxide of iron to deepen the colour. The oxide of chrome, pure or combined with the oxide of cobalt, or the oxides of cobalt and zinc, gives yellow or blue-greens in infinite variety. Metallic gold yields the purple of Cassius, which can be changed into violet, purple, or carmine. Besides these, we possess the oxide of uranium, the chromates of iron, of haryta, and of cadmium. We shall close this list of colours by alluding to the very recent application of metals incapable of oxidation by fire, the discovery and preparation of which require chemical knowledge far beyond that which the Chinese possess. All these different colouring matters are in the European colours in the form of simple mixture; in the Chinese colours, the oxides are, on the contrary, dissolved, and in this respect they bear a great resemblance, not only in the colouring principles, but in the composition of the flux, to what are called in France, *enamel*s."

The resemblance has been confirmed by the manner in which the colours imported from China behaved in the firing. Experiments were made on

European and also on Chinese porcelain. Upon the Chinese porcelain the colours were developed at a lower temperature than that which is used for retouching the paintings of flowers in the manufactory at Sèvres, and they did not scale off. On the Sèvres porcelain the colours, though developed, scaled off. It has been long known that, on account of this very defect, enamels could not be used for the decoration of European porcelain. This want of adherence is to be attributed to the different nature of the glaze of the two kinds of porcelain—that of China being rendered more fusible than the European by the addition of lime, which perhaps modifies its dilatability, and assimilates its physical properties to those of enamels. "If," continues M. Salvétat, "Chinese porcelain differs from ours in its appearance, if the harmony of their paintings is more varied, the cause is to be sought in the methods employed by the Chinese. Their pigments contain but little colouring matter, and their effect depends upon a certain thickness, which gives to their paintings a relief impossible to be attained by other means; the harmony of their paintings is the result of the nature and composition of their enamels." It may be observed that the resemblance of the colours used for painting on porcelain to enamels, is noticed in the Chinese work (p. 171); and the colours used on porcelain are, in another part of the work, called enamels (p. 206, &c.)

The Chinese colours are diluted for painting either with a solution of mastic, with animal size, or with pure water. The first causes the colours to flow with facility; the second is useful in retouching; water is employed where the colours are thick, and also for filling in. M. Salvétat gives the preference to water as a vehicle for the colours.

When the colours have been applied, the porcelain is again baked to fix the painting. Two kinds of furnaces or muffles are used for this purpose—the one sort are open, the others closed. The latter are employed for small works, and resemble those used in Europe for enamels, properly so called. They are fully described at pages 172—174. There is a very quaint representation in the last woodcut, of a Chinese stoking a furnace, filled apparently with coal. He holds before his face a large screen, in which is an aperture for him to look through. His head and back are protected by a hood, and his hand by a kind of glove.

We must now bring our notice of Chinese porcelain to a close, but before laying down the pen, we should like to call the reader's attention to a few points in which the manufacturing processes of the Japanese differ from those of the Chinese. The former people burn their porcelain twice—in this respect adopting the European process. After the first firing, the biscuit (*déglourdi*) is washed, cleaned, and painted. The colour, which is generally blue, is mixed with water; two coats of the glaze are then given, and the porcelain is re-baked in the principal furnace.

The Japanese do not appear to be generally acquainted with the art of painting with enamel colours like those of the Chinese. It is related that one manufactory in a certain locality practised this art, as well as that of laying on gold and silver, but the processes were kept secret. Vitreous colours were reported to have been used. It is also stated that vitreous matter was mixed with the glaze of the old Nanking porcelain, and that the glaze had partially scaled off, whence it was called "worm-eaten porcelain." This ware is now extremely rare, being only met with as presents or objects of curiosity. "One of the beauties of the Nanking porcelain," observes Dr. Hoffman, "is that the designs appear to be above the glaze, whereas, in the blue porcelain of Japan, the painting was applied before the glaze. The first effect can only be obtained by having recourse to vitreous compositions, which are not used in Japan; but the method adopted in that country is, from its greater durability, better adapted for articles of domestic use."

M.

[At the present day the Ceramic Arts of every kind seem to possess a peculiar interest in England; a fact which would, if excuse were necessary, furnish a sufficient apology for the introduction of this and the preceding paper. At no former period of its history have such enormous sums been paid for antique porcelain ware; indeed, the enthusiasm of collectors has reached a point which almost amounts to an absurdity.—Ed. A.-J.]

THE ROYAL PICTURES.

"GO, AND SIN NO MORE."

E. Corbould, Painter. C. H. Jeens, Engraver.
Size of the Picture 4 ft. 2 in. by 3 ft. 3 in.

"ALL Scripture," we read in the Sacred Volume, "is given by inspiration, and is profitable for instruction," &c. To those who are able to realise the truth of this statement there are few narratives contained in Bible history of which the artist, no less than the preacher, may not make a wise use, under such laws and conditions as time, society, and circumstances, may impose upon him. The incident related by the Evangelist St. John, which Mr. Corbould has illustrated with so much simple yet affecting feeling, is a lesson to the self-righteous—unhappily the world is too thickly populated with this class of individuals to render such teaching unnecessary. We are all too ready to estimate others by a standard of excellence we ourselves form, and which generally is in ourselves, or assumed to be. We hail the transgressor to our self-constituted tribunal, and condemn him without the reflection that our own acts, if brought to the bar of conscience in all truth and sincerity, are not less reprehensible. We may not be guilty of a direct theft, but we may be extortioners, and may "oppress the hireling." We may not take away the life of a fellow-creature, yet may whisper away his good reputation. We may not fall down before the graven image, and yet may offer idolatrous worship at an altar whose deity is the author of all unrighteousness. And thus the Temple of Jerusalem is not the only place from which the command should go forth—"He that is without sin among you let him first cast a stone."

The artist has treated his subject according to the literal version of the evangelist. Christ had entered the Temple, and all the people were assembled to hear the lessons of wisdom from the lips of Him who "spoke as never man spoke." The great opponents of his ministry—the scribes and self-righteous Pharisees—bring in the fallen woman, and set her in the midst of the congregated throng. This appears to be the point in the narrative Mr. Corbould has illustrated, rather than that which appears in the title he has adopted; for when those words were spoken, the accusers had all gone out, and "Jesus was left alone, and the woman standing in the midst." Here, however, we see her cast down on the ground in the attitude of deep humiliation, her hand concealing her face, expressive of grief and shame. The figures seated, and those standing behind them on the left, we may presume to be the people who had come to listen to their Divine teacher; but among those seated is one habited as the high priest. The accusers stand, according to the custom of such; and one of them has advanced, as if for the purpose of arguing with one of Christ's disciples. He who "came not to condemn the world, but to save it," stands in an attitude of disguised authority, but with a benignant expression of countenance, more significant of pity for the transgressor than of sympathy with her accusers.

There is a broad treatment of chiaro-oscuro in this painting, which is well calculated to make an effective picture. The principal light falls full on the two figures most prominent in the scene, and the draperies of each being buff and white respectively, additional force is produced by this arrangement. The draperies of the other figures are richly coloured. The faces and extremities are finished with the care and delicacy always apparent in the works of this artist.

The picture, a drawing in water-colours, is in the collection at Osborne. It was purchased by Prince Albert soon after his arrival in England, from the Gallery of the New Society of Painters in Water-Colours, of which institution Mr. Corbould has long been one of the strong supports in historical subjects. We have heard this was the first picture his Royal Highness bought here, and that it attracted more than usual notice when exhibited—as those who interest themselves in Art-matters, and had heard of the purchase, were curious to know what kind of taste the Prince Consort possessed. When the young branches of the Royal Family were of a suitable age to derive benefit from instruction in drawing, Mr. Corbould was selected by Her Majesty to teach them the accomplishment he so ably practises.

SUGGESTIONS OF SUBJECT
TO THE STUDENT IN ART.*

BY AN OLD TRAVELLER.

CHAPTER VII.

Confessors of the early Church—Vivia Perpetua—Renunciation of the God—A General of other days—Brasidas at Methone—The Fort of Pylus—Sea-fight—Fall of the leader—Vows to Minerva—Crowned at Scione—Death at Amphipolis—General Wolfe—Marquis of Montcalm—Richard the Good—Spirits appellant—The Duke's decision—The offender cited—Miracle—Varied views—"The Water Lady"—Harvest-time—A city in the waters—The Protector—A republican envoy—Royalty and its defenders—Spanish fashion under Philip IV.—A statue in spectacles—Colour, or the marble?—Venus Victrix—The nymph and the god—An Oread—The Pleiad Maia—The Camena—Hesiod.

To the reader of early Christian history, the touching story of Vivia Perpetua is well known; her life was made familiar to a yet wider circle, some years since, by the admirable drama of a writer too early lost to the world of letters;† but lest there should still be some among our readers not yet acquainted with it, the mere facts shall be related in a few brief words.

Dwelling with her family in Carthage, but of Roman descent and nobly-born, Vivia Perpetua has been converted to the Christian faith: this is discovered by her father, by whom she is at once denounced to the priest of Jupiter: he furthermore drives her from his home in implacable displeasure, and she is thrown into prison. Here every effort is made to win her back to the rites she has abandoned, but all are vain: in her prison she becomes the associate of slaves, but her Christian faith has taught her to consider these, not as beings of an inferior order, as inculcated by the code of the heathen, and as she once believed, but as fellow-creatures, to whom the common rights of humanity are due, even as to herself: nay, when ultimately condemned to death, it is with one of the despised race, formerly a slave of her own, that Vivia Perpetua advances to meet her fate.

But first the noble convert has repaired in silence and loneliness to the Temple of Olympian Jupiter—of that idol whom, in other days, she devoutly adored—her purpose, to renounce her allegiance to the false god. And here, O Sculptor, have you, no less than the Painter, a subject worthy of your utmost devotion. Evening shades are falling, the great and sumptuous fane is solitary, save for the one figure, deeply mournful, though firmly resolved—the once pious votary, who has sought the shrine for such unwonted purpose. Majestic in its soul-given force is the form, and beautiful in holiness is the face of her now solemnly raising abjuring hands towards the deity so long revered. She is not kneeling—that day has passed; firmly, yet with no arrogance of mien, she stands before the abandoned altar, and these are the words she utters:—

"Lo! where all trembling I have knelt and prayed,
Where vow and sacrifice at morn and eve,
Shrouded in incense dim, have risen to appease
The wrath, great Jove, of thy once dreaded thunder—
Up to the might of thy majestic brows,
Yet terrible with anger, thus I utter:—

"I am no longer worshipper of thine!
Witness the firm farewell these steadfast eyes
For ever grave upon thy marble front;
Witness these hands—their trembling is not fear—
That on thine altar set for evermore
A firm renouncing seal—I am a Christian!

* The shadows blacken, and the altar-flame
Troubles them into motion—god of stone,
For the last time, Farewell!"‡

This for the Sculptor more especially—yet the Painter can scarcely do better than choose it also; and the rather as there is no impediment to his reproduction of Olympian Jove in all the pomp described by Pausanias. The grandeur of fine architectural effects—the awful presence of the Sphinxes—the imposing aspect of the Victorines—the varied beauties of the Olympian gods, richly clustering around their chief—the inspiring loveliness of the

Graces and the Hours, are all for him: nay, the ebony and ivory, the gold and the precious gems, also lending their aid to enhance the effect of the gorgeous whole, are not forbidden to his pencil, although the Sculptor must feel restricted to a much less complete exposition of the eloquent historian's lifelike picture. But leaving these questions, and returning for a moment to Vivia Perpetua—the drama that is to say—it may perhaps be not out of place to remark that there are many other studies, whether for the Painter or the Sculptor, within the comparatively few pages of that graceful work, and the votaries of either art would do well to accept the inspiration, breathing its salutary influences from so pure a source.

It cannot be but that some one or more among the youth of our Studios will be turning their attention to themes of war for some time to come—the declaration of a paper-peace notwithstanding; and here is a General whose life will supply them with many a fair theme.

The Lacedemonian, Brasidas, is the commander in question, and some portion of what Thucydides has related of his noble deeds, is briefly transcribed below; but whosoever shall determine to make the glorious history of the Spartan the subject of his meditations, must turn to the pages themselves, and to these, with that understanding, we propose to refer as we proceed.

Thus it is then that our historian—who, be it remembered, was an Athenian, the contemporary, the opponent in arms, and, in so far, the enemy of Brasidas—first speaks of the Lacedemonian general, by whom Athens was so effectually kept in check even to the close of his life: nay, by whom her predominance was all but entirely destroyed—since it was the untimely death of Brasidas which alone saved Athens from certain, if not immediate, subjugation.

The Athenians, with the Coreyreans, had effected a landing at Methone, in Laconia, and were assaulting the city, which was wholly unprepared for defence; of this event it is that Thucydides speaks as follows:—

"Now Brasidas, the son of Tellis, a Spartan, happened to be in command of a guard for the defence of those parts, and on hearing of the attack, he came to the assistance of those in the place, with a hundred heavy-armed. Dashing therefore through the army of the Athenians, which had its attention directed towards the wall, he threw himself into Methone." It is true that he lost some few of his own men in thus entering Methone, but he saved the city, and for this daring deed "he was the first who received public praise at Sparta in that war."* Here then you have the first of your pictures from the life of Brasidas.

Wise in council as brave and ready in arms, we next find our Spartan hero dispatched to Alcidas, the Lacedemonian admiral, whom he greatly assisted in the preparations then making against Coreyra.† Subsequently we have the discussion of an event, which, in the dearth of all movement now suffered by the painter of sea-fights, can scarcely fail to rivet his attention: we allude to the part taken by Brasidas, in the renowned attack on that fort erected by the Athenians at Pylus. Let us hear what Thucydides says concerning it.

Encouraged by a most inspiring speech from their commander, Demosthenes—for which I refer you to the author—the Athenians were well prepared to receive their enemy, when the Spartan ships—of which there were forty-three, their admiral being Thrasymedidas, the son of Cratesicles—advanced to the attack. "So the Athenians defended themselves on both sides, landward and seaward, while their opponents, divided into detachments of a few ships each, because it was not possible for more to bring to, came against them with all eagerness and mutual exhortation, each seeking if by any means he might force the passage, and take a place in the fight.

"But the most distinguished of all the Spartans was Brasidas; for, being captain of a trireme, and seeing that in consequence of the difficulty of the position, the captains and steersmen, even where it

“GO, AND SIN NO MORE”

FROM THE PICTURE IN THE ROYAL COLLECTION

LONDON: PUBLISHED FOR THE PROPRIETORS

did seem possible to land, shruuk back and were cautious of wrecking their vessels, he shouted out and said, that it was not right to be chary of timbers, but he bade them shiver their vessels rather than fail to force a landing. The allies of Sparta he exhorted not to shrink from sacrificing their ships, in return for the great benefits they had received from the Lacedemonians, but to prove their gratitude on the present occasion, and run their ships ashore, so as to land by any means, thus securing both the men and the place.

"In this way did Brasidas urge on the rest, and having compelled his own steersman to run the ship ashore, he stepped on the gang-board, and was preparing to land, but before he could wholly effect his purpose, he was cut down by the Athenians. It was not until he had received many wounds that Brasidas fell, but at length he dropped fainting into the ship's bows, his shield at the same moment slipped from his arm into the sea, when, being thrown ashore, it was secured by the Athenians, who afterwards placed it conspicuously on the trophy they erecled."

Ships from Zacynthus reinforced the Athenians, and the Spartans were compelled to retire; but if Brasidas had not secured success, he had done more—as we have high authority for declaring—by so effectually deserving it, wherefore let this event also find place on your canvas.*

Recovered from his wounds, Brasidas next proceeds to Megara, which he saves, not from the Athenians only, but from the fatal irresolution of its own citizens, and from the consequences of the factions struggling and intriguing of parties, each for itself, within the walls. He then makes a rapid march through Thessaly into Thrace; and at a later period of the war, it was the probity and ability of Brasidas that most availed to detach from the Athenians the best of their allies, and to win over to the Lacedemonian interest the cities thus estranged. Of this fact the wise counsels offered to Perdicas, at the Pass of Lynceus, shall suffice as proof: by his own steady persistence in acting on the principles announced in these councils it was, that Brasidas ultimately succeeded in detaching the King of the Lyncestian Macedonians from his alliance with Athens, a most important advantage to the Lacedemonian cause.†

For the admirable oration of Brasidas to the Acanthians, I refer you to the author;‡ his surprise of Amphipolis, must also be passed over; but your conception of our hero's exalted character may be aided by the recollection that his clemency to the Amphipolitans caused other cities, previously in the alliance of Athens, to send messengers desiring the protection of Brasidas. It was thus that the Spartan obtained possession of all the towns in the territory called Acte—Sane and Diium alone excepted.

Torone he brought over to the Lacedemonians in like manner, and in like manner were the inhabitants conciliated by the wise measures of Brasidas. To Leocythus he granted a truce of two days, when one only had been demanded by the citizens for the burial of their dead. Devout as brave, the Lacedemonian general had no sooner captured the city, than he commanded that a large sum of money should be presented to the Temple of Minerva—that goddess having, as Brasidas believed, secured his success by causing the fall of a formidable tower, erected by the defenders to oppose his progress; and in further proof of gratitude, the whole site was declared to be sacred when the city of Leocythus had been razed to the ground.

Having compelled the Athenians to accept a truce, the following clause was inserted among others, by the influence of Brasidas, and may further help you to a clear appreciation of the piety, integrity, clemency, and moderation which he joined to his other great qualities as a general:—

"With regard to the temple and oracle of the Pythian Apollo, we agree that all who desire access thereto may be permitted to have it, without deceit and without fear, according to the laws of our several countries. The Lacedemonians, and such of their allies as are present, agree to this, and declare that they will use their best efforts to persuade the Boeotians and Phocians to do so, by heralds sent for

that purpose, proceeding uprightly in respect to the treasures of the god, and acting in accordance with the laws of our respective countries."

At Seione the same policy produced similar effects; and here Brasidas, having convened an assembly of the people, did so effectually win their hearts, that a crown of gold was decreed to him, as to the liberator of Greece. This was conferred on him publicly with other marks of honour, and you can scarcely do better than exhibit to us his fine face and noble figure, as he stands amidst his glad compatriots, expecting the glorious tribute about to be placed on his brow by the Scironian arehons.

Of his advance on Potidæa, and much besides, we must be silent for lack of space; proceeding to give a brief account of his glorious death in the arms of victory, and refraining from the reproduction in this place of more than a very few words from the commencement of his address to the troops, when leading them, for the last time, to meet Cleon, the general of the Athenians.

"Men of the Peloponnese, with regard to the character of the country from which we come—namely, that by its bravery it has always maintained itself a free country, and that you are Dorians about to engage with Ionians, to whom you are habitually superior—let a brief declaration suffice."

He then proceeds to give good reasons for confidence, exhorts all to their duty, affirms in very few words his own readiness to do and dare, as he advises others to do, and ultimately marches at the head of his troops.

But the descent of Brasidas from Cerdylum—where he had taken up his position—could not be made without attracting the attention of his antagonist, Cleon, the general of Athens, whom he found prepared to receive him. The Athenians were routed nevertheless, and it was while harassing their retreat that Brasidas received a mortal wound, and fell dying to the earth. Taken up by certain soldiers of the Chalcidian horse, he was "carried, still breathing, into the city (Amphipolis), where he lived to hear that his troops were victorious, but expired after a short interval."

"He was buried, at the public expense, in front of what is now the market-place. All the allies attended in arms; and the Amphipolitans, having enclosed his tomb with a fence, have ever since made offerings to him as to a hero, giving him the honour of games and annual sacrifices."

"The Athenian commander, Cleon, was also killed in this battle—or rather was slain, as he fled, by a Myrcinian targeteer."*

You will all be reminded of our own general, Wolfe, by more than one passage of the life of Brasidas: the death of each in the arms of victory carries on the parallel, while the fall of the English commander's noble antagonist, the brave and accomplished Marquis of Montcalm, is represented, in a certain sort, by the fate of Cleon.

Of the various points of time proper to your purpose, each will judge for himself; the costume, in all its details, is sufficiently familiar to all; the form of the ships, more especially that of the trireme, is known to every schoolboy, and needs no description.

Among the "Judgments of Richard the Good," as set forth in the quaint old Norman French of Wace, many a curious scene of varied interest will be found; now full of a racy humour, and anon most deeply pathetic. You will find more than one instance of both kinds in the "Romance of Rollo:" here, for example, is a narrative that may be translated something after this wise.

Now there sped forth a certain monk on an evil errand; he looked behind him fearfully as he left the abbey-gate; but there was none to spy his purpose, and noting this, with heart well satisfied, he passed joyfully on his way.

One step followed fast on another, and the wayfarer came to the brink of a river. Yet the waters, though roaring angrily, do not stop him; he crosses deftly by the bridge, until he comes to the midst thereof, then did there open to him a chasm, which he had not marked till the yawning mouth received him, and the monk sank drowning in the torrent.

Thereupon came the devil, who had gone with him step by step, though he wist it not: he now draws the soul from the body of that monk, and is bearing it to a fiery dwelling; but the sinner's guardian angel rushes to earth, and requires the fiend to resign his prey.*

"Hercin you do me wrong," remonstrated Satan, "for I found this monk on an evil path, and he belongs to me."

"Not so," replied the angel; "since he was only on the way, and might have returned, repenting him of his intent."

"Nay, but he is mine of right," insisted the demon; "seeing that this was not the first of his journeys in the direction you wot of; and even as he fell into yon wave, was that sinner meditating a return on the morrow, should the continued absence of his superior afford him occasion."

"Touch him not, for all these things," rejoined the guardian spirit; "neither will I take him—but let us bear him to Richard the Good; he shall judge between us, and by his judgment will we abide."

"Thou hast said well," assented Satan; and keeping the soul in their charge, vigilantly watched between them, the Spirits of Light and Darkness repaired to Richard: they found him sleeping in his bed, but he aroused himself to hear them.

Their story told, the good duke declares that neither shall have the soul, which he bids them return to the body, commanding them to place the monk on that precise spot of the bridge whence he had fallen, but by no means to let the chasm opened in the midst thereof be apparent to him.

"If then he take but one step on his evil path," continued the upright judge, "he is thy property, O Fiend of all mischief—take him and work thy will: but if he turn him from his purpose, let him depart in peace—so may thine hour to claim him, fair Spirit of Light, be yet permitted to come."

This being done as commanded, the monk made no further step towards the misdeed he had meditated, but hastened back to his cell; the Spirits also went their way, each to the work appointed them.

Passing over the contention of Satan with the guardian angel,—as already sufficiently indicated when discussing the before-mentioned passage from Dante,†—let us consider if there be not the elements of a picture, in the audience accorded by Duke Richard to his remarkable clients, as described in the story. The rude walls of the good duke's chamber, the unglazed aperture preceding the window of a later period,‡ giving ample views of the country without, may serve for background. Before them is the simple couch whence he has just risen; his tall stature and large form, with the rich fair hair and clear blue eyes, all common to men of the Gothic race, are well contrasted by the delicate beauty of the ethereal spirit, and by the dusky, yet also beautiful presence of the fallen angel; while the shadowy appearance representing the soul of the monk, will serve usefully to exhibit that mastery over his art which we are surely not wrong in attributing to that one among our youthful painters who may take this work in hand.

A second picture, from the same source, might show us Richard the Good when, repairing on the following day to the abbey whence our monk had attempted the notable escapade recorded above,—and to which the latter had returned *tout penaud*, as aforesaid,—he requires that erring brother to appear before him.

This the poor monk is compelled to do. But see the miracle! his habiliments are pouring streams from the river as he walks—they threaten to inundate the church wherein our present scene is laid; for these garments cannot be dried until the culprit hath made confession of his fault in the presence of all his brethren. Here, then, we have him constrained to perform that penance, and he is opening a rueful mouth for the purpose, to the boundless terror and amazement of the simple-looking old abbot, who is standing with his attendants near the duke.

But there are other and differing expressions in

* For minute details of all these things see Thucydides, vol. i., book iv. 2—15.

† Hist. Pel., book iv. 83—84.

‡ Thucydides, book v. 85—87.

* Hist. Pel., book v. 10, 11.

* An incident of closely similar character is related by Dante. See the "Purgatory," canto vi.

† See *Art-Journal* for April of the present year, p. 104.

‡ It is true that glass had been then used for some time by the more luxurious of the Norman great; but Duke Richard had been reared hardily, and taught to hold such indulgence in contempt.

the faces of the brethren scattered at intervals about the choir. One stands rooted in holy horror; others exhibit varying emotions; some would fain look more shocked than they feel, if they knew how to set about it; while some few, and they not far from the abbot either, 'tis sorrowful to say, have the air of men who could very easily look as much amused as shocked, did the presence wherein they stand permit the free expression of their feelings.

Has any painter reproduced on his canvas the pictures originated by Flood in the verses that follow? It would seem to be impossible that they should have escaped the notice of artists; yet we do not remember to have seen a work on this theme in any one of our exhibitions—neither have we remarked designs from it in the various portfolios that have been from time to time permitted to our inspection. Be this as it may, here are the lines in question:—

THE WATER LADY.

- "Alas! that moon should ever beam
To show what man should never see:
I saw a maiden in a stream,
And fair was she.
- "I staid awhile, to see her throw
Her tresses back, that all beset
The fair horizon of her brow
With clouds of jet.
- * * * *
- "I staid to watch a little space
Her parted lips, if she would sing;
The waters closed above her face
In many a ring.
- "And still I staid a little more:
Alas! she never comes again.
I throw my flowers from the shore,
And watch in vain.
- "I know my life will fade away—
I know that I must vainly pine;
For I am made of mortal clay,
And she 's divine."

It will not greatly task your ingenuity to find much more than meets the ear in the fanciful and beautiful verses just recited. Hear also the following—they transport you to a wholly different region; but in every clime the fervid hours of these glowing harvest-days invite to the reproduction of the charming picture presented by them. Make no delay—such skies as these do not always light our goodly fields, even when the rich amber of their abundant harvests waves over them in changeful hues, as now. Let the painter take his picture while he may, then; so shall many rejoice in the gladness brightness of its fair being, even when the hoar days of winter are upon us. Place! ample and honoured place, for the lovely scene and its lovely occupant, as the poet has set them before us:—

RUTH.

- "She stood, breast-high, amidst the corn,
Clasped by the golden light of morn;
Like the sweetheart of the sun,
Who many a glowing kiss had won.
- "On her cheek an autumn flush
Deeply ripened—such a blush
In the midst of brown was born,
Like red poppies grown with corn.
- "Round her eyes her tresses fell,
Which were blackest none could tell;
But long lashes veiled a light
That had else been all too bright.
- "And her hat, with shady brim,
Made her tressy forehead dim.
Thus she stood amidst the stocks,
Praising God with sweetest looks.
- "Sure, I said, Heaven did not mean,
Where I reap thou shouldst but glean;
Lay thy sheaf adown, and come,
Share my harvest and my home."

A pleasant town is the Hague, always providing, and be it hereby enacted, that none but the worst of men shall be compelled to remain within the somewhat level precincts thereof—save "during pleasure." Let him who, not being in the above-named category, finds his patience early washed out of him by the watery influences of the place, have permission to depart, but not until he hath painted—for my rule extendeth only over such as take pencil and pallet in hand—not, I say, until he hath painted for me some features of the following incident. The facts were related to the writer in the year 1841, by one whose ancestor of the period had taken part therein.

During a portion of that time when Oliver Cromwell made the name of our country to be respected in all lands—accuse him who will of his *forfaits* and *méfais**—the stern republican St. John, a man of haughty and repulsive manners, held the post of English plenipotentiary at the Hague. At the same time it chanced that the Duke of York, who had found refuge in Holland, was one day pacing sadly along the public walk, when he was observed by Mr. St. John; and the latter, needlessly changing his course, to the surprise of certain persons with whom he was conversing, took pains to cross the path of the duke, at whose downcast features he looked half-contemptuously as he passed, but without eliciting the slightest remark from the prince, who, absorbed in his reflections, did not appear to perceive the interruption.

Arriving at the place of departure as the duke was leaving the walk, Mr. St. John rudely stepped forward, and, with his hat on his head, took precedence—James of York modestly drawing back as he became aware of the Englishman's intention, but with an expression of astonishment at the discourtesy of his uncalled-for intrusion.

The Prince Palatine, who came up in time to see what was done, instantly lifted off Mr. St. John's hat with his cane, remarking, with pretended politeness, but with a manner which he took care to make sufficiently significant, that the English ambassador had failed to perceive the presence in which he stood.

St. John felt the sarcasm, and laid his hand on his sword, but disapproval of his unhandsome conduct was written in all faces: every man of distinction there present gave point to the reproach by standing respectfully uncovered, and with more than ordinary observance, around the prince, and as in attendance on his person. The populace, taking part with fallen royalty, began to express their opinions in tumult; the harsh republican was driven ignominiously from the grounds, and, after being for some time in imminent danger of his life, was glad to accept the protection of the very man whom he had sought so needlessly to offend, and took refuge in the duke's lodging.

The scene of this incident was that really beautiful promenade known to all visitors of the Hague as the *Bosch*, or *Wood*. Magnificent trees are found at intervals throughout the not inconsiderable length of the space; and these, however short may have been your stay in Holland, you will have learned thoroughly to appreciate; deep shadows fall over bright green slopes, their exquisite colour making large amends for that lack of boldness which the nature of the surface renders inevitable: handsome sheets of water vary the character of the whole. If to these be added the widely differing appearance of the personages forming your chief group, the diversified expression proper to each of the actors; to the nearer bystanders, and to the more distant people,—now preparing to repay the discourteous ambassador in his own coin, as exhorted thereto by the energetic fishwoman of Scheveningen, conspicuous by her shadowy head-gear, and coming prominently forward in their foremost ranks,—you will at least not fail of variety in your picture, and may produce a work of which the interest will certainly not be inferior to that of many now occupying space on the walls of our galleries.

When the brilliant courtiers of Philip IV. of Spain did not venture to gaze on his august countenance until they had first mounted spectacles,—“broader,” says the Countess D'Audroy,† “than the palm of my hand,”—a certain marquis, first among the foremost, and who would assuredly not fail to have his glasses of the orthodox amplitude, was pleased to command the erection of a statue to his own honour and glory.

And the sculptor completed his work; but, strange to say, he neglected to place marble spectacles on the nose of the marble hidalgo, and was forthwith “turned back,” as schoolboys have it, to supply the omission. Of his ultimate success the chronicles do not speak: but that the Marquis of Astorga's effigy was duly furnished with spectacles we may not

doubt, although no statue exhibiting such appendage hath met the ken of the writer. In any case, would not the Spanish amateur prove the most zealous of patrons to that sculpture in colours, now menacing ruin to the nobles of the Arts? How would he rejoice in the brilliancy that might now be given to the velvet of his habiliments! how glory in the dazzling glitter that would now be imparted to every jewel in all his orders! Alas for the Marquis of Astorga! why did he live so long before the time?—for do but think of the rare delicacy with which we could now reproduce, for his delectation, that refinement of complexion which it is but civil to conclude that he derived from his indubitable *sangre azul*—the unquestionable “blue blood” of his race!

But the subject is after all scarcely fit to be laughed at—nay, rather, since this deplorable innovation is to a certain extent sanctioned by an authority so much respected as is our admirable Gibson, we are compelled to treat it with the utmost seriousness. Not that all one's admiration for the artist can blind one to the fallacy of his reasonings on this subject; nay, even while listening to his zealous defence of the new theories—or newly revived, for we do not here enter into any discussion of that question—you feel more than ever rooted in your attachment to the old ones. The delicacy and reserve with which the Sculptor has applied his theory to practice, in such specimens of the new manner as we have seen in his Roman studio and other places, could not render us unfaithful for one moment to our earlier loves among his previous works; on the contrary, the grace and beauty of these last caused us ever more to lament that the earnest speaker should be disposed to adopt a manner which, with all due deference to his judgment, we could not but think a mistaken one, both for his own fame and the future delight of the world in his works.

Among the first of his productions treated by Gibson in this new or newly-adopted manner, was a statue of the *Venus Victrix*,—if we remember rightly,—the apple lying at her feet, involved,—if our memory do not fail us—amidst the gracefully depending folds of her drapery. That the beauty of the work was not impaired so seriously as we had feared it would be, is a fact not to be denied, and which we distinctly remember. Yet did we return with increased delight to those chaste forms of the artist's earlier day, all but breathing around us, and seeming to reproach their creator for his abandonment of that happier phase in his and their existence, when he had called them into that lovely life, from the cold insensate blocks of their else unmarked abode; we returned with even new delight, I say, to those earlier works; and when reluctantly leaving them, after long and repeated contemplation, it was with the conviction fully confirmed that Sculpture, as the great old masters presented her to the love and worship of all times, late and early, does indeed need nought from the “foreign grace of ornament,” but *is*, “when least adorned, adorned the most.”

If then there be any among our aspirants doubting whether it be desirable to adopt the new method, let him be assured that colour is not for the purposes of the Sculptor; for since, even in the hands of Gibson, the addition, though admitted only with the utmost reserve, and applied with an exquisite delicacy, is yet no improvement—to use the gentlest form of phrase permitted by truth—what would you look to find it in hands less competent, under treatment less refined? Do not your most cherished recollections combine to warn you of the perilsous venture? would you suffer a pair of blue eyes to glimmer from beneath the veil of *Vesta*? or have you any mind to affix black locks to the head of *Apollo Delphicus*?

I know it may be said that no such enormities are contemplated; well, they are not; but beware the sharp end of the wedge, never does it fail to bring the broad one in its train, and be sure that a law so general will be held inviolate, here as elsewhere.

Do you then hold fast to the practice as it has been, whether that be of the oldest or not; evoke from the willing stone those proud and beauteous forms wherewith your imagination is doubtless ever teeming, but eschew the desecration of colour; let the Marquis of Astorga rejoice in the glories thereof, with those of his spectacles, if so it please him, but do you content yourself with the purity of the marble.

* Speaking of the Protector's funeral, Evelyn says, “This was the merriest funeral I ever saw; no one howled but the dogs, with which the soldiers made barbarous sport.”

† See “Voyage en Espagne,” Lettre viii.

Here, for example, is a group which would by no means be embellished by colour; you will find it in some one among those masses of marble awaiting the moment of inspiration in the recesses of your studio—provided only you do not seek it until the propitious day has dawned upon you. One of the loveliest of the Corycides is that nymph with her sweet, imploring looks, and graceful attitude of such entreaty as one immortal may address to another.*

She has risen to a certain height on the sacred mountain, at the foot whereof is her birth-place, and meets Apollo Ismenius, as he descends to that temple of Boetia whence the name he bears. The god is looking with approval on her beauty, as you see well, and she beseeches him to endow the lyre in her hands, and which she holds towards him, with such perfection of tone as may render it worthy to sound his praise. That Apollo will grant her prayer is made manifest by the expression on that god-like brow, and on the fine arch of his lips; but let there be no rumour of colour in the air, lest your visitants, seeking defence from that outrage to their divinity, should return to their refuge in the sheltering stone.

Or say you give us the fairest of the Oreads, as she prepares to join in attendance on the Delian huntress; beautiful are the free limbs appearing from beneath her high-looped tunic; full of spirit is her action, as, holding the well-filled quiver in one hand, she throws its fillet over her firm and rounded shoulder with the other; her bow, which she will presently resume, laid beside her on the earth. Elastic will be the bounding step of the Oread on the dewy glades she prepares to traverse, and glad some is the expression of the full but sweet and chastened lips, half opening as about to give utterance to the joy of her heart, as the sports awaiting her rise, with all their genial delights, to her thought.

Or suppose you take the brilliant Maia for your theme: whether, as the most luminous of the Pleiades, you present her alone and star-crowned, or, approaching her as one of the Camenæ,—all but immortal,—you engage us to wait reverently and in silence while her votaries offer sacrifice. And these last, should your intent be the more ambitious one, will aid you effectually to form such a group as might be worthy of a temple fairer than aught now reared by man. For in this case you will invest the daughter of Atlas with her most imposing dignity, and the shepherd about to present his offering must exhibit all the perfections of youth, strength, and beauty. The victim offered may be a kid, sporting playfully with the flowers that mark his doom; or a lamb, caressing the fingers that have bound him for the sacrifice. Or, if you hold them more appropriate, let your shepherd-boy bring flowers only, or the produce of his hives instead—since of these, or of gifts yet more simple, were the offerings most commonly made to the nymphs.

Yet I incline for this occasion to the more important offering, for see, there leans upon the shoulder of the youth, a man whom age, or some malignant influence, has robbed of his pristine force; it is for him that the boy implores the favour of Maia—and affection offers no niggard gift. It may perchance be length of life that the elder votary seeks at her hands, and in that case he would make ample sacrifice, attributing to the Camenæ such power to prolong the days of her worshipper as might content the desires of him who best loves life; since he knows that she may confer any length of existence short of that accorded to herself; and of this, what says Hesiod, or rather, what sing the swains to whom he listens when the flocks are in the fold:—

“Nine times the life of the oldest man have the gods assigned to be the life of the Crow; four times longer than the crow lives the Stag; three times the life of the stag is that of the Raven; to the Phoenix is granted nine times the life of the Raven, and ten times do the Nymphs outlive the Phoenix.” The boon our shepherd is asking may be thus of no trifling moment, and in proportion must be the sacrifice, but not even here must you endure the presence of colour—no, not though it were but to lend the faintest of hues to the smallest of the blossoms that your votaries have twined around the neck of their offering.

* If the nymphs are not immortal, in the strict sense of the term, they are sufficiently so for the purposes of the artist.

CORRESPONDENCE

FROM THE
UNITED STATES.

[For a long time past we have been anxious to cultivate a closer intimacy with the Artists and Art-producers of the United States; believing that by so doing we may essentially promote the interests of this country, as well of the people on the other side the Atlantic. If our language is the same, so is our Art also, to a great degree; and whenever the Art of the one is promoted, that of the other is advanced. The ART-JOURNAL has obtained extensive circulation in the United States; and we receive abundant proofs of the service it has there rendered: we do not expect that by frequent communication to the English reader as to the progress of Art in America we can effect as large an amount of good; but we feel sure that occasional reports, while they cannot fail to be interesting, may be at the same time instructive; and we shall rejoice if we find means to draw nearer and closer those relations that must be of advantage to both,—by cultivating the Arts of peace, which are at all times a safeguard against disunion.]

We shall therefore, we hope, be enabled from time to time to report duly and with integrity the progress of Art, Fine and Industrial, in the United States; conveying useful information to all classes of readers in Great Britain, on the continent of Europe, and in America. We have no doubt that by the aid of competent associates, we shall thus add much of interest and value to our Journal while rightly representing the progress of a great people, who in Art, as in all things else, are making rapid advances to perfection. Meanwhile, we print the first communication we have obtained: pledging ourselves, as far as we can, for the accuracy and integrity of the views and statements of our able and experienced Correspondent.]

DEAR SIR,—I am very glad that the substantial proof which you have received of the good and growing estimation of your beautiful JOURNAL on this side of the water, has awakened so lively an interest among you in respect to the condition of our public taste. The subject, I assure you, well merits all the study which you seem disposed to devote to it; and for my own part, I shall certainly be most happy to assist your inquiry with all the propulsion and power of the heartiest sympathy, and not a little fair opportunity. You may therefore rely upon me as a faithful sentinel, ever watchful for every information and intimation which may help in the wisest disposition of the forces you can send to fight with us, under the banner of the Beautiful, against that great gothic Attila—*Utilitarianism*, which has overrun, and overrules, our country. Assuredly the strength is hers, however scattered and inactive, for much and true Art achievement; and the good time is, I hope, not far distant, when, with earnest and persistent battle, the present gross and glaring materiality of popular feeling shall be toned and sweetened in the softening shadows of our victorious flag.

We have good soldiers already in the field, and better buckling on their armour, with patriot-prayer and voice enough to second and cheer them on their way. Here, as in other of our larger cities, we have brave regiments of Artists, which, rough troops though they be, for the most part, need only discipline and organisation to become a manifest and conquering power in society; while every hamlet within the three points of our political triangle—Maine, Texas, and California—has its humble recruiting office in the shape of some little still-voiced studio. Academies of Art, such as they are—and they might be worse and will be better—are growing up about us; and within the circle of a day's journey from my *sanctum*, there are annually held half a dozen very considerable reviews of new, original “works,” which the people flock lovingly to see; while but few good pictures, after all the lamentation, go “a begging” for liberal purchasers. Not long ago, one esteemed landscapeist, Cropsey (who will have taken up his temporary abode amongst you—to your gratification and our regret—by the time this despatch arrives), sold his accumulated pictures, sketches, and scraps, at public auction, and realised

willing thousands where only dubious hundreds had been predicted.

But, returning to the ranks; it is the portrait-painters who are at present doing most execution—taking off the heads of the people; oftentimes, it must be confessed, cruelly enough. And after this irresistible infantry, there comes the light cavalry of the landscapeists, successfully carrying Birnam Wood to Dunsinane! What we are most wanting, unfortunately, is the heavy ordinance of history, though now and then a big gun bangs away triumphantly. Mr. Edwin White has lately discharged such a piece effectively, in the shape of an admirable picture of the “Pilgrims signing the compact in the cabin of the May-flower;” Mr. H. P. Gray, another, in a charming “Hagar;” and Mr. J. K. Brown, one of our most able sculptors—though he lives in Brooklyn instead of Florence or Rome—is at this moment erecting a battery in Union Square, from which he will take the town by storm on the coming 4th of July; for he is going to do nothing less than to trot out General Washington himself, mounted on his war-horse, and both grand in bronzed bravery. I must though be serious here for a moment, as the subject is important. A few years ago some liberal-hearted private citizen made up a generous purse to procure for the city a colossal equestrian statue of the country's idol. The commission was entrusted to the joint care of Mr. Greenough and Mr. Brown. The lamented death of the former left the task to his colleague alone, and he has accomplished it with a success of which I shall speak hereafter.

I shall endeavour to advise you in regard to our Art-history, with all profitable observation of present performance, and peep backwards when opportunity may come. At this moment I have sought only to report myself ready for service as your Correspondent here.

Very sincerely yours,

T. A. R.

New York, June 6, 1856.

DEAR SIR,—I am afraid that it was very rash—the promise which I lately made you, to watch the wide and varied course of Art, *Æsthetic* and Useful, in this great land. The labour grows into most grave magnitude as I come near to it; and I might even now be tempted to shrink from the task, did I not feel its vast importance and worth,—and were it not an inexorable dogma of our national faith to go-ahead when once assured you are right!

Before I can intelligibly follow the daily progress in our studios and manufactories, I must inquire, briefly as may be, into their past and present fortunes. Such a review I shall have an admirable opportunity of making during the coming summer months—the annual interregnum in Art-production; when the ateliers are closed, and their occupants, as the cards on their doors intimate, are “out of town,” consulting with the great teacher, Nature, as to their future toils.

In this note I propose to give you such information about the Arts here, as you may be able to gather from a knowledge of their money value in the higher departments. I am very sorry thus to begin with the all-mighty dollar, but it is the truest standard; and whatever “figure” we, as well as you, might cut, would still be but a miserable one, unless led by the magic “\$,” or by the “*£. s. d.*” As with all other things, so with Art—to know whether it “pays,” is to know whether it prospers.

However diffused the political power in the United States may be, the Art-strength clearly tends towards centralisation, and that, in this our chief metropolis, with a partial exception in respect to portraiture, and in a few notable instances in other departments. At least no more can be said of other cities than of this, which may thus speak fairly for all the rest. In our population of half a million there are scarcely less than from five to six hundred painters, sculptors, and engravers, who live solely by the practice of their professions. The greater portion, of course, are men of very moderate ability, and only very moderately known to fame. The “works” of nearly two hundred are from time to time admitted upon the walls of our Academy Exhibitions, and half of these might be entirely excluded with great advantage, while the productions of a yet smaller number only are desirable. The highest prices paid for

portraits—and which but few command—are from one hundred and fifty to two hundred dollars for a head, from two hundred to two hundred and fifty with hands, and five hundred and one thousand dollars respectively for half and full-lengths: five hundred and one thousand dollars were once the official prices paid by our city authorities for the portraits of the retiring mayors and state governors, but these fees have, within a few years, been reduced to exactly one half. The painters of course disapproved of this economy, and one of them, when coaxed to compromise the matter, by “doing only what he could afford for the price,” grew merry at the order (as he said) for “five hundred dollars-worth of governor!” The corporation, alas! won the day, and their price-current still controls the market. The only retaliation within the power of the artists, and which some of them unfortunately seem careful to make, is not to give *more* than the worth of the moucy.

When our “city fathers” once upon a time desired Mr. Ex-President Van Buren to sit for his portrait on their account, and to select the artist himself, he went of course to the studio of the late Henry Inman, the leading painter of his time. His work completed, Inman presented his bill, one thousand dollars, to the authorities. The price was disputed; whereupon the artist coolly replied that it was of no consequence, as since they declined to pay he would send the account to his sitter, who had ordered the picture. It need not be added that the municipal purse-strings were very speedily loosened. This half-price business is in strict keeping with our government estimation and patronage of Art—excepting only in the instances of the national commissions of ten thousand dollars each, for the eight large historical compositions in the rotunda of the Capitol at Washington, and of a few works of statuary there and elsewhere.

In landscape—the department in which is, and for many years to come will continue to be, our chief Art-strength and hope—the prices received by some half-dozen of our best men range from fifty to one hundred dollars for a study, or a small picture, to five hundred for a canvas four feet by six—the maximum landscape dimensions here: a few works of this size are sold for one thousand dollars, and occasionally for yet larger sums.

The prices of historical and genre-pictures—of which we have comparatively few—run very little above those paid for landscapes. There are in the possession of gentlemen in this State two very large pictures by Leutze, purchased each at the cost of ten thousand dollars.

The collections of the late American Art-Union were purchased at the rates I have indicated. I am speaking now only of the works of a few of the most popular painters—and they are not all overburdened with orders. No fortunes are yet made here at the easel. Two or three thousand dollars a year is a successful income, and five thousand is a marvel. The purchasers of pictures are few in number as yet, and their means are limited. Others will by-and-by be paid for the toil of the artists of to-day—by-and-by, when their works will be resold at double and treble the prices they themselves receive. Of this there is clear indication in the greatly advanced value of good pictures of the past, as they come from time to time under the auctioneer's hammer. The last yearly collection of the American Art-Union, when thus sold—the law having forbidden its distribution by lot as before—brought almost the liberal amount at which it was purchased. I recall here the instance of a certain little picture, which was recently bought by a distinguished gentleman in Washington at ten times the price which the painter received not very long before.

Is there not in all this, promise that the true love of Art lives among us; and that in due season, and under proper circumstances, it will become gloriously manifest?—that with the daily increasing means for the gratification of daily advancing taste, the public estimation and support of the higher Arts will soon grow, even in a greater ratio of progress than that already made in the more useful and practical departments? May not the young men of to-day, even, hope to gather their share of the ripening harvest?

But to leave this agreeable future, and to come back to the less inviting present, of which labour and patient waiting are the watchwords. While we

have amongst us, happily, a few gentleman who buy pictures simply for the love they bear them, certainly as yet the greater number of our connoisseurs look only to the vain pleasure of a showy and costly decoration of their parlours and halls; ordering works of Art for this and that especial niche and nook, in precisely the same spirit in which they order fresco flowers and angels for their ceilings, and carpets for their floors. Thus the Art in our drawing-rooms is always well-displayed, and never thrown away in portfolios, unless it be in expensive engravings. Little hidden treasures, which do not astonish the vulgar gaze, and thus minister to the idle vanity and pride of their possessors, are looked upon as unprofitable extravagance. So we have no works and no painters in water-colours, and cannot for the present hope to have any; though a beginning has been made even in this, by a little society of hopeful labourers, from whom we shall, I trust, have good reports before long.

We have very successful annual exhibitions in this and the neighbouring cities of Philadelphia and Boston; and as I write, vigorous efforts are being made to establish a similar gallery in Baltimore. The collections of the National Academy of Design, in New York, are the only ones entirely renewed each season. They have now continued without interruption through thirty-one years—the catalogues numbering from four to five hundred items, and the receipts varying from three to five thousand dollars per season of six or eight weeks. In 1826, the first year, the exhibitors were themselves called upon to pay, *pro rata*, the costs of the exhibition; during the second season (1827) over five hundred dollars came into the treasury; and ten years later (1837) a no less sum than six thousand two hundred and seventy-eight dollars was received from visitors. Since that time the income greatly decreased; but during the past three years has been gradually coming up again. The financial condition of the Academy was greatly improved recently by an advantageous sale of its galleries; and its real and personal property now amounts (without debt) to about one hundred thousand dollars. The available means are soon to be re-employed in the erection of new and more commodious buildings.

Besides the annual exhibitions of the Academy, we possess an excellent beginning of a permanent collection of American pictures, established some years ago under the name of the New York Gallery of Fine Arts. It is closed temporarily from the want of suitable exhibition rooms. Next we have, and have had for a number of years, a collection of German pictures—some hundred and fifty in number—known as the Düsseldorf Gallery. These pictures, which are fair examples of the school to which they belong, were very popular when first exhibited; and with some ups and downs they have kept their place in public favour to the present moment. During the past year the receipts of the Düsseldorf Gallery have averaged about twenty-five dollars per day. The fourth and last permanent exhibition in New York is the Bryan Gallery of Christian Art, a very excellent and most interesting collection of old pictures. But our people do not much affect the old masters (except when they can plaster their walls with them at a cheap rate), and so Mr. Bryan's pictures are displayed chiefly at his own private cost.

For a number of years the attractive and ever-changing galleries of our late Art-Union were a favourite and always thronged resort of all classes of our population.

Besides the exhibitions proper, we see a great many works of Art in the shops of our frame-makers and colourmen. Messrs. Williams, Stevens, and Williams, always make an attractive display at their large and elegant establishment in Broadway, giving us from time to time peeps at the works of your own artists. Just opposite to them is the well-appointed store of Goupil and Company, where we occasionally obtain sight of a Delaroche, a Vernet, a Scheffer, and other pictures of the French school.

The receipts of the Pennsylvania Academy, in Philadelphia, hardly fall below our own. In 1851 the gross income of sixty-four days amounted to four thousand six hundred and two dollars and seventy-one cents; while that of the current exhibition (the thirty-third) is still larger—more than three thousand dollars having been received during the first thirty-six days. This, too, with the deduction of

about six hundred free family-tickets issued to stockholders—for the Pennsylvania Academy, unlike the National Academy, is a joint-stock institution, controlled by lay as well as by professional members. The real and personal estate of the Pennsylvania Academy (invested in admirable buildings for exhibitions and schools, and in a permanent collection of pictures and statuary) amounts to one hundred and thirty thousand dollars, with a venerable debt of thirteen thousand.

The only gallery supported in Boston is that of the Athenæum—a permanent and an annual exhibition united, as in Philadelphia. The receipts last season were four thousand four hundred and forty-three dollars and thirty cents, an income very much exceeding, thus far, their present year.

In each of the three cities of which I have spoken there is a respectable Art-library, and free schools for the study of the antique and the living model. At the National Academy the roll of students varies in number from twenty to sixty.

One very important means for Art-development, in which we are unhappily quite wanting, is a well-informed and honest criticism.

A few of the leaders of Art-opinions here, who really seem disposed to be honest, have unhappily fallen of late into a most lamentable misunderstanding of the true spirit of the reform in Art which in England you have called Pre-Raphaelism; and instead of urging upon us the importance of that more rigid discipline of eye and hand—that more faithful study of Nature, and that more careful and patient manipulation, which we really so much need, they insist that we shall absolutely eschew all imagination, all poetry, all feeling, and be slavish imitators of Nature, with no presumptuous preference of her beauties—no choice between “a miller and a mountain.”

I forgot to mention in my last letter that it would be accompanied in its voyage across seas by Professor Morse, the illustrious inventor of the electric telegraph. The artists here are especially proud of Professor Morse, as he has successfully gone out, like Fulton, from their own ranks into the world of practical scientific achievement. He was the founder, and for twenty years the President, of our National Academy, which office he resigned only when he found himself entirely withdrawn from the profession into other labours. Notwithstanding his triumphs elsewhere, I am sure that he sometimes looks back regretfully to the long years of his former artist-life. Indeed, I once heard him say, at one of our Academy *réunions*, when it was lamented that he so rarely visited the exhibition, “That such visits were always painful to him, as he never found himself among pictures and painters without feeling very much like one who comes into the presence of an old love in the possession of another!”

I am very sincerely yours,

T. A. R.

New York, June 21, 1856.

CORRESPONDENCE.

To the Editor of “THE ART-JOURNAL.”

MILLAIS' “BLIND GIRL.”

SIR,—Last year I had occasion to direct attention to the violation of truth in Mr. Millais' picture of “The Rescue,” in which it will be remembered a monochromatic red light was diffused over the picture, though, in reality, the flames of burning wood emit yellow and green rays in abundance. A yet more glaring want of attention to natural phenomena is observable in “The Blind Girl,” by the same artist, exhibited this year. The story of the sightless girl is told by the introduction of a rainbow, which, with its very beautiful play of colours, is delighting the younger girl, who is blessed with sight. Not only is the primary bow represented, but the complementary bow is also shown. If Mr. Millais had looked at a rainbow, and its complementary arc, he would not have painted both the colours in the same order, as he has done. Let him observe, when next he has an opportunity, and he will find that the order of the colours in the complementary bow is the reverse of the order which prevails in the primary rainbow. Surely, with all the boasted attention of this school to the truth of Nature, such errors as those which I have pointed out should not have been committed. I am, &c.

CHROMAS.

BRITISH ARTISTS: THEIR STYLE AND CHARACTER.

WITH ENGRAVED ILLUSTRATIONS.

NO. XVII.—WILLIAM POWELL FRITH, R.A.

LOOKING at the histories of the various schools of painting since the revival of Art, it may be affirmed without much fear of contradiction that not one presents a parallel ease of rapid improvement to our own. It occupied the Italians three centuries, from the thirteenth to the fifteenth, to develop their school, and another century firmly to establish it. The Spanish school, commencing about the middle of the fifteenth century, reached its climax, in the works of Murillo and Velasquez, towards the close of the seventeenth. That of the Flemings and Dutch, which bear so close a resemblance, and therefore may be coupled together, began in the middle of the fifteenth century, and attained its highest point about the end of the seventeenth.

The foundation of the French school was laid early in the seventeenth century; and though it has at present neither a Nicholas Poussin nor a Claude, it can scarcely be said to be on its decline.

Till the latter part of the last century England had no school of painting; and in fact till the appearance of Hogarth, who died in 1764, she had no artist of any eminence, except the portrait-painters of the reign of Charles I.—Cooper, Dobson, and Oliver. But the founders of our school—Reynolds, Wilson, Gainsborough, Barry, Northcote, Opie, Romney, &c.—some of whom were

living at the commencement of the present century, were the pioneers of a numerous and successful body of artists, whose works, except in the department of history, will bear comparison with those of any age or country. Fifty

years have sufficed to place England on a level with the best Art-epoch of the Continent; for if we have not produced a Raffaele, a Guido, or a Leonardo da Vinci, it ought to be borne in mind that we have exhibited a greater diversity of talent and more originality than the most famous schools of Italy ever sent forth. If we are behind all others in historical painting, it is the result of circumstances rather than of any deficiency of talent: as we have often had occasion to remark, where there is no demand there can be no reasonable expectation of a supply; this has been, and still is, in a great degree, the case with us. Italy, throughout her long period of artistic excellence, required little else than the representations of saints, and martyrs, and sacred history—consequently the talents of her painters were limited to such subjects; and we may trace throughout the whole of their works more or less resemblance to those who preceded them. Protestantism effected almost as wondrous a change in Art as in religious forms and ceremonies. It opened a wider field for the talents of the painter; and as the doctrines of Calvin and Luther soon spread over the Low Countries, there arose in them the numerous classes of landscape and genre-painters who have served more or less as models for those of our own school. The artists of France have found few imitators among ourselves—we cannot call to mind a single example of a British painter so closely adopting the style of any French artist as to be recognised as his copyist, or even follower; and although we have seen pictures by Turner which have been, and not inappropriately, likened to those of Claude and Nicholas Poussin respectively, no one, we presume, would call Turner an imitator of either.

What sacred and legendary Art suggested to the schools of Italy, the manners and customs of their country to those of Holland and Flanders, our own painters have found, to a very considerable extent, in English literature; less perhaps in our history than in works of fiction, much of which, however, possesses the character of fact. British Art has drawn largely, though not deeply, from the writings of the dramatist and the novelist—so largely and with such constant repetition as to render it desirable they should seek elsewhere, or in some new channel, for such fountains of inspiration as they stand in need of. Our prose writers and our poets are far from exhausted, nor would we have them neglected, but we should like to see the treasure-hunter looking deeper than the surface, and into springs that have not yet lost all their freshness, or,

THE VILLAGE PASTOR.

[J. and G. P. Nicholls.

in other words, if their reading were more discursive their pictures would exhibit greater originality. Shakspeare and Goldsmith, Sterne, Scott, and Byron, have been "on duty" during the last quarter of a century. It is quite time they were relieved. We do not intend these remarks as applicable especially to the artist whose works we are about to introduce to the reader: they refer to our genre-painters generally, of whom Mr. Frith is one, but one also far less amenable to our strictures than the majority of his compeers; particularly in the works he has exhibited within the last four years.

William Powell Frith, R.A., was born in 1819, at Studley, a village near Ripon, in Yorkshire. His father, a man of taste, and an enthusiastic lover of Art, encouraged in his son the earliest indications of the talent which it was evident the boy possessed; every opportunity was afforded him to copy the best pictures and prints that came within reach, and thus the groundwork of future success was laid without any of those obstacles which so frequently impede the progress of the young artist. The father desired to see his child grow up to be a great painter; the prospect of his arriving at excellence

was the darling hope of the parent, who, unhappily, did not live to witness his success, as he was removed by death when the lad had scarcely reached his sixteenth year. The loss did not, however, affect the career of the young artist; he continued his elementary studies, and in 1835 was placed in the Art-academy in Bloomsbury Street, then conducted by Mr. Sass, and now by Mr. F. S. Cary, from whose schools many of our most esteemed painters, and several who have gained distinguished rank at the Royal Academy, have come forth. During the three years Frith continued here, his aim was to perfect himself in drawing and the art of composition, well knowing that these must ever be considered the primary elements of a good artist. To colouring he paid comparatively little attention. In 1839 he exhibited at the British Institution his first picture, a small portrait of one of Mr. Sass's children; and to the same gallery, in the following year, "Othello and Desdemona," of which at the time we thus spoke:—"The artist's name is not a familiar one; if he be young" (he was then twenty-one) "he will ere long produce works of a much higher character. His groundwork is safely laid. He has given us a proof that he thinks while he labours." Mr. Frith made in this year his first appearance within the walls of the Academy by his contribution of a picture representing "Malvolio before the Countess Olivia," a subject which Maclise has so ably portrayed in

the picture now in the Vernon Collection. In 1841 he sent two pictures to the Academy, one a portrait, the other "The parting Interview of Leicester and Amy," as narrated in Scott's "Kenilworth," a composition in which the characters are very faithfully delineated. In the British Institution, in 1842, he had one picture, but it was so unfavourably placed that those who only saw it in the gallery must have formed a very inadequate idea of its merits. The subject is from Sterne's "Sentimental Journey," where the traveller feels the pulse of the attractive French *modiste*, and receives the gracious acknowledgment of her husband for his attention. The picture is elaborately finished, and elegant in conception; nor did we prove a false prophet when, after seeing it—but elsewhere than in the gallery—we wrote:—"A time will come, and that as surely as we now write the sentence, when the painter will obtain the most distinguished station in any collection of the works of British artists." Mr. Frith's solitary contribution to the Academy Exhibition of the same year was also an illustration of a passage from one of our Novelists—Goldsmith, whose "Vicar of Wakefield" has perhaps proved a more profitable mine of wealth to the painters of our school than any other tale that was ever written. The scene he selected is that where, at the suggestion of Mrs. Primrose, Olivia and the Squire are standing up, *dos-à-dos*, to ascertain which is the taller. Other characters, the

SCENE FROM THE "BOURGEOIS GENTILHOMME."

[J. and G. P. Nicholls.

Vicar and the younger members of his family, are also introduced into the work, forming a group of exceeding interest, each one of whom seems to be the veritable personage drawn by Goldsmith. The picture was purchased on the day of opening the exhibition.

Of the two pictures sent by Frith to the British Institution in 1843, one—"Dolly Varden," from Dickens's "Barnaby Rudge"—is too well-known by the engraving executed from it to require description; the other, the "Duel Scene," in the play of "Twelfth Night," had been exhibited the preceding year at the Gallery of the Birmingham Society of Artists, where it soon found a purchaser. The subject had evidently been well studied, and the characters are placed on the canvas most faithfully—perhaps a little too much so; for the disinclination which the combatants exhibit to enter the lists is rather too conspicuous—they both appear such absolute cowards that it seems absurd to suppose they will ever cross swords. His single contribution to the Academy this year was also a subject from Shakspeare—"Falstaff and his Friends with the Merry Wives of Windsor." The picture, like one we have just adverted to, was so wretchedly hung, in the den called the "Octagon Room," that it was impossible to see it. The fat knight and the comely damsels have often been the themes of our artists, but we have rarely seen them more successfully represented than in this admirable work.

Mr. Frith's pictures of 1844, were two only, and both of them in the Royal Academy; one "An Interview between Knox and Mary, Queen of Scots, respecting her marriage with Darnley;" the subject is one not suited to the powers of this artist, though the character of the stern Reformer is well sustained, and that of Mary Stuart, represented in a passionate burst of grief at the remonstrances of Knox, is scarcely less so; but the composition does not come well together as a whole. The other picture, though an oft-repeated subject, pleased us better as a work of Art; it is a scene from our old acquaintance the "Vicar of Wakefield"—the Squire describing to Mrs. Primrose and her two daughters sundry passages of his town-life; like all the young female heads painted by Frith, those of the two girls in this picture are very sweet and beautiful; his finish is just enough to produce delicacy of texture without that over-elaboration, the result of which is, very generally, *wooliness*, and oftentimes a refinement quite contrary to nature.

"Sterne in the Shop of the Grisette," is the title of a little picture exhibited at the British Institution in 1845; it offers some valuable artistic qualities, but must not be compared with other works by the same hand. In the Royal Academy he had a "Portrait" of a young lady, sweet and elegant in expression; and the "VILLAGE PASTOR," which forms the subject of one of our

illustrations; it has been engraved on a large scale by F. Holl, and is deservedly one of the most popular prints published within the last three or four years. The readers of Goldsmith's "Deserted Village," will easily recall to mind the lines selected by the artist for illustration, though the numerous incidents he has introduced into the composition render it rather the epitome of the entire poem than the embodiment of a solitary passage. We have often wished, when looking at this deeply interesting picture, that some other figure had been substituted for the consumptive girl: it is so perfectly true a realisation as to produce pain in any mind, though such mind may not be over-sensitive. The picture was the means of placing the artist on the roll of Associates of the Royal Academy, to which he was elected in the autumn of the year.

In 1846 he exhibited at the British Institution a small figure-subject, "Norah Creina," engraved in Finden's "Beauties of Moore;" and at the Academy "The Return from Labour," and a scene from Molière's "Bourgeois Gentilhomme;" both of these were novel subjects from his pencil, especially the former, while the treatment of this varied so much from the painter's usual style, that we remember to have found it difficult to ascribe the work to his hand. The subject is an inverse reading of the lines in Gray's "Elegy":—

"No child: I run to kiss their sire's return,
Or climb his knees the envied kiss to share."

Accordingly the artist has represented the interior of a cottage, to which a labourer has returned from his daily toil; his children are running to meet him at the door. The most successful study in the composition is an old dame, the grandmother of the youngsters, it is presumed. The scene from the French comedy, "Madame Jourdain discovering her Husband at the dinner he gave to the Belle Marquise and Count Doranto," will, we believe, take rank with the best dramatic pictures of the English school, so pointedly and effectively is each of the characters brought forward; the artist, ere he painted it, must have very closely studied the *dramatis personæ* of the writer.

Mr. Frith's accession to the lower honours of the Royal Academy induced him, we presume, to discontinue his contributions to the British Institution, for his name has not since appeared in the catalogues of the latter, except in the year 1852, when he sent a small portrait of a girl, under the title of "Wicked Eyes." In 1847 he exhibited at the Academy the largest picture, if we recollect rightly, he had hitherto painted—"English Merry-making a Hundred Years ago," a composition of numerous rustic figures, appropriately costumed in the dresses of the period, and variously engaged in making holiday under and about a huge tree on the village-green, the amplitude of whose branches affords a goodly shade for the principal group in the picture, who are dancing merrily to the music of a violin, pipe, and tabor. The figures are grouped with

SANCHE AND DON QUIXOTE.

[J. and G. P. Nicholls.

very considerable skill, are all full of life, energy, and activity; it is altogether one of the best, if not the best, picture of its class we remember to have seen. His other contribution of the same year, the "Saracen's Head" story from the "Spectator," is a brilliantly-painted work, illustrative of the true spirit of the narrative.

Of all the pictures, however, which this artist has produced, not one in our opinion surpasses, for originality of thought and powerful treatment, the first on the list of three exhibited in 1848—"An Old Woman accused of bewitching a Peasant Girl," in the time of James I. The scene lies in an apartment of a fine old mansion, in which the owner, who is also the justice, sits to hear the accusation; the room is filled with numerous individuals assembled either as curious spectators, or as persons interested in the case. To describe the composition in detail would occupy far more space than we can allow to it; it must suffice that we repeat the opinion we expressed in our critical report of the year, that it is a work exhibiting "a rare combination of genius and industry." The reader must form his own judgment, from the engravings on our pages, of the other pictures hung at the same time:—"A STAGE-COACH ADVENTURE IN 1750," and another scene from Molière's "BOURGEOIS GENTILHOMME," that in which M. Jourdain, dressed in a red coat trimmed with

gold lace, is bowing Dorimène out of the room: the costumes and characters of the two figures are painted with undoubted truth and vigour of touch.

We confess to be so far behind the spirit of our own age as to entertain no inconsiderable share of respect for that of our forefathers two or three centuries back; we love to ramble through old mansions—

"Where steel-clad knights, and dames in rich attire,
The grey-capped yeoman and the obsequious squire,
In crowds were seen, while scarce the ample feast
With closing day its joyous revels ceased."

We like to read of old English customs and manners—of maypoles and rustic entertainments—of the hospitality shown by the noble and wealthy to their dependents; we hold the antiquated notion that landlords and their tenants in those days,—notwithstanding the comparative ignorance of the one with reference to education, and the aristocratic bearing of the other,—somehow were more influenced by mutual feelings of kindness and regard than are now manifested by each respectively. After such an admission, Mr. Frith—and our readers too—will not be surprised to hear us say that we admire his picture of 1849—"Coming of Age"—far beyond those of which we last spoke; it carries us back to the era of the "Virgin Queen," the "golden age" of England, as some not

inappropriately consider the days of Shakspeare, Bacon, Drake, and a host of others eminent in literature, science, and arms. The picture represents the eldest scion of a noble house standing on the steps of a magnificent baronial mansion, his paternal home, and surrounded by his family, to receive the congratulations of his father's tenantry, for whom a substantial repast is being set out in the court-yard. There are upwards of sixty figures introduced into the composition, each one a character carefully studied, and sustaining its individuality no less than its presumed right to be present on such an occasion. Most of our readers have doubtless seen Mr. Holl's fine engraving from the picture, which was presented last year to the subscribers to the Art-Union of Glasgow.

In the Academy Exhibition of 1850 Frith exhibited three pictures: the first on the list, a "Portrait of a Lady," the face in profile, very gracefully drawn and delicately coloured; the second, a subject from "DON QUIXOTE," the passage of the narrative which describes Sancho as telling a tale to the Duke and Duchess, to prove that the Knight of La Mancha is at the bottom of the table. Sancho is placed with his back to the spectator, consequently the interest of the composition is centred in the figures of the duke and duchess, and in that of Don Quixote, who is rising from his seat as if to address his host. There are other personages introduced into the composition—the duke's chaplain, and a group of ladies-in-waiting; the faces of the latter, as in all Frith's pictures, possessing charms enough to woo an anchorite from his cloister. The third picture of this year was selected from Goldsmith's "Good-Natured Man," Mr. Honeywood introducing the bailiffs to Miss Richland as his friends: the work has numerous points of excellence in character and execution, but the subject is not agreeable to our taste, and however clever the artist has proved himself in delineating the emissaries of the sponging-house, his natural genius is too refined, and of too high an order, to exercise it on such persons without manifest disadvantage to himself: every painter should study "things of good report" rather than those of a contrary nature.

"Hogarth brought before the Governor of Calais as a Spy," one of two pictures exhibited by Frith in 1851, is among the best works of its class that the British School has produced. The story, derived from Horace Walpole's letters, is most dramatically and truthfully told, and with great originality of conception and power of treatment. Poor Hogarth has been seized by French soldiers while in the act of making a sketch of some picturesque locality in the neighbourhood, his captors mistaking him for an English engineer drawing a plan of the town; in the picture he is represented as offering to show his sketches to the governor. The room in which the examination is conducted is filled with a large crowd of individuals, all of them exhibiting much interest in the proceedings. There was also in the gallery a pretty little picture of a pretty little "Gleaner" by Frith, the landscape painted by Creswick.

Of the four pictures exhibited by this painter in 1852 two were female portraits, another a "Child repeating to its Mother her Evening Prayer"—a sweet and unaffected composition, and the fourth, "Pope makes love to Lady

Mary Wortley Montagu." In this year Mr. Frith was elevated to the full honours of the Academy.

The following year his name did not appear in the list of exhibitors, but he amply compensated for his absence by contributing five pictures—the largest number he had ever exhibited at one time—to the Academy in 1854. One of these, "Life at the Sea-Side," for variety of incident and character is doubtless one of the most remarkable pictures of modern times, as it was unquestionably the great point of attraction in the gallery where it hung. The subject presents difficulties which required no little amount of ingenuity and delicacy of feeling to overcome without degenerating into caricature; but there is nowhere the least approach to this quality, although an abundance of humour and character. Our space will not permit us to enter into details, nor is it necessary we should, for we apprehend few of our readers who visited the Academy have it not vividly in their recollection. The picture was purchased, when on the easel, by Messrs. Lloyd Brothers, the print publishers, but when the Queen saw it on visiting the Academy, Her Majesty at once expressed a desire to

possess it; but ascertaining that it was already sold, Her Majesty commissioned Mr. Frith to paint another. Messrs. Lloyd, however, hearing of the facts, relinquished their title to the work under conditions not unfavourable to themselves, and the picture is now royal property; the Queen allowing Messrs. Lloyd to have it for a time, that it might be engraved. Mr. C. W. Sharpe, to whom it was entrusted, is rapidly advancing with the plate—a very large one; it will make an admirable companion to Holl's "Coming of Age," of which we have just spoken.

But we have almost exhausted our limits, and must hasten on just to enumerate—for we can do no more—the remaining pictures painted and exhibited by this artist; the other four contributed in 1854 were "Anne Page," a portrait, we think, so designated; "The Love Token," a scene from the "Bride of Lammermoor"—Lady Ashton cutting the ribbon asunder, and offering the bro-

ken piece of gold to Ravenswood; "The Poison Cup," from "Kenilworth"—the daughter of Foster about to drink the draught intended for Amy Robsart; and a "Portrait of Mrs. E. M. Ward." In 1855 he sent an illustration of a scene in Twelfth Night—"Maria tricks Malvolio," "Lovers," "A Lady at the Opera," and "Feeding the Calves," in which Frith painted the figure, a country girl, and Ansell the animals. Frith's pictures of the present year are, "A Dream of the Future," in which he was aided in the landscape by Creswick, "Many Happy Returns of the Day," and "Garden Flowers." We have so recently spoken of all these works as to render further comment superfluous.

Our notice of this accomplished artist is little else than a *catalogue raisonné* of his productions; but what more can be done in so small a space as that to which we are restricted, with such a subject and with such an abundance and variety of materials? Happily, we are not, however, writing of a dead painter, or of one whose pictures are but little known—thousands have seen and admired them; and through many years to come, we trust—for Mr. Frith has yet scarcely reached the prime of life—thousands will have the opportunity of witnessing what, year by year, he may produce for their intellectual gratification.

Engraved by]

A STAGE-COACH ADVENTURE IN 1750.

[J. and G. P. Nicholls.

WOOD CARVING BY MACHINERY.

WHEN the artist has created a beautiful form, there is a desire on all sides to multiply it, with every perfection faithfully preserved. If the mind from which the image sprang could bend itself to the task of reproduction, and if—which is always questionable—the artist could preserve the speaking details of his first work, the labour so expended could only be remunerated at great cost. If the work of reproduction is entrusted to other hands, a copy mechanically perfect may be the result, but the *feeling* vanishes; and, even then, the charge for labour renders the work too costly, and it is only the wealthy who can possess the admired creation of the artist's mind.

Mechanical minds have, from time to time, directed their attention to the construction of machines by which facsimiles of statues and other carved objects in stone or wood could be produced. Several such machines have been invented: the illustrious Watt constructed one, and made many copies of pieces of statuary, which are reported to have been of much excellence. Several small machines of great merit have been constructed for seal-engraving, cameo-cutting, and similar objects; and one, devised by Mr. Cheverton, is now worked for the purposes of multiplying reduced copies of the works of the sculptor. We have, on a former occasion, drawn attention to, and described (*Art-Union Journal*, 1848), Jordan's patent for carving by machinery; and it is with much satisfaction that we feel called upon, by circumstances of peculiar interest, to devote a portion of our space to a further consideration of this important invention. For some time past, although the machines have been constantly employed by the Government for the purpose of executing the work required for the Palace of Westminster, the business of the wood-carving establishment has been somewhat diverted from its original channel into others which were, commercially, of more pressing importance. The Art element has been clouded by the commercial one. In fact, in the manufacture of gun-stocks, under the pressing demands of the war, a large business has been done. From the facility with which repetitions of the same pattern can be made, nothing can be more perfect than the way in which those carving-machines make the stocks, and cut out all those parts necessary for fitting on the locks and barrels.

The war is over, and in our repose from the excitements necessarily attending the conflict of great nations, we are turning our attention again to the advancement of all the Arts of peace. What is true of the nation is true of the individuals constituting the nation. The gun-stock is now to be turned into the ornamental bracket to support the statuette of Peace; the block of wood which was to have been converted into an instrument of destruction, is now to take some form of beauty; and, instead of becoming a weapon of offence or defence, ministering to the evil genius of sorrow and of death, it is destined to increase human happiness by multiplying those small adornments of our hearths and homes, which add to the enjoyments of life. The Wood-Carving Company are now resolved to show the public what their machines can do in the way of ornamentation, and to convince them that with such a fair share of patronage as may require the reproduction of many copies of the same artistic work, that a much higher form of Art-decoration, than we have been accustomed to, may be brought within the limits of nearly all classes of society.

It may appear to many of our readers, that it is not easy to produce a machine which shall possess the power of removing the surface of a slab of wood in such a manner as to leave

traced upon it some artistic design. It may be understood that, upon a plane surface, a cutting tool, driven by machinery, may be directed to cut an arabesque tracery, but that a figure in the highest relief could be thus formed, it may not be so easy to conceive; yet nothing is more easy than the manner in which this is effected: and the machine produces, without difficulty, the beautiful foliage and fruit of a Gibbons, or the bas-reliefs of a Flaxman.

We will endeavour to explain the principles upon which this adaptation of mechanics depends, and to describe the machines now in use at the works. If any of our readers will take a flat bar of wood, about a yard long, and attach to one end a pencil, and to the other a blunt pointer, he will be furnished with a simple piece of apparatus which will explain the whole affair. If he takes a medallion, and passes the pointer across its face, in parallel lines, following this parallelism irrespectively of the elevations or depressions, and, at the same time, allow the pencil at the other end to mark lines upon a sheet of paper, which by an assistant is kept steadily pressed against it, it will be found that by the inequalities and curvatures of the lines we thus obtain a rough copy of the medallion. Upon this principle, modified for convenience in its forms of application, several engraving-machines have been constructed.

Supposing, instead of the pencil, we place a cutter at the end of the bar, and give to it a rotatory motion, keeping it pressed upon a cake of plaster of Paris, or any yielding material, it will be evident that, if when the tracer is on the point of greatest elevation, it then corresponds with the surface of the plaster—that as the pointer descends, the cutter will penetrate in the same degree, and thus produce, eventually, a copy of the medallion. The rough experiment thus described will not give

such results as would be satisfactory,—they will necessarily be exceedingly rough and imperfect; but, incomplete as the whole arrangement may be, it faithfully represents the principle involved in the wood-carving machine. The nice mechanical appliances, upon which depend the perfection of the work executed, must now be more accurately described.

The wood-carving machine consists of two parts, each having its own peculiar movement quite independent of the other, but each capable of acting simultaneously, and in unison with the other. The first or horizontal part is the bed-plate and floating table, on which the blocks of wood to receive the carving and the copy are to be placed. This floating table will be presently better understood; but it may be as well to explain as we proceed the general principle of each part. Now if we place two perfectly smooth pieces of wood one upon the other, and while we move the under one to and from us, we give a motion from left to right, or the contrary, to the upper one, it will be evident that by these combined motions we can describe almost any curve; such is the floating table of the wood-carving machine. The second, or vertical part of the machine, is that which carries the tracing and cutting tools, the only motion of which, except the revolution of the cutters, is vertical.

We have now the horizontal table, capable of moving about in every possible direction in its own plane, and we have a point over that table capable of moving in a vertical line only. If the point remains fixed and in contact with the table while moving over various curves and right lines, lines corresponding with these movements will be described on the table in the same manner as they would have been had the table been fixed and the point moved; but if while these horizontal movements are going on, we add the vertical movement of the point,

we then trace a solid figure which has for its plane, the outline described by the horizontal motion of the table, and for its elevation, the outline described by the vertical motion of the point. The pointer in our former illustration we will suppose now to have a vertical movement only, while the medallion, or any simple solid form, is moving horizontally under it in the required directions by means of the floating table.

The accompanying wood-cut represents a section of the wood-carving machine. A B is a cast-iron frame forming the bed of the machine,

the upper portion of the sides A B are planed perfectly straight, smooth, and parallel, and they serve as a railway for the wheels C C to run on. These wheels are mounted between centres, which are fixed to a frame, and are so adjusted as to ensure the steady motion of it in an horizontal plane, and in the direction of the lower rails only; above these is the floating table D, or chuck of the machine, to which the work and the patterns are attached, and it is furnished with wheels, which roll on the upper edges of the frame, the like precaution of nice adjustment being observed. It will readily be seen

that this arrangement gives the workman the power of moving the work above in every possible direction in an horizontal plane. 2 2 are the supports for the vertical slide, and the other parts connected with the cutting and tracing apparatus. Motion is given to the mandrils by the band 12, which is driven by a steam-engine at such a rate as to produce from 5000 to 7000 revolutions of the cutter per minute. The treddle, which is seen below the table, is managed by the workman's foot, and by it he is enabled to raise and depress the cutters, it being connected with the horizontal bar carrying the pulleys. Weights act as a counterpoise to the slide, and the parts connected with it, which can be varied at pleasure, according to the number of mandrils in use. 15 is a top screw, which regulates the range of the slide to which it is fixed, so that it cannot turn in its bearings; it passes through a free hole in the bracket, which serves as a stop to the locking-nuts, as at 17, and those may be fixed on any part of the screw, so as to determine the distance through which the slide shall move. In very large machines, it is requisite to introduce some mechanical arrangement for giving the workman more command over the movements of the floating table, and the plan shown in the drawing at E has been found effective. This arrangement consists of the steering wheel and its axle, which passes across the centre of the lower rolling frame, and is furnished with a drum of three or four inches diameter, about which is coiled the centre of a wire line, while its ends are fixed to screws, which pass through sockets east on the floating table, consequently, on turning the steering wheel to the right or left, will give a corresponding motion to the work. Just inside the steering wheel, and on the same axis, there is a small cogged wheel, which serves to fix the axle, and consequently to stop the motion from right to left whenever the detent is dropped into its cogs. Of course there are many arrangements of the pinion and screw which might be used to produce the same effect.

In the following wood-cut is shown more distinctly the tracer and cutters: *p* is the tracer,

and *m m* the entters; *f g* represents the object to be copied, and *j k* the wood upon which the carving is to be made. It will be evident upon examining this drawing that since both the entters and the tracer are fixed upon an unyielding bar, that they obey exactly the same vertical motion; as the tracer is raised or depressed in passing over the model, so are the entters lifted from, or sunk into, the wood. By the very rapid motion which is given to the entters, the wood is speedily removed, and in a very short time a rough copy of any, even an elaborate, work is made.

The patentee has described the advantages and purposes of his machine; in part, we borrow his words. He believes that machinery will do for the sculptor and carver what engraving has done for the painter; and he also believes that it will do it without throwing out of employ any class of artists or artisans, however talented or however humble,—for machinery cannot do the work of the mind, although it can assist very materially its creations. Neither can machinery produce that smoothness of surface and delicacy

of finish requisite in good works; or perhaps it would be safer to say that it is not desirable to attempt it. The whole object of the machine is to produce the work quickly and cheaply; and in approaching towards the finish of a piece of carving, there is a point at which machine becomes more expensive than hand-labour. It is, therefore, a matter of commercial calculation as to how far it is desirable to finish on the machine, and when to deliver the work into the hands of the workman. The machine, as it is at present employed, executes about two-thirds of the work—the nice manipulation required for the production of choice carvings being committed to well-qualified wood-carvers.

One of the best features, remarks the patentee, so far as the progress of Art is concerned, is that it still leaves the artist full power over the material he employs, and enables him to give to the world repetitions of his best works, with his own ideas and his own touches embodied on their surface. A clay model, or a cast from one, can be placed on the machine, and by careful manipulation, in a few hours, three or four copies of the work can be produced; and then, a few hours more of his talented labour will make the production of the machine equal to the original design. Any solid form which the hand of the artist can execute, can be reproduced by these machines. An examination of the productions in the show-rooms of the Wood-Carving Works in the Belvedere Road, will carry conviction to all of the truth of our statement. It may appear no easy matter to send a cutter round corners, and even to remove the substance from below, without disturbing the surface, as in the case of a bird's wings, or of foliage; this is, however, effected with great facility by means of bent entters. In the first wood-cut to this article are represented a series of entters of the different shapes employed: it will be quite evident upon inspection, that No. 6 would undercut wood in the easiest possible manner, and that by varying the shape and kind of cutter, that undercutting to any extent may be carried out. We have executed by this machine—that which has long been done, but which still remains quite a puzzle to many persons—the cutting of ivory balls one within the other, now done by the ingenious turner—though formerly these ornaments were solely of Chinese manufacture.

We have seen some of the most beautiful works of Grinling Gibbons reproduced by the carving machinery, and we cannot but fancy, if those delicate productions were rendered more familiar than they are to the public, that for internal ornamentation, copies of them, such as this machine could furnish, would be much used. The fine doves, palm-branches, and pelicans of the chapel at Windsor, or the decorations of the side aisles of St. Paul's, would bear repeating, and might be applied with much advantage, where meaner ornaments are now employed. The foliage, flowers, and feathers of Chatsworth, with their delicacy and their truth, might form fitting ornaments for many a drawing-room; and all these the carving-machine has the power of reproducing. We know not if the flying entters and the floating table could reproduce the celebrated point-lace collar of Mr. Gibbons, but we have seen the most delicate of leaves and tendrils, cut by the efforts of the steam-engine impelling these exact tools.

To produce cheaply works similar to some of these would be an important achievement; and we have seen this machine do so much, that we are certain it is capable of doing much more.

The whole of the carved works in wood of the Houses of Parliament have been executed by these carving-machines. Every form of architectural ornament can be produced by the machine, requiring but very little hand-labour

to finish it. We have seen examples of the Ionic anthemion, and of the Doric fret, nearly finished on the machine: volutes, and indeed all the geometrical traceries employed by the architect, are readily produced. Every form of Gothic ornament, such as are now so common in our more recently built churches, can be cut with great rapidity and precision. With the revival of a taste in decorative architecture for the ornaments of the mediæval periods, we may expect to see full employment given to these machines, for the production of the multitude of similar ornaments which will be required for the churches now in course of erection.

The operations of these machines do not limit them to wood—they are capable of executing work upon the Bath, Oolite, and the Portland, or on the Caen stone; indeed, upon any stone which is not harder than statuary marble. A series of the ornaments in front of the Treasury, at Whitehall, were produced by these machines. Corinthian capitals, and highly ornamented friezes, have been carved at these works.

Left-hand copies can be made from right-hand models, and thus are all the conditions met which are demanded, where repetitions of the same object are required, and where certain conditions must be met. Within certain limits too the machine can produce reductions from the original works; and by a very simple adaptation of the principle of the pantograph, this power of reduction might be carried out to any extent.

Having endeavoured to describe these very interesting machines,—which are now largely employed in the manufacture of gun-stocks, and by which can be produced, with almost equal ease, the barber's block, the shoe-maker's last, and the finished work of the artist's hand,—it only remains for us to remind our readers, that we have, after a lapse of eight years, again called attention to it, because we have believed it capable of fulfilling one of the objects which the *Art-Journal* has ever kept in view.

We desire to see chaste and elegant forms take the place of the unmeaning ornaments to which the public have become accustomed; instead of the unsightly things which now meet the eye at every turn, in all our dwellings—which are only endured because we have grown familiar with deformity—we wish to find beautiful forms, such as Nature gives us, continually making their mute appeals to us. This is only to be effected by cheapening the productions of the works of our best artists, and we see no other way of cheapening them than the reproduction of them by machinery. Our Schools of Design are spreading over the land, and we hope they are diffusing a taste superior to that which recently existed; the elegant designs which we have seen produced by the students in those schools remain unexecuted in any material, and are therefore valueless. With the powers which these machines possess, why might not the student of the school of design learn to mould his thoughts in clay, and then the object could readily be reproduced in wood, or in the softer varieties of stone?

We learn that the Wood-Carving Company are now making new arrangements for carrying out fully the Art principle, and with this object in view, they have appointed Mr. Rogers, the well-known wood-carver, as the Art-director of the establishment. We need not say a word in commendation of this appointment. For the sake of themselves and for the public, we especially desire to see the experiment of Art-reproduction fully and fairly tried, and we are confident the experiment could not be committed to better hands.

R. HUNT.

THE NATIONAL GALLERY.

THE unaccountable success, in the House of Commons, of Lord Elcho's recent motion, by which he aspired to defeat the bill for at length determining the future site of the National Gallery, has once more postponed indefinitely what, after a host of difficulties overcome, had for some time past been considered ripe for action, and was understood to have given way only to the reasonable obstruction of higher objects and more imperious events. What serious ends are to be served by this new delay in a matter which, not only is important in itself, but has other important interests necessarily awaiting its solution, we feel it far from easy to understand; but certain immediate consequences are clear enough, to which it would be difficult to assign any value beyond that of their being illustrations of the national character. In the first place, the people are thus made, by the mouth-piece of their representatives, to practise, as is not very unusual with them, a piece of self-stultification; having, when last they had time to attend to this matter, voted a sum of upwards of £170,000 out of their own pockets with a direct view to the plan now for the time defeated. In the second place, John Bull is by this vote once more handed over to an exercise with which he is sufficiently familiar,—but which does not present him in the most sagacious aspect before his neighbours, while it stands between himself and many a useful, practical result. The exercise in question is, that of inquiring into previous inquiries—sitting in commission on laborious and completed commissions—investigating accomplished investigations—making, in fact, as the most extreme advocates of this practice do, the thorough sifting of a subject the reason for sifting it over again. We suppose, the wisdom involved in this process would be defended as belonging to the kind which suggests the repeated testing of a sum in arithmetic, for security's sake; but we can only say that, after all the education which it has had, we think the nation should, by this time, be more confident in the use of its figures,—and that the public business is seriously impeded by its want of faith in its own working out of a problem. To us, this practice of re-integrating resolved doubts seems rather to resemble the idle pastime of replacing the nine-pins that have been bowled down, for the express pleasure of bowling them down over again. The third consequence which the nation derives from this remarkable vote, is, that of remaining, certainly for another year, in that wondrous state of inefficiency and confusion which had already led to all these finished inquiries (while we are inquiring if these had been properly inquired about),—and so riding in a circle; a species of exereitation dear to the heart of John Bull, but inconvenient as leading him nowhere. It is wonderful, the love we have in this country for lavish establishments that serve no purpose for want of organisation—costly collections brought from long distances, and stowed away in cellars—valuables sorted, and then put elaborately out of their places—keepers with nothing to keep, and things to be kept with no qualified keepers—officers without an office, and offices where no one can find out who is the proper officer—directors having no direction—trustees without a trust—institutions where, in the matter of responsibility, everybody is behind somebody else—and museums in which, for the purposes of teaching, every thing is in every other thing's way. In like manner, we have been fond, till of late, of setting up a costly organisation of one kind or another, and when it was complete and well endowed, setting up and paying another to do its work. Things are greatly mended now-a-days,—and they will cer-

tainly mend much more if we can only get rid of unmeaning obstructives like this motion of Lord Elcho's; but it is not very many years since the principal operation of the wealthy old societies was that of propagating others. The Royal Society had a numerous offspring in its dignified retirement; the Zoological was born of the indolent old age of the Linnæan; and the Archaeologicals were established to perform the unexecuted commission of the antiquaries. One advantage obtained by this separation of a whole into its parts, was, that the strength which resides in their union was liberally sacrificed,—to be recovered somewhere else, and at some further cost, if it could; and this peculiarly English form of economy was enhanced to the utmost by such a careful separation from one another of all the Arts and Sciences as *wholes* (as well as of the parts which made up each whole), as dispensed with the benefits that they mutually confer by their natural connexion, and by the incidental illustrations that they offer to one another. A noticeable form of the gain in this case of separate action has been that certain portions of the machinery which would have been common to all in their union, had to be repeated for each in their disjunction, with the double advantage of increased expense and diminished efficiency:—and it will readily be seen, that this practice of constituting one association to do the work of an association previously constituted, and this augmentation of cost by duplication of machinery, resulted both from the same quality in the national mind which prompts it now to the appointment of a live committee to go again over the ground of a committee defunct. In a word, whether from indolence, or from over timidity, John Bull is easily persuaded to be content with the provisional:—and so, the provisional is to continue in this matter of the National Gallery, because it has pleased Lord Elcho to demand an inquiry into topics that have all been thoroughly inquired into already, and to object to a measure which is the direct logical sequence of a series of measures all previously affirmed by the same assembly that has now granted his demand.

However, Lord Elcho has got his commission,—and his commission will proceed to inquire; and, though we have ourselves no doubt whatever as to what the result of that, and of every other inquiry (in case there should be yet a few more) will be, it may be as well, just for the exercise's sake, to examine, with our readers, the beaten ground over which the commission has to travel.

The subject matter of the proposition which is to furnish the text of a new Blue-book—or, more properly speaking, of a new and revised edition of the old ones—divides itself into two heads:—Can the National Gallery remain where it is? If not, whither is it to go? The negative which the first of these questions has received is made to rest on two several grounds, either of which singly is more than sufficient to sustain it, and which form together a position impregnable to any twenty commissions. One of these grounds is, that a treasure whose value is essential and not submissive to any common standards, whose properties are subtle and transcendental, and which, by the conditions of the case, is irreplaceable, is visibly deteriorating where it is, owing to certain atmospheric and other influences which are active in the locality. On this head of objection to the present site, it is true that there are diversities of opinion; and they who admit the objection meet it by the statement of certain disadvantages of another kind which, in their opinion, will attend a removal. Now, reserving to ourselves the right to question these alleged disadvantages—we say, that were they real, and tenfold what they are, they must of necessity be subordinate to that which, if also real, affects the very existence of

the pictures. The integrity of a treasure is a condition necessarily precedent to any and every question of its uses. Admitting, then, the differences of expressed opinion as regards this question of local injury, we have to say, that if the weight of authority on the two sides were equal, we would still give the collection the benefit of our fears, and, just for security's sake, set the warnings of the one side above the confidence of the other. In that case we would make the latter's—

“ Assurance doubly sure,
And take a bond of fate.”

But, both as regards the number and the quality of the witnesses, there is, in fact, such a preponderance of evidence against the present site, on the ground stated, as must of itself affirm the question of removal in every field of inquiry except the field of polemics.

The other ground on which the proposition for the removal from its present site of the National Gallery rests, is, as we have said, one which would amply sustain that proposition by itself, even if it had not the corroboration of the life-and-death argument to which we have alluded. The second argument is, that, while the present building is insufficient for the mere reception of the treasures which we possess, the nation is constantly losing new treasures for want of space to put them in; and that, by no possible expansion which the capabilities of the existing site will admit, can room be obtained for such an arrangement and classification of our Art-possession, and their probable additions, as can raise a collection to the dignity which should be implied in the title of a National Gallery. It was well observed in the House of Commons, in the debate on this important subject, that before we had even our present narrow accommodations, the nation had lost several magnificent collections because its fortunes had not yet enabled it (or such was its opinion) to keep house for the Fine Arts. The Dulwich and Fitzwilliam Collections were mentioned as instances:—but our readers know well that there were others. Since we have set up as housekeepers in Trafalgar Square, the Blue-books report of a variety of intended gifts which have been diverted, or suspended, because the munificent donors disapproved of the narrow scale of the national establishment. Of two collections which *have* reached the nation, in spite of its penuriousness, it is not very long since one, the Veruon, was taken out of the coal-hole (where it had had to be stowed away), and put out to board; while the other—the Turner pictures—will have, when it shall please objectors like Lord Elcho to let us at length provide due accommodations, to be disinterred from some unknown recess:—none the better, in all probability, for the twelve months' further exhumation to which the noble lord has succeeded in consigning them. What the country is proved to have lost for want of suitable accommodations, may be taken as the probable measure of what it will gain when such accommodations shall have been provided. But besides more space as measured by numbers, it is now at length well understood amongst us that a National Gallery, to embody its true ideal, must be something more than a mere collection of examples, however illustrious; and that in the building which contains it we should have all the space necessary for such a disposition of those examples as may compose them into a complete history—genealogical, chronological, and geographical—of the art which individually they illustrate. This, as regards the national pictures alone:—which should be so complete, and so classed, as to exhibit the whole development of the art of painting. But, largely understood, the matter does not end here. Properly speaking, a National Gallery cannot illustrate one province only in the domain of Art: painting, sculpture, architecture, anti-

quities, engraving, and even the lower arts of decoration, all subsidise and throw light on one another, and belong to the same history. The business of classification once begun, it will be seen that it can be carried out in its completeness only by an assemblage, either in one establishment or in adjacent ones, of objects illustrating the entire range of the Arts of Design. There is yet a larger view of the subject, which sees the relations that all the Arts and Sciences have to one another, and the interdependence of each on all and all on each,—and would gladly have them all gradually assembled in a single neighbourhood, for the purposes of illustration and of reference. The question of removal, therefore, we fancy, the new commission will find pretty well settled to their hands; and their differences of opinion, should they have any, will, in all probability, be limited to the other question of the future locality.

There are two methods in which an argument for the future location of the National Gallery on the Gore Estate may be conducted. One is, by asking *where*, if it be not to go thither, *shall* the Gallery go? We have little doubt that, if due regard be given to the demands of the ease in conformity with the views which we have already laid down, the process of exhaustion by this method will inevitably land the commission on the site to which the bill defeated by Lord Elcho's motion would have taken us if he would have let it. Sites which permit the realisation of our present plans in such a manner as shall leave them expansive to any proportions which the future is likely to suggest, will not be found so abundant that we can afford to overlook this important quality of the one which here is ready to our hand. The very terms of Lord Elcho's own motion, which proposes that the new commission shall report "on the desirableness of combining with it [the new National Gallery] the Fine Art and Archaeological Collections of the British Museum, in accordance with the recommendation of the Select Committee on the National Gallery in 1853,"—a measure in the exact direction which we have been recommending, and which, besides, would relieve one institution to illustrate another,—might themselves induce him to turn a loving eye on the broad acres of the Kensington Estate.—It seems to us, however, that a readier method than the one suggested of arriving at the same result will be, that of inquiring, in the first instance, why the Gallery should *not* go to the Kensington property? Because, if all the arguments designate this as in every way a most fitting locality, there can be no good reason why we should mount behind Lord Elcho on his hobby for a site-hunt in clondland, or discuss with him the inconvenience for our practical purposes of a Fine Art *Chateau en Espagne*.

Now, not only do we find a multitude of reasons, besides its large acreage, which point directly to the site of the Gore Estate, but we know of no reason good against it in any sense which is not good against every other. The argument against it on the score of distance—which, however, we intend to dispute—must, by those who employ it at all, be equally employed against the ground on which Kensington Palace stands, and against all other sites that abandon the London streets; while, all sites suggested in the streets themselves have this strange radical defect, that if there be no objection to them on the score of their exposure to the smoke and dust and idlers of the metropolis, then there is no reason for the removal at all of the Gallery from its present site on the plea which is most freely admitted. Pausing for a moment, to allow to the supporters of Lord Elcho's motion that the site of Kensington Palace would certainly be a magnificent location, if it had not already another appropriation which renders its introduction into the discussion simply idle,—we may, at the same time,

observe, that, with the exception of its somewhat readier command of the more northern line of metropolitan thoroughfare, we know of none other of the adaptabilities to the purposes of an institution like the one in question which is not shared with it by the Gore Estate. The two locations form one neighbourhood, and have identical incidents. It has been said, for instance, by those who supported Lord Elcho in his measure of obstruction, that if a removal of the pictures, for their health's sake, from the metropolitan malaria be a necessity, the removal to the Gore Estate is not far enough,—and that the collection would be there only settled down in a spot to which the causes that occasioned its abandonment of Trafalgar Square will ere long follow it. Now—not pausing to take exception to the spirit of those objectors who think Kensington both too far away and not far enough,—and who, again, on the question of distance, consider Kensington Palace well placed, but have both sides of the argument to bring against the estate of the Royal Commissioners at Kensington,—who, in fact, for the sake of objecting at all, accumulate all sorts of intercontradictory objections, like the counts of a legal indictment which neutralise each other to the sense of simple logic,—we will reply, that, as regards the matter charged, the Kensington Estate shares all the immunities of the Kensington Park, and that the conditions of its site preclude all chance of its ever being surrounded in the same unwholesome sense, or subjected to the same prejudicial influences, as in Trafalgar Square. "From no probable circumstance," well remarked Mr. Disraeli, in the debate on this question, "can it be inconveniently close to any surrounding buildings. It will always have a space of seven hundred acres—the area of Kensington Gardens and Hyde Park—in its front; and it will always have in its own garden a considerable area free behind it. The houses which will rise in its vicinity will probably be houses of that high class that will never exercise upon this building that injurious influence which has been so generally acknowledged and expatiated upon."—We remember, that certain gentlemen riding hobbies in search of a site for the new National Gallery, came upon Hyde Park; and, as the elevation at which the hobby is usually ridden is apt to suggest abstract views, they forthwith mapped out a location or two as speculative Fine Art conquests, and gave provisional notice to the Dryads. Now, while we are in the way of admissions, we are, again, free to admit, that a sufficient slice out of one of the parks would furnish admirable ground for a Palace of the Fine Arts. But, as we agree with Mr. Disraeli in thinking, that "the question as to where our National Gallery is to be placed, and the building of a National Gallery, are of *very pressing necessity*," we are irresistibly attracted to the region of facts; and we cannot but remember, also, how vehemently the people resist all attempts at invasion of these their breathing spaces, even for a temporary purpose, and how eagerly they defend every inch of the green sward, as if it were fairyland. For practical purposes, then, we may as well return to a simple enumeration of the many advantages offered by the site of the Kensington Gore Estate.

In the first place, this estate—which consists of eighty-six acres, has cost £342,000, is worth more now than its original cost, and is necessarily increasing in value—is, as we have said, expansive to the extent of any conceivable demands which the future may bring for the purposes of either perfecting or supplementing the Gallery which we are all desirous of seeing raised to the dignity of a national illustration.—Then, we have the authority of Mr. Tite for saying, that the ground has frontage for "a building 700 or 800 feet long, and displaying much architectural beauty."—It is out of the smoke

of London; yet at easy walking distance, as the thousands who poured through the first Crystal Palace can testify, and of most commodious access, having all the great west-end parks as its distant avenues.—It has a dry gravelly soil, so notoriously, that the soil has given its name to the neighbourhood; and a consequent climate which has long recommended its quarter as the residence of the consumptive Londoner, and may recommend it now as a very fit home for consumptive pictures.—And when all these advantages of natural position are told, there remain to this site two crowning recommendations of another kind, which the advocates of other localities have no chance of matching, and which should surely settle the question. One half of it is a *free gift* to the nation; while the other half is already the *nation's own*, and paid for, as we have said, with its own money. The logic involved in these last two arguments is as authoritative as the economy. Out of the Great Exhibition, held in this very neighbourhood, which exhibited to us our national inferiority in the Arts of Design, issued the funds that will help to provide us here with the ample site of a great institution for the teaching of the Arts of Design to the nation:—while, the people's own large contribution to the purchase of that site demands, as we have already hinted, that they shall now be logically true to the purpose which suggested it,—and renders the delay interposed by Lord Elcho's motion at once an inconsistency and a calamity.

We have, in an earlier part of this article, reserved to ourselves the right to contend, that the argument which is derived from the alleged advantages of a central metropolitan position against *any* removal of the Gallery—and which argument, on the first statement, is not without an apparent plausibility—has little force when it comes to be examined. There is, in fact, scarcely any class of the community to whom a distance such as is involved in the removal to the Gore Estate is a disadvantage. To the easy and luxurious classes, of course, the distance is nothing,—and the objection has never been offered for their sakes. But, it is a great mistake to suppose—as has been apprehended and urged by the objectors—that the working population of London make that habitual use of the Gallery, in the short daily intervals at their disposal, which has been deemed a leading argument for keeping it in the streets. They who have seen how, on such occasions, the people pour through the Galleries at Greenwich and at Hampton Court, know that distance, instead of being an obstacle, is in itself an inducement;—surrounding their air of popular *dilettantism* with the pleasures of an excursion, and dignifying their love of excursion with a *dilettanti* air. To them, Art has a more intelligible voice when its appeal is made amid the flow of waters, and the song of birds, and the scent of flowers. To all such influences may they be ever, and by all means, kept actively alive!—and, for *their* sakes, we could be prepared to argue a removal of our National Gallery into the country on its own ground. It is wise statemanship which adds a new inducement to the people, in their unoccupied moments, to wander away from the stifling streets,—and introduces into the rare banquet by which nature refreshes their weary spirit some of the food by which Art may nourish their awakened minds.—If there be any class on whose behalf, for certain reasons, this removal of the Gallery might, perhaps, be deprecated, it is that of the Art-student; to whom it might be more convenient to have his schools nearer. But, out of the completeness to be obtained by the removal, *he*, in the end, will gain incalculably more than he loses by the removal itself:—to say nothing of the fact, that the disintegration of the pictures, where they are, would be the eventual loss of his school altogether.

THE DUTCH GENRE-PAINTERS.

BY F. W. FAIRHOLT, F.S.A. *

WITH ILLUSTRATIONS FROM ORIGINAL SKETCHES
BY THE AUTHOR.

STOLID and unchanging as Dutchmen appear to be, two centuries have not passed over their country without producing very considerable changes in it. While the tourist will note, as we have already done, much that reminds him of his first impressions of Dutch life obtained from Dutch pictures, there is also much that has passed away from the land for ever, and which only exists in such representations. You still observe the ivy-grown farmhouse, with its "thick-pleached orchard," and its quaint walls and gates; but you see no longer the loosely dressed boor, with his wide Spanish doublet and balloon-breeches—Paris has invaded Holland, and the *Magasin des Modes* has had power enough to transform a Dutchman into a comparatively fashionable being. Village life now is not the village life of Ostade and Gerard Dow—it is less picturesque and less slatternly; it displays more of Dutch formality than we see in their works, but it has more of comfort and respectability. It is in the quiet village inns that are still scattered over the land we may now detect the last relics of old manners. As you approach the principal towns you see many of these welcome hostelrys, the doors bowered over with grape vines, and looking worthy the pencil of an Ostade, while the long shed beside their trim gardens may, mentally, be easily peopled by the skittle and tric-trac players of Teniers. In the open space before the house a tall pole, some thirty feet in height, is frequently to be observed; it is crowned on gala days with a sort of weatherecock, and the wooden bars, placed at some distance around it, are the marks where the men stand to shoot at it. It is the old *papeguay*, or fictitious parrot, which exercised the ability of the young villagers at a time when archery was generally enforced as a practice. In our country the custom was also adopted, and shooting at the popinjay was as usual in an English village of the time of Elizabeth as it was among the Dutch, who still preserve their village life more unchanged than we do. Popular customs are at all times the last to succumb to fashion; and while large towns vary continually, and take the most recent tone of manners, the village goes on in the present generation pretty much as it did in the last. Novelties are not so welcome there, and are looked upon generally with a characteristic distrust.

But while we speak of changes in Holland since the days of the old painters who have made its past age famous, it must be borne in mind that they are the slow results of nearly two centuries, and after all by no means make so great a change during that long period as has been effected elsewhere. Even in the towns many old customs are retained that have been in use time-out-of-mind, and which have been immortalised in some picture of one or other of the old masters of Holland. We have already noted the humorous works of Jan Steen as the truest transcripts of the manners which he saw around him. One of them depicts a fellow dancing joyously into a room with a fresh herring in his hand, exultingly upheld by the tail. His antics are received with a broad smile from all present. It would be difficult for an ordinary spectator to understand all this, did he not know that a fresh herring is considered by the Dutch a panacea for every complaint; and their arrival on their shores is hailed with so much joy, that the first who hears the news generally makes it publicly known by hanging at his door a frame, decorated with evergreen flowers and coloured paper, in honour of the joyful event. This silent mode of communicating intelligence is used on other occasions. Thus, at Haarlem, it is a custom on the birth of a child to affix to the principal door, to denote the event, a pincushion, which is constructed of red silk, covered with lace, and deeply fringed. The sex of the child is defined by a small piece of white paper placed between the lace and cushion if it is a girl, but the absence of all mark denotes a boy. This custom has other and solid advantages; it not only prevents intrusive curiosity, but for a certain period the house is protected from actions for debt—no

bailiffs dare molest it, no soldiers can be billeted on it, and when troops march past the drums invariably cease to beat.*

One Dutch town is so much like another that but for a few remnants of an ancient kind they would become monotonous to the stranger. Some of these relics are extremely picturesque; and at Haarlem the old Butchery is so costly and beautiful a building, with its varied walls of white stone and red brick, and its richly-carved decorations, as to make it one of the principal features of the town. We must, however, go back to old engravings if we

THE HERRING SIGN.

would see the very streets in which the men of the days of Dow and Mieris walked. Fortunately, their features have been preserved in old engravings scattered through books sometimes devoted to subjects of another kind. Our view of the stadtholder's house at Haarlem, and the surrounding buildings, is of this nature; and is copied from La Serre's very curious volume descriptive of the reception given to the queen-mother, Queen Catherine de Medicis, by the principal Dutch towns, in the year 1635, when she paid a visit to the Low Countries on

her way to her daughter Henrietta Maria, the queen of our unfortunate Charles I., performing the journey from Bar-le-Duc to Goreum, and crossing the sea from thence to Harwich.

Some of the Dutch towns are less altered in their general features than might have been imagined, and this is strikingly the case with the chief of them, Amsterdam. The peculiar nature of its foundations, and the difficulty of tampering with its necessary arrangements, may have induced this. The visitor at the present time who may row across the arm of the Zuyder Zee to the shores of the boggy district oppo-

THE BIRTH-TOKEN.

site, known as "Waterland," will see a city in no degree changed in its broad aspect from the days of Rembrandt. When Catherine de Medicis made her "happy entry" into that city, in 1635, its features from this point were delineated by De Vlieger, and have been copied in our cut. It might have been sketched yesterday, so completely does it give the striking characteristics of this old city of the sea.

The Hague, as it appeared during the palmy era of Dutch Art, is seen in another of our cuts, and that being the "fashionable" locality has changed

THE STADTHOLDER'S HOUSE, HAARLEM, 1635.

most: indeed, there has been a visible desire to make it accord to the refinements and tastes of modern high life, as much as can be consistent with national character. It is the residence of the count, and is to Amsterdam what the Versailles of the days of Louis XIV. was to Paris. There is one characteristic feature of the Hague which has remained unchanged,—and that is the favourite promenade on

the road to Scheveningen, or Scheveling, as it is sometimes called. It is an avenue of oaks and limes, nearly three miles in length, perfectly straight, and bounded by the little steeple of the parish church of Scheveningen at the further end, which may be seen from the Hague. The trees are here allowed to grow in full luxuriance, and shadow the road, which is never lonely—for the Hague is the most pleasant and healthy of Dutch towns, and the favourite resort of the Hollander. The refreshing sea-breeze may always be inhaled here—hence pedestrians and equestrians choose this road, and the idle find constant

* The custom is traditionally reported to have originated owing to the death of a merchant's wife, whose house had been entered noisily and rudely by officers, on the occasion of his bankruptcy, during her confinement.

* Continued from page 211.

amusement in sitting under the trees, and watching the passers-by. Scheveningen is a little fishing village on the sea-shore, occupied by about three hundred fishermen, and their earts may be met on this road in the morning, drawn by strong dogs, conveying fish to the Hague. The situation of the village itself is particularly dreary; the sea-margin is a sandy desert, planted here and there with rushes to prevent the sand from blowing over-land in stormy weather. It is of interest in English history as the place from whence King Charles II. embarked to resume the sovereignty of England.* It might have been better for England if its historians had no such record to write. It is pleasanter to remember the Hague as the birth-place of a nobler king of England—the immortal William III. But the region of politics is too stormy for our consideration—let us rather return to the happier one of Art.

The pictures of Metz, Micris, and Terburg, exhibit the highest tone of Dutch society. The wealth and comfort of their indoor life, the richness of their apparel, the simple dignity of their bearing. A Dutchman may feel proud of the ancestry delineated by his native painters, of the patriots who fought and bled more determinedly for their liberties than the men of any other nation have been called upon to do. In the really grand picture at Amsterdam, representing the city-guard met to celebrate the important treaty of Munster, which gave independence to the Dutch after long years of Spanish treachery and cruelty, the painter has truthfully portrayed men, certainly without ideal gracefulness, but with innate manly dignity which gives a lifelike charm to the picture, and has obtained for Van der Helst the highest position in this branch of Art.† To a morally-balanced mind the home-scenes of such painters are as capable of imparting pleasure as the more ambitious attempts of the heroic school, inasmuch as they generally steer clear of anachronisms and false sentiment. Art is catholic in its views, and should be received on broad principles; it would be unfair to disregard a Greek cameo because it does not overpower the eye like a bas-relief by Phidias—particularly as a study of both would assure us that the same great principles governed the mind which produced each. The minute finish which some find objectionable in such works as those of Dow and Ostade, may be excused as necessary results from minds schooled to patient labour, but they never forgot the true fundamental principles of Art; for however laboured their works appear, their design and general arrangement of colour are broad and bold. As compositions they may be viewed at any distance satisfactorily, but they will also reward the nearest scrutiny.

The painters just named were particularly happy in the delineation of what are sometimes termed "conversation pieces"—an old-fashioned designation which is singularly and usefully characteristic of such designs. In them we see a sort of daguerreotypied view of old Dutch manners. The wealth of Holland peeps forth in every one of them. The costly silks, velvets, and furs of the ladies, are rivalled by the velvets, feathers, and gold lace of their gallants. The ebony cabinets, carved chairs, and massive furniture, which generally fill the rooms delineated, display the wealth and love of comfort which reigned paramount in the dwellings of the rich merchants of the Low Countries. The very ponderosity of the various articles are characteristic; so also are the Indian jars and carpets, the parrots and monkeys, which hint very plainly the far-sighted spirit of trading enterprise that gave the Dutch nation a well-deserved pre-eminence in the seventeenth century. The traveller may yet trace in Holland the old love for the products of Eastern taste and skill, and the porcelain of China and Japan is still the ordinary ware of the Dutchman; he also revels

in a Chinese summer-house, and delights in a monkey or an aviary of birds, whose notes seem but the outpourings of a sad reminiscence of a sunny land far away, to which they will never return.

Imitative Art can never be carried farther than it was by Terburg in his famous picture known as "The Satin Gown," a picture which has been made more known by the notice it has received by Goethe in his "Wahlverwandschaften." He describes it as representing a noble, knightly-looking man, who sits with one leg over the other addressing himself to the conscience of his daughter, who stands before him. "She is a majestic figure, in a full and flowing dress

of white satin; her back only is seen, but the whole attitude shows that she is struggling with her feelings. The mother, too, seems to be concealing a little embarrassment, for she looks into a wine-glass out of which she is sipping." Whether the poet has read aright the painter's story cannot be safely declared—it is one of those pictures that want the artist's own interpretation; but the extraordinary qualities it possesses as a transcript of Nature is unrivalled, and the satin gown of the principal figure is reality itself.

There was a still lower class of imitative Art practised with unremitting patience and assiduity by

AMSTERDAM, 1635.

some few Dutch painters. They devoted themselves to "still-life," and produced representations of the humblest furniture of the kitchen. At the head of this class stands William Kalf, who was born at Amsterdam in 1630, and died in 1693, having devoted his life not only to the delineations of the gold and silver cups* of the wealthy burgomaster, but to the humblest utilities of his establishment. Yet do such simple subjects give the painter opportunities for composition, colour, and chiaro-oscuro of the finest kind. He brought great rules of Art to bear on all he delineated, and he elevated the common-

place to the poetic. "In the treatment even of these things there is an ideal, or beautiful, as distinct from a literal imitation."*

The camp-life of the Dutch was ably represented by a series of painters, who delighted to depict

"Battle's magnificently stern array."

It was, unhappily, too common a sight in Holland; the history of the country is that of one continuous struggle for freedom. The frightful scenes which Callot has depicted in his "Miseries of War" were enacted over and over again by the cruel agents of

THE HAGUE, 1635.

the Duke of Alva upon the devoted and suffering people. While they must have hated the sight of a Spanish trooper, they must have looked with joy on the native defenders of their country. Certainly, never were soldiers braver than the soldiers of Holland; never did men fight more devotedly for a

country; never were imperishable deeds of pure patriotism graven deeper on the eternal tablets of fame. We see only in the painting of the Hollander the picturesque features of war, the

"Mounting in hot haste, the steed,
The mustering squadron and the clattering car,
That pouring forward with impetuous speed
Doth swiftly form the solid ranks of war."

The prince of painters in this branch of Art is

* Leslie. "Lectures on Painting," p. 243.

* There is a very interesting and curious picture, representing this event with true Dutch minuteness, in the Gallery at Hampton Court.

† Sir Joshua Reynolds has given his opinion of this noble picture in the strongest manner; he says it is "perhaps the finest picture of portraits in the world, comprehending more of those qualities which make a perfect portrait than any other I have ever seen." Kugler also testifies to its truth, boldness, and brilliancy. It has been recently very carefully and beautifully engraved, but we lose in the engraving the admirable colouring which gives so great a charm to the noble original, making it rival in attractiveness the "Night Guard" of Rembrandt, which hangs opposite to it in the Gallery of the Hague. Two such pictures may be sought in vain elsewhere.

* The Dutch poet who composed his epitaph declares in it, that all the plate he ever painted would not be sufficient reward to so virtuous a man, as was the refined and patient painter of these metallic treasures, many of which are remarkable for their fancy and taste in design.

Philip Wouwermans. There is a picturesque beauty given by him to camp-life, which has an irresistible charm for the eye. We see the bustle which follows the trumpeters' call to horse; we notice the readiness of the well-caparisoned officer, the grudging departure of the common soldier, absorbed in gambling or drinking till the last moment has arrived to fall into the ranks. The gaiety of the uniforms, the beauty and vigour of the horses, the entire "pictorial element" which reigns over the scene, makes us feel that war thus

"Hid in magnificence, and drowned in state,
Loses the fiend."

It is a proof that the world has increased in humanity as the last two centuries have past over it; for it has been the province of modern Art alone to rob war of its false glories, and teach us to look on the reverse of the picture. Never was a poem more touchingly written than that which Sir Edwin Landseer has painted in his pictures of "Peace" and "War," which Mr. Veruon has made the property of his countrymen: never did philosopher descend more convincingly on the text that it is chiefly

"— man's inhumanity to man
Makes countless thousands mourn."

Wouwermans was the perfect type of a Dutchman—reserved, industrious, and eminently fond of home. During his whole lifetime he lived in Haarlem—unvarying the calm tenour of his course. From such a reserved man one would hardly expect these vivid pictures of peculiar phases of life. He also delighted in painting jovial parties of sportsmen—sometimes riding out with ladies, equipped for hawking, and sometimes galloping over heath and plain after the hunted stag, or reposing in the cool shade near a spring. Kugler, who notes this, also remarks, that "one of the points of interest in these pictures is the feeling for well-bred society and decorum, assisted by some little hint at a novel-like relation between the personages represented. The other main point of interest in Wouwermans' pictures is derived from the taste and knowledge with which he delighted to paint the horse, that constant companion of the out-door-life of a gentleman in all its various and manifold situations. In many of his works the horse is treated as the principal figure; he painted him in the stable; being saddled; in the *manège*; when taken to water; or to the fair. Other subjects which afford opportunity for prominently displaying the figure of the horse—such as battles, attacks by robbers, or adventures of carriers—were frequently painted by him." He had a somewhat ideal mode of treating landscape accessories, which are all subservient to the general effect of the figures introduced. Although his brother Peter was one of the most successful imitators of his peculiarities, Philip may be safely said to have originated and upheld by his own genius a peculiar phase of Art, which has never since been so successfully cultivated.

Van der Meulen, more ambitious, and less caring for the quietude of home-life, actually became a camp-follower of Louis XIV., and painted the campaigns of that monarch from observation, industriously covering the walls of Versailles with pictures of its master's heroism; and here the little *Grande Monarque* could repose amid the contemplation of his own glories, and listen to the adulations of Boileau and Racine, also bribed to be camp-followers, and narrate in fulsome strains the heroism of one who could fight in embroidered costume, attended by his favourite ladies in gilt coaches. The full-dressed glories of his battles, as depicted by his Dutch servant, seem to render war a mere showy masquerade, did we not see the devastation which proceeds far away from king and courtier in the distance, and know from the truer page of history the wanton and wicked invasions this cold-hearted voluptuary continually made upon better men than himself.

Marine-painting more naturally fell within the scope of the Hollander, and nowhere else did the art flourish so well as among the Dutch painters. Ludolf Backhuysen and William Van der Velde are names which take highest place in this department. It is recorded that Admiral de Ruyter ordered cannon to be fired from his noble vessels of war, for the express purpose of its effects being studied by the latter artist when engaged in painting his sea-fights.

It therefore is in "the actual," as exhibited in

every phase of life and nature, that the artists of Holland achieved their position; but paramount as their claims may be in this particular, we find sublimity combined with it in the works of Rembrandt, and poetry in Cuyper and Ruysdael. All is, however, strongly tinged with native feeling, so unmistakably pronounced that we could not mistake a Dutch picture for the production of the painters of any other nation. It is as visible in the landscapes of Hobbema, as it is in the peasant scenes of Ostade. But it was chiefly the popular scenes of Dutch life by the genre-painters that gave celebrity to this new school of Art, and made it generally popular.

We by no means intend in this place to combat the objections made to this style of Art by the admirers of the ideal school, or the elevated conceptions of the great masters of Italy; but simply to plead for the fact of as much ideality and poetry existing in the works of the Dutch as their sphere of action will allow. We plead for their truth; for the perfect Art-power they have in displaying this truth; for the sentiment and feeling that continually lurk beneath it, to gratify all who will diligently search for it, there as elsewhere in the world it remains—hidden from merely superficial observation. M. Charles Blane has grappled with the most difficult portion of this subject when treating of the works of Rembrandt; we will only, therefore, refer to the labours

THE ROAD TO SCHEVENINGEN.

a trait of childhood we have often observed and been amused with in Nature, for the first time so felicitously given by Art. I have noticed the natural manner in which Raphael and other great painters represented children as wholly uninterested in that which engages the attention of their elders. Here the incident is exactly the reverse, and treated with equal felicity." It may startle some few minds to find this conjunction of the names of Raphael and Maas; but no happier instance could prove the fact that

"One touch of Nature makes the whole world kin."

If we owe the artists of Holland no other gratitude for their labours, let us at least award them this their just due—all honour for the true and persevering study of Nature. The world had been in danger of losing simplicity in Art, and getting the laboured results of scholastic rules instead: an art that every one might comprehend, and be improved by the comprehension, was evolved from the ateliers of Holland. It taught that the world around us is filled with poetry to reward the ardent seeker of the beautiful, and it displayed this truth with all the vigour of an honest nature.

The lives of these artists are instructive even in their unobtrusiveness. Brief as our notices have necessarily been of their career, there is little more to record of them. They passed their lives in the closest study of Nature, and found in her varied beauties enough to employ it well in imitating her

of such artists among the other painters of the Low Countries as make ordinary life the subjects of their pencils. Leslie, in his "Lectures," has put these claims clearly: he says, "The great merit of the Flemish and Dutch painters is the absence of all affected and awkward sensibility—all that stage trickery on the spectator, by which he is made to believe himself touched at heart. This false sentiment began with Greuze, and has ever since more or less infected Art." Their power of conveying interest to the most ordinary actions he illustrates by one public example. He says, "There are few pictures in our National Gallery before which I find myself more often standing than the very small one by Maas, the subject of which is the scraping of a parsnip. A decent-looking Dutch housewife sits intently engaged in this operation, with a fine chubby child standing by her side watching the process, as children will stand and watch the most ordinary operations, with an intensity of interest as if the very existence of the whole world depended on the exact manner in which that parsnip was scraped. It is not the colour, and light and shadow, of this charming little gem, superlative as they are, that constitute its great attraction; for a mere outline of it would arrest attention among a thousand subjects of its class, and many pictures as beautiful in effect might not interest so much; but it is the delight at seeing

charms: content in the sphere of action to which their genius had assigned them, they worked on regardless of the more prosaic men around them, and patiently waited the recognition of the inherent truth of their works. Some were honoured in their own day, and reaped the harvest they had sown, but others lived poor and died neglected; yet who shall say they were not happier men than the wealthier merchants of their land? Untrammelled by the cares of trade, and freely roaming in scenes his heart responds to, the painter, however poor, is wealthy in his nobler aspirations after the beautiful, implanted in the world by the divine hand of its Maker. The mammon-worshipping professor of Art may be endowed with genius occasionally, but he is a *rara avis*, and is considerably outnumbered by his less wealthy brethren. It is, however, essential to greatness that it be allied to devotion, and that cannot be without some abandonment of self. The world, it has been said, frequently knows nothing of its greatest men; but are not such men made great by abstraction from its narrowing jealousies, its struggles for power, its sacrifice of simplicity and pure-mindedness at the shrine of wealth and worldliness?

In the course of these notices of the artists of Holland, we have hitherto left unrecorded a most important section—the Landscape-Painters. In a concluding paper we shall detail their claims to consideration as the successful originators of this as a distinct art.

THE ROYAL PICTURES.

THE STAR IN THE EAST.

H. Warren, Painter. R. Brandard, Engraver.
Size of the Picture, 2 ft. 4½ in. by 9¾ in.

No artist whose mind was not thoroughly imbued with true poetical feeling would have attempted such a subject as this; or it might, perhaps, rather be said that only a painter so gifted could have made it what it is—a scene so picturesque in its simplicity and so impressive in its solemn quietude as to invoke a feeling of religious awe. In the hands of an ordinary artist a few camels travelling along the arid desert would have proved a very commonplace theme: Mr. Warren has found the materials ample for a most attractive picture.

St. Matthew alone of the four evangelists relates the history which has supplied the subject:—

“Then Herod, when he had privily called the wise men, enquired of them diligently what time the star appeared.

“And he sent them to Bethlehem, and said, Go and search diligently for the young child; and when ye have found him, bring me word again, that I may come and worship him also.

“When they had heard the king, they departed; and, lo, the star, which they saw in the east, went before them.”

Biblical students have been at some pains to ascertain whence these wise men, or Magi, as they are generally called, came. The term Magi was commonly used among Eastern nations to denote philosophers, and those who devoted themselves to the study of the moral and physical sciences, especially astrology and medicine. The wise men who went to Jerusalem to seek the infant Christ were doubtless philosophers of this description. As they were constantly studying the face of the heavens, the star or luminous body which appeared on this occasion could not have escaped their notice; and as it was a current notion that any extraordinary appearance in the heavens denoted some remarkable event, they were in a great measure prepared for what was about to happen, especially as a report prevailed throughout the civilised world, that at this time a king was to arise, and rule over the country of Judea. Most commentators are of opinion that the wise men alluded to by the evangelist were inhabitants of Persia or Mesopotamia—countries in which astrology was, perhaps, more closely studied than in any other to the east of Jerusalem. Presuming this to be fact, it opens up another interesting question—namely, the religion which these Magi professed; for it is scarcely to be supposed that such a communication would be addressed to idolators, though it would probably be made to the Gentile world.

Other writers think they came from Arabia, because the gold, myrrh, and frankincense they presented to the object of their worship are the productions of that country. We confess to attach but little weight to this argument by itself; but when the geographical positions of Arabia and Judea are taken in connection with it, it has some force. Arabia, or at least a portion of it, lies south-west of Judea, and the inhabitants of the former country would therefore see the “star” in an easterly direction; while Persia is situated to the east of Jerusalem, so that to the Persians it must have appeared in the west; on the other hand, it is distinctly stated they came “from the east to Jerusalem.” These differences may, however, be reconciled if we are to assume, as we have a right to do, that the miraculous light first appeared in the eastern heavens, and that it travelled westerly, leading the travellers in that direction. Still there is no mention made of such a phenomenon till after the wise men had reached Jerusalem, and been commanded by Herod to “go and search diligently for the young child;” then “the star which they saw in the east went before them.”

Mr. Warren, as it seems to us, inclines to the Arabian side of the controversy, if the matter had his consideration. The figures in his drawing are certainly of that country, and are passing one of its numerous deserts. The picture, in the collection at Osborne, was purchased by the Queen from the New Water-Colour Society, of which the artist is President, in 1850.

NATIONAL ART
AND NATIVE ARTISTS.

THE SCUTARI MONUMENT.

THE Sardinian government have determined to erect a monument in honour of their late king, Charles Albert; and the Sardinian Chambers, affirming the design, have voted a sum of £25,000 for the purpose of having it carried into execution. Having, then, a commission of this importance at their disposal, the government of that country have felt themselves called on to remember that they have a *native sculptor* who has achieved considerable reputation; and, although that sculptor is an absentee from his country, and notwithstanding the disadvantage at which *they* are proverbially said to stand who are out of sight, they have thought it right to assign the work to the Baron Marochetti. Two propositions are maintained by this decision; both of which, we confess, affect us with a sense of their fitness. One is, that the national monuments shall be executed by national art; the other, that the national artist has a right to such encouragements and benefices as his nation has to bestow. Strangely enough, however, it is in this country the tendency of government action in the matter to ignore these important principles, and to reverse this sound and reasonable practice. In a nation rich beyond any other in the talent needed for this species of national illustration, and in the number of its Art-professors awaiting their rewards, it would seem nearly incredible that a valuable commission should have passed behind the backs of all the sculptors of England into the hands of a foreigner. Will no one so placed as to make his voice heard stand between our native artists and this official repudiation? Will no member of the Lower House of Parliament elicit for us some more precise and satisfactory information than we yet possess respecting the Scutari Monument, for which £17,500 was the other day asked from that assembly, and which has been silently given away to the Baron Marochetti? When was this commission assigned, and how? and why to a stranger, when we have amongst us sculptors who have year after year been building up great titles to such employments, and illustrating the country that thus neglects them by the production of works which place its sculpture at the head of the European schools. It is high time that there should be an end of this arbitrary dealing with the national commissions: it is fit that it should be made distinctly visible to the ministerial minds that our public works are not to be looked on as pieces of pocket patronage. It is idle to appeal, in answer, to commonplaces about the cosmopolitan character of Art; no undue jealousy of the foreign sculptor is involved in the sentiment that we have naturally the support of our own. That country overlooks one of its great means of self-illustration which forgets to foster its own Arts—a process not to be attained by overlooking their professors. As matters stand, Baron Marochetti gets properly the commission which his own country has to bestow on her son, and improperly that which our country takes from *her* sons to give to him. Again, we ask, will some one help us to a clearer understanding of this matter? and we ask it the more emphatically because there are other Art-matters waiting for decision which render a better understanding of the subject highly important to the interests of our own great English sculptors.

Since the above was written, the Earl of Harrington, in the House of Peers, asked some questions of the Government in reference to this painful and very humiliating “Monument;” but his lordship was ill informed on the subject—nor was his criticism very pointed or enlightened. He did, however, inquire—

“1. By whose authority the Scutari Monument had been undertaken? 2. Who had selected Signor Marochetti to undertake the work? 3. From what fund the payment was to be made? 4. Why the work had not been subjected to public competition, so that the sculptors of England, France, Italy, and Germany might have sent in models, and an obelisk have been produced that would have immortalised our warriors and the sculptor for ages to come.”

But his lordship made no remarks on the enormous cost of a very inferior work—a work that, we repeat, is unworthy of the subject, and not creditable to the

art of sculpture as it exists in England in the nineteenth century. If the Baron Marochetti desires to be considered a British artist (which he is not considered by the Sardinian government) we can take no pride for our country out of this production; and although Lord Panmure, in his reply, affirmed that “he had heard very little complaint about it,” we assert it to be an opinion, general if not universal, that any of our leading sculptors would have produced a work of far higher merit, and have been amply rewarded by one half the sum the Baron received. The answer of the noble lord is merely to the effect that Government ordered the work, commissioned Baron Marochetti to execute it, did not invite a competition (by which their “commission” would have been *nil*), and that when everything was done that ought not to have been done, they called upon Parliament for a grant to pay for it:—“Signor Marochetti having been selected because he was famous on account of some colossal works that he had executed.” Most unhappily, although every branch of trade and commerce, almost every imaginable “interest” is represented in Parliament, the Arts are entirely without this vast advantage. The most absurd opinions may be uttered, the most irrational dogmas promulgated, and the most disreputable “jobs” perpetrated there, without a single member raising his voice to expose or avert—aided by knowledge, experience, and courage. Surely an evil so manifest cannot endure much longer; surely some intelligent and enlightened nobleman or gentleman will stand in the breach.

In the course of his very restricted observations, Lord Panmure said, that “British sculptors declined to compete for public monuments;” who can be his lordship’s authority for so entire and inexplicable an error? When did British sculptors decline competition?—when and where? There are but two sculptors who have ever so declined—Mr. Gibson and Baron Marochetti! But Mr. Gibson is a resident in Rome, and the Baron very naturally believes success to be more certain without competition than with it. Upon this very important branch of the subject, the following letter has been published (in the *Times*) by E. H. Baily, R.A.

“SIR,—My attention has been called to a report which appeared in your paper on the 9th inst., under the head of Parliamentary intelligence, which is not only an error, but a statement which, if allowed to pass uncontradicted, may prove injurious to the interests of British sculptors.

“Lord Panmure, in reply to Lord Harrington’s inquiry for particulars relative to the Scutari Memorial, thus spoke of public competitions:—‘As to public competitions, the noble earl (Harrington) must be aware that the sculptors and artists of this country declined to furnish plans to compete for the erection of public monuments.’

“It may be—in fact I know that Mr. Gibson has long objected and refused to submit designs in competition, but I know of no other English sculptor who has declined to compete, although they have been strongly impressed with the injustice and partiality which most often attend this mode of selection; and I have yet to learn that Mr. Gibson is the representative of British Art and sculptors.

“Lord Panmure says,—‘The noble lord (Harrington) must be aware that the sculptors of this country decline to furnish designs.’ Can Lord Panmure, Lord Harrington, or any other noble lord, say there was want of response by the British artists for the Nelson Testimonial? Or can it be said that British artists declined to compete for either the erection of the Parliament houses, or, more recently, for their decoration? Did they not cordially reply to the invitation of the city in the cases of the Peel and Wellington competitions? And lastly, did not two British sculptors out of four selected (one being a foreigner and the other Mr. Gibson) submit designs for the Government Wellington Monument, and, although rejected, offer again and again to provide other works? I, for one, never heard of the Scutari Monument until I read in the public papers that it was completed, and I may say that, had I been applied to, I should most readily have met the views of the government, and have been proud to have done so for the honour of England’s arms and Art.

“I have the honour to be, Sir,

“Your obedient humble servant,

“E. H. BAILY.”

“11, York Place, Portman Square.”

IF WARDEN PINX?

THE STAR IN THE EAST

FROM THE PICTURE IN THE ROYAL COLLECTION

LONDON: PUBLISHED FOR THE PROPRIETOR

THE EXHIBITION OF ART-TREASURES IN MANCHESTER.

HIS ROYAL HIGHNESS PRINCE ALBERT has addressed the following letter to the Earl of Ellesmere, in reference to the Exhibition which is to take place at Manchester in 1857. It is a most lucid and judicious communication—another proof that whenever the Prince brings his mind to bear upon any subject, he thoroughly comprehends it: the course he advises is generally the best; he seems to know almost by intuition that which others acquire by experience and study; and it is beyond question, that if the Arts of this country already owe him a large debt, that debt is certain to accumulate. It is a privilege of no common order to be guided by the counsel of a man so wise and good; who, occupying the highest place in the realm, has thought and consideration for all that concerns the true welfare and surest interests of the country. There can be no doubt that the Manchester Committee will act upon the suggestion of the Prince; they may thus obtain a collection of pictures such as have never been seen together; for it is notorious (and we have even better evidence than that of Dr. Waagen) that if our National Gallery be comparatively poor, there are Art-treasures scattered throughout England that, collectively, would form a richer and more valuable assemblage than those presented by any three public galleries of Europe combined. If the best of these can be obtained—and we imagine the letter of the Prince in a great degree removes all difficulty—the Exhibition at Manchester will be for ever memorable in the history of British Art. The following is the letter of His Royal Highness:—

"MY DEAR LORD ELLESMERE,—I was very sorry not to see you with the deputation from Manchester that came to me yesterday upon the subject of the Exhibition of Art-treasures which it is proposed to open in that city in May, 1857. Lord Overstone, however, as well as the other members of the deputation, left nothing to desire in explaining the objects which they have in view. I could not fail to admire the public spirit which had prompted the people of Manchester to enter upon so large and magnificent an undertaking.

"We had a good deal of discussion upon its general principles, upon the soundness and fitness of which much of its future success must necessarily depend.

"Manchester enters upon this undertaking at a certain disadvantage. It has been preceded by the Exhibition of 1851, that of Dublin in 1853, and that at Paris during the last year. That a mere repetition of what has thus gone before would fail to attract sufficient notice and public support appears to have been felt by the Committee; and they most wisely gave a distinctive character to their scheme, by making it an exhibition of what may emphatically be called the Art-treasures of this country. How to succeed in collecting such treasures, fondly cherished as they are by their owners, who are justly jealous of their safety, is the problem to be solved.

"In my opinion the solution will be found in the satisfactory proof of the usefulness of the undertaking. The mere gratification of public curiosity, and the giving an intellectual entertainment to the dense population of a particular locality, would be praiseworthy in itself, but hardly sufficient to convince the owners of works of Art that it is their duty, at a certain risk and inconvenience, to send their choicest treasures to Manchester for exhibition.

"That national usefulness might, however, be found in the educational direction which may be given to the whole scheme. No country invests a larger amount of capital in works of Art of all kinds than England, and in none, almost, is so little done for Art-education. If the collection you propose to form were made to illustrate the history of Art in a chronological and systematic arrangement, it would speak powerfully to the public mind, and enable, in a practical way, the most uneducated eye to gather the lessons which ages of thought and scientific research have attempted to abstract; and would present to the world, for the first time, a gallery such as no other country could produce, but for which, I feel convinced, the materials exist abundantly in private hands among us.

"As far as painting is concerned, I enclose a catalogue exhibiting all the different schools, with the

masters who illustrate them, which able hands have compiled for me, and which was communicated to the National Gallery Committee of 1853, and printed by them with the evidence.

"If such a catalogue, for instance, were to be filled up with the specimens of the best paintings by the different masters enumerated in it which exist in this country, I feel certain that the Committee would come with very different powers of persuasion, and a very different claim to attention to their owners, than when the demand for the loan of certain of their pictures were apparently dependent upon mere accident or caprice.

"A person who would not otherwise be inclined to part with a picture would probably shrink from refusing it, if he knew that his doing so tended to mar the realisation of a great national object.

"The same principle might be adopted with regard to the other branches of Art, extending even into the field of Manufacturing Industry.

"Whatever may be the decision of the Committee, I assure you that it will give me the greatest pleasure to give you any feeble assistance or support which I may be enabled to render; and I may at the same time repeat to you the assurance of the Queen's best wishes for the success of your labours.

"Ever yours truly,

"ALBERT."

"Buckingham Palace, July 3."

"The site of the building has been fixed at Old Trafford, about two miles from the Manchester Exchange, lying contiguous to the Botanical Gardens, which will form an agreeable promenade in connection with it. The total ground covered by the building will be 15,273 square yards. The front, which has been designed by Mr. Salomons, a local architect, will be of red and white bricks, and the sides of cast and corrugated iron, which latter material, in combination with glass, will also be used for the roofs."

Drawings of the building have been shown during the month at Messrs. Phillips, the eminent jewellers, in Cockspur Street. Without being remarkable for novelty or beauty of design, it appears to be well suited to the object in view—and if not handsome, is certainly not the opposite. It seems to be in all respects satisfactory.

It is not, however, without much regret we learn that the Industrial Arts are not to be represented by this great gathering of 1857 in Manchester. This decision has been probably arrived at mainly in consequence of the long announced intention of "the Manchester Mechanics' Institution" to hold such an exhibition in the autumn of 1856. To this always interesting and important topic we shall presently refer.

Frequent occasions will be supplied to us of communicating with our readers concerning the progress of the Directors of "the Exhibition of Art-Treasures in Manchester;" meanwhile, we cordially and hopefully wish it success.

We may now express a hope that the Committee, having taken a wise step in reference to pictures, will consider also how sculpture can be best represented—modern sculpture, that is to say. It will readily occur to them that, scattered about the building in appropriate places, works of this class will not only be seen to advantage, but add materially to its general effect, giving grace and interest to the Exhibition. We trust our British sculptors will make early preparations for the call that no doubt will be made upon them; and we have no fear of their thus establishing their supremacy, and supplying the most emphatic proofs of their right to such patronage as the nation can supply. They may never again have so valuable an opportunity; let it not be lost.

We may respectfully offer a word or two in reference to a very essential matter. The Exhibition at Dublin betrayed a lamentable want of care, in regard to the pictures, &c., entrusted to the Committee; we do not dwell much on this point, for we have no desire to create alarm. The gentlemen who undertake the trust in Manchester are practical men of business, while those of Dublin were not; they will incur—and willingly incur—a heavy responsibility: let them give ample assurance that, in this respect, no contributor need be uneasy concerning the issue.

MECHANICS' INSTITUTE, MANCHESTER.

EXHIBITION OF ART AND ART-INDUSTRY.

THE MECHANICS' INSTITUTE of Manchester is a new building, commensurate with its augmented numbers and increased requirements: that building it is proposed to inaugurate by "an Exhibition illustrative of the Fine Arts, Antiquities, Scientific Inventions, Raw Materials, Industrial Products, Machinery at rest and in Motion, and comprising Selections from Mechanical Employments in actual operation," such Exhibition to be opened in September next.*

We rejoice to learn that what the Exhibition of 1857 is not to do, will be done by this Exhibition of 1856—viz., to collect productions of Art-Manufacture; hence, to show its progress, and hence, to promote a most essential branch of Art-education. Circulars have been issued by the Directors, requesting loans of all kinds; and we understand a large proportion of our leading manufacturers have responded to the call made upon them—first, in order to promote the interests of a most valuable Institution, that has existed more than thirty years, and achieved an immense amount of good; and next, with a view to inform the public—rightly and properly—who are the producers who best minister to public wants. We earnestly hope this good cause will be upheld, and that the Directors will receive such liberal aid as may essentially assist them in their very meritorious undertaking. After all, unless the Artisan be properly taught, little real service can be rendered by those who teach. It is in this respect mainly that France excels England; there the workmen—"the mechanics"—are made to understand the nature and fitness of what they undertake. It is to their intelligence the world is mainly indebted for results that in certain classes of produce keep exclusively to them the markets of the world.

We rejoice to know, then, that in Manchester there is again to be an Exhibition of Art-Industry; and that this portion of the design is to be a main purpose. No doubt the Committee are aware that many serious difficulties will have to be met and encountered. Producers generally will be averse to exertions unless some steps be taken to overcome objections. The only case in point is the Exhibition which, in 1853, took place in Dublin; it followed perhaps too soon upon that of 1851, and it was notoriously ill-managed. We have no desire to enter into this matter now, but unquestionably the whole affair was a series of mistakes, "confusion worse confounded;" and the result was a serious pecuniary loss. The Exhibition which occurred in New York was worse than failure—it was prejudicial, and not serviceable, to all who in England took part in it. That of Paris, however, was a success, and is likely to lead to very beneficial consequences; it was a first great step to that free-trade which must ultimately secure the great interests of the world, and especially of France and Great Britain. But there will be an indisposition on the part of our leading manufacturers generally to aid the views of the Manchester Committee, by making arrangements commensurate with the magnitude and value of the occasion. We hope the Committee have considered how this difficulty can best be met.

To see a collection of fine and rare pictures will be no doubt a boon of magnitude to the people of Manchester, and the immensely populous district that surrounds this great city of industry; but a gathering together of objects of manufacture, and of Art-manufacture especially, will be infinitely more instructive—more permanently and practically useful.

For ourselves, we shall gladly aid and assist it by every means in our power, and, we trust, with advantage to the Committee and the contributors. It was in Manchester, so far back as 1846, that we commenced the task we have since so often repeated—of

* "The floor space in the building, applicable to the purposes of the Exhibition, exceeds twenty-one thousand square feet, with the additional accommodation afforded by the walls for the display of Paintings, Engravings, &c. With this space at their disposal, and with the experience the Directors possess of the successful working of similar Exhibitions in this Institution, they confidently hope to collect materials, and arrange an Exhibition which will sustain the reputation of the Institution, and be not only an object of general attraction, but an important educational instrument throughout the densely populated district, of which Manchester is the centre."

reporting and illustrating works of Art-industry: in England that is to say; for previously, in 1844, we had published an Illustrated Report of the Exposition of Industrial Arts in Paris; and, in 1845, the *Art (Union) Journal* contained, under the title of the "Mercantile Value of the Fine Arts," a report, with many engravings, of the Bazaar at Covent Garden, which, although it took place in order to raise funds for the Anti-corn Law League, was so liberally supplied with contributions from manufacturing localities as to be in reality an exhibition of Art-Manufactures; and it no doubt led (as at the time we said it would do) to the consideration of schemes in which the example of France might be followed by England.*

The Illustrated Report of the Exposition of British Industrial Art at Manchester at the close of the year 1845, published in a supplementary part of the *Art (Union) Journal*, contained a hundred engravings. It was a fair and sufficiently ample report of the first attempt in England to follow in the footsteps of France. And it is to the honour of Manchester that it took the lead in a course which subsequently, in 1851, delighted and instructed the world. Then, as on all occasions, we laboured to show that England was capable of rivalling France in collecting together a display of Art-manufacture, urging upon all who had power, the duty of their adequate representation in England. In 1851 we had the happiness to receive our reward in witnessing an exhibition infinitely beyond our hopes. We rejoice, therefore, that after a lapse of twelve years Manchester will make another effort; and we hope and trust British Industrial Art will be, on that occasion, as largely and liberally represented, patronised, and protected as it was in 1845—in due proportion, that is to say, for Art-industry was then in comparative infancy in England. The benefit of publicity was more than doubted by producers—it was a novelty they could not understand; there was no royal or aristocratic influence to support it—no "guaranteed fund" to meet expenses; it owed its existence, its sustenance, and its results to a few enterprising and enlightened men, and by them the cost and consequent loss was borne exclusively.

We hope and believe that the issue, in 1856, will be as honourable to the conductors, to the city, to the contributors, and to the public, as was the winter of 1845; but, we repeat, in due proportion to the means that may now be commanded to obtain a more brilliant and a more useful success.

We do not lose sight of the fact that the results of the Exhibition at the Manchester Mechanics' Institute, in 1856, will be infinitely more important than were those of 1845; for the prosperity of a very useful and long-established Institution will in a great degree depend upon the success arrived at. The building is, we understand, one of an admirable character—properly arranged for all requirements: it is costly, of course, in proportion. And if this Exhibition be what it may be, and ought to be, it will relieve the Committee and the Society of a heavy responsibility. This may be a narrow, but it is a necessary view. We sustain the Exhibition also on higher grounds: those who contribute to it will—while they extend their own repute, and thus advance their own interests—have the satisfaction of knowing they are largely promoting the true welfare of a class which may be almost described as the *most* important class of the community—the operative class, the workmen, the "mechanics,"—who, if rightly instructed, trained to good order, properly encouraged, and justly rewarded, may be safely considered and described as "the pillars of the State."

* "A National Exposition in London would attract visitors from every quarter of the globe; and the rent which manufacturers would gladly pay for the use of the space necessary to the display of their goods would more than cover the cost, even if admissions were gratuitous. Such a project is worthy the combined efforts of the Board of Trade and the School of Design. They would be nobly supported by the country, and the Temple-Palace of British Industry would surpass anything which this world has ever witnessed. A more perfect National Exposition of the products of British Industry would lead to the display of high and noble feelings with greater intensity and wider extent. It is for this reason chiefly that we so strenuously urge the project. We value taste, we esteem industry, we love every form in which intelligence embodies ideality; but, above all, we estimate the influence of artistic beauty in developing emotions of moral loveliness, and the influence of the triumphs of Britain's industrial prowess in strengthening every man's interest in the prosperity of the British nation."—*Art (Union) Journal*, 1845.

A NYMPH SURPRISED.

FROM THE STATUE BY E. G. PAPWORTH, JUN.

WITH the knowledge we have of the present condition of sculpture in this country, we cannot but feel a considerable amount of regret, acting as an alloy to our pleasure, whenever we mark the appearance of a young sculptor whose talent is of such a character as, under ordinary circumstances, would fully justify his continuance in the profession. Nothing, we are persuaded, but a love of the art which he finds it impossible to restrain, would induce any young man to enter upon a career that, even under the most favourable conditions, must be one of infinite labour, difficulties, and disappointment. And how much are all these increased by the present aspect of our school of sculpture with respect to the patronage it receives, and the hold it has upon the minds of those who alone are able to help it forward? For what are the facts which come within the cognisance of every one who interests himself at all in Art-matters? A few of our leading sculptors receive commissions from Government for works at prices which, in comparison with the productions of other artists, and with the profits realised by an active, "pushing" tradesman, leave him but a scanty income; and occasionally from private patrons on scarcely more liberal terms. But by far the larger majority cannot boast of even this niggardly amount of patronage. Year after year, clever and even beautiful models in clay—for speculative marbles are too costly to be executed by men who have only their own head and hands to assist them—are produced, exhibited, and then returned to the studio, only to add to the disquietude and chagrin of the disappointed artist. We have said such works are "exhibited"—they are not; they are admitted within the walls of the Academy, and then placed in a room where, like the poor fellows in the "Black Hole" at Calcutta, they smother each other. The Academy is not altogether to be blamed for this, though we are satisfied arrangements might be made throughout their rooms by which the sculptor might stand a chance of having his works seen. For instance, a line of statues, enclosed within barriers, could be formed along the centre of the great room, a part rarely occupied by visitors. Statues might also be arranged, without any great obstacle to a proper inspection of the paintings, at certain intervals in the other rooms. However, this grievance will, we trust, continue but a little longer. The plan in agitation for giving up, on certain conditions, the whole of the edifice in Trafalgar Square to the Royal Academy, will enable that body to afford the sculptor the space to which he is entitled for the suitable exhibition of his productions.

Our other complaint on behalf of the sculptors still remains in full force, and, we fear, will so remain till public opinion forces upon Government the claims of our own artists to its primary consideration, and the wealthy patron of Art shall learn to notice sculpture at least as highly as he now estimates painting. We have seen within the last month a nobleman purchasing a single picture at the cost of £4500, or thereabouts—a work of which, whatever its merits may be, time in a century or two will in all probability leave little else than the bare canvas. Now this sum would have procured its possessor three, certainly, of the most beautiful sculptures of modern times—works that, carefully preserved, would endure for ever. We confess ourselves quite unable to comprehend this prodigal outlay upon one art, and the total indifference to another.

These remarks, although not bearing on the subject immediately before us, have arisen out of it. Mr. E. G. Papworth, jun., the sculptor of the statue here engraved, is a young artist, who was fortunate in getting a commission for the work from the late Mr. J. Neeld, M.P., one of the very few of our wealthy countrymen to whom our sculptors have been indebted. But Mr. Papworth's case is an exception to the general rule, and is therefore no argument against the foregoing observations. The statue, exhibited this year at the Academy, possesses merits which are an earnest of greater things for the future. The "Surprise" is created by a hawk having fallen at the feet of the nymph with its prey in its talons.

THE SKETCHER.*

ALL lovers of Art—who is the lover of Art who is not also a lover of nature?—all lovers then of Art and nature have, or ought to have, made the spiritual acquaintance of "The Sketcher," in the pages of *Blackwood*. "The Sketcher" was also a contributor to this Journal, but we believe, for years before his death, he had written but little on Painting. We had expected long ago to have seen these papers gathered into a collective form; truly the harvest is late, but the fruit has all the freshness and fragrance of nature. We read these papers with pleasure, as they appeared periodically in *Blackwood*, and we read them again with increased pleasure, because we meet with so little that is readable on the subject. "The Sketcher" was not an exhibitor, therefore he was known but to few beyond a certain circle; he was not a professional artist, but should have been one. The Rev. John Eagles was born at Bristol in 1784, and was placed at Winchester about the age of thirteen, whence he was in due time removed to Wadham College, Oxford, where he evinced that love of Fine Art which he cherished till the latest period of his life. He took his degree in Arts, and entered holy orders, and at an early period settled into domestic life. His first curacy was that of St. Nicholas, Bristol, to which he was appointed by the Rev. John Eden, the vicar. In 1822, he removed to the curacy of Halberton, in Devonshire, where he resided for twelve or thirteen years, during the last five years of which period the Rev. Sydney Smith was his rector; and it may be remarked that, at the time of his decease, he was engaged on a review of the works of that remarkable man. From Halberton he removed to the curacy of Winford, near Bristol, and thence to Kinnersley, in Herefordshire; but, in 1841, he relinquished parochial duty and returned to Clifton, where he resided till his death, in November, 1855. His contributions to *Blackwood's Magazine* were not confined to papers on Art, but comprehended also compositions on classical subjects, as well in verse as prose, and also essays on the topics of the time; his connection with *Blackwood* extended over a period of twenty-five years. The essays, which are now collected into a volume, are those which immediately interest us; the book bears the same title, "The Sketcher," which headed the papers in their periodical form, but the date assigned to their appearance is incorrect. They are said in the Introduction to have been "written in 1833, and the two following years." If this means that they were written and published then, as may be inferred from the statement, it is we think wrong, because we remember their appearance ten or twelve years later than this. We confess never to have seen anything painted by Mr. Eagles; it would be satisfactory to be acquainted with his works, although, without such acquaintance, it is not difficult fully to estimate his powers and understand his aims. In the brief prefatory memoir of him it is said, "His painting was a kind of hieroglyphic poetry. No artist ever loved Art more purely and entirely for its own sake. And it was a subject of regret to his friends that the exercise of the faculty of painting was in itself frequently sufficient to him as an end, and that he was himself so indifferent to the value of his own productions, that he would paint pictures one upon another, so that the same canvas bore upon its surface many pictures, no less characteristic and beautiful than the last, which disguised or hid the rest." To the friends of "The Sketcher" these records seemed worth preserving; but they had not the same value in the eyes of Eagles himself. It would never have occurred to an artist to make this observation, because every painter has expunged or cast aside the products of months—of years of labour. Not very long ago we were turning over in the studio of an eminent painter a store of long forgotten and musty sketches, when, to an observation on the merit of some of them, the guardian of the studio observed, with even more assumption than Brummell's man, "All these, sir, are *our* failures."

With respect to his feeling, his biographer proceeds to say:—"His style was formed on the great Italian masters of landscape; amongst others Gaspar Pons-

ENGRAVED BY E. ROFFE FROM THE STATUE BY E. G. PAPWORTH. JUNR.

sin, and Salvator Rosa, enjoying to the last his admiration and respect. He held that almost every beautiful scene in nature contained in itself many pictures, but that there existed generally one which was more living and forcible than the rest, which it was the business of the artistic eye to select and appropriate. He even wished, if it were but by a few broad dashes and sweeping lines, to seize and secure on paper and canvas this soul of every scene." From this passage it is at once understood that, although "The Sketcher" was a student in the school of nature until the end of his life, he was yet in practice attached to the Art-philosophy of the older English school of painting.

Years ago, when we read these papers, we envied their author his elysium of Art—he has spent his life amidst all that is lightsome and gladsonic. His precept was to give his scenes the charm of the *dolce far niente*; if the god has denied us the *otium*, we are to make it for ourselves, and our scenes are to be such as shall induce Astræa again to take up her abode among us. A painter of dooks and thistles is not a landscape-painter, and less is a painter of styes and barns. Repose, and repose alone, is the beauty of the landscape, which in every other essential should be a poetical shelter from the turmoil of the world; and should there be any earthly and discordant element, its proportion should only be as much as should show our fancied *auræa regio*—our golden home—a debatable land between the land of faëry and the every-day hardware world. "The Sketcher" does not spare Turner, and the *servum pecus* who followed him, in speaking of pictures that make you long for a parasol, put you in fear of yellow fever and a suspicion of jaundice—scenes assuming to be subjects painted after the poetry of the elves, as hot as capscum, where any Undine would be driven off in steam in an incredibly brief space. It is, then, nature in her middle tones that "The Sketcher" most admires; he praises the sobriety of Poussin, and the severe grandeur of Salvator. For ourselves we are not so exclusive; we can walk with Vanderneer in the moonlight, and listen to the whisperings of the prophetic stars—though Dutch they be; we can sit in "pleasant harmonic" with Albert Cuyp, even on the banks of the Dort, without wishing his canvas a whit less warm; or pass a Venetian *après-midi* with Turner, even in his sunniest hours, without wishing for a diminution of sunshine, even by one ray. As an example of Mr. Eagles' enthusiastic manner of writing, on material immediately available to the artist, we extract the following:—"Beautiful June! why is it that all painters have failed to represent the many green hues of this luxuriant month? In the early part of it, I spent some time in study among the woods opposite Clifton. They are, as I have stated in a former paper of 'The Sketcher,' the very best painting ground of a close kind. Their peculiarity of form and character I have before described; but I cannot now forbear remarking that I never was before so forcibly struck with the greens; they were of all shades, but rich as if every other colour had by turns blended with them, yet unmixed—so perfect in predominance was the green throughout; so varied likewise was the texture, whether effected by distance, by variety of shade, by opposition, or by character of ground. There was much of the emerald—not in its colour only, but in its transparent depth. The illumination, brilliant even under the shadows of the trees, in the hollows and fern-covered ascent, under the foliage, was most lovely. There, amid the depth of wood, the tall thorns, with newly-assumed elegance, mingling their blossoms, fresh and white, here in masses, there in dots, like diamond, pearl, and jewellery over a regal mantle of green, yet all with such modest dignity, and, if the expression be allowed, such affection, interweaving and interspersing the innocent gaiety; and here, retiring into the depth of shade, relieving and making the depth still deeper, yet delighting—yet delighting, as the Latin happily expresses it, *consociare*—rendered the smaller passages complete pictures. Bring the critic to this test, and mark how nature will laugh at him in her pleasant mockery, and bid him unfold the bandage from his eyes." *Euge!* excellent Sketcher! Pontifex Maximus of Pau and the Nymphs! here we are in the splendid temple of the Dryads, inimitable by the hand of mortal man: where is the sculptured acanthus like that glorious coronal of verdure, one leaf of which you could not withdraw without derange-

ment to the entire composition? Where is the Corinthian shaft like yonder pine trunk, with its red sealy rind mocking the mathematics of all plated monotonies? It is nothing to us that one Mindert Hobbima had a lark for his bedfellow to whistle him up before twilight broke into morn, who breakfasted on brown bread, and drank his earliest draught from the cups of the dew-distilling leaves: it is nothing, we say, that Mindert Hobbima has worshipped in the greenwood by sunshine and moonshine, by sober day and every other kind of light—after all, and sad to say, he is but as a donkey cropping thistles; and yet, only tell us where Mindert Hobbima was buried, and we should yield to none in ardent expression of veneration for his sylvan dust. Then there is his master, Ruysdael, by no means so good; and also Claude, working foliage according to the old prescription—mass upon mass, light upon dark, and *vice-versâ*. "The Sketcher" places before us one of the most difficult propositions in nature—photography is even at fault here; for, to say nothing of colour, the exceedingly delicate gradations of tone are wanting. We cannot proceed *per saltum*—by octaves, but we have an extensive range, from great depth to the unattainable coruscations of the sunlight. These wooded passages are always painted hopelessly flat; few things are more difficult than the determination of distances—that is, the proper relief of foliage masses, and the assignment of its place to each bouquet of leaves. Sketching in this case is of no use; nought availeth save industrious drawing and honest painting—day after day, nay, week after week, will scarce suffice for one exacting and inexorable study: any studio picture, painted from a half-hour's memorandum, were but a sorry mockery. And with respect to colour, trees have been painted of every hue—black, brown, yellow, red, and even blue; this variety, however, is gradually diminishing: yet in their attempts at green, the artists of the living school frequently fall into a cold metallic hue unlike anything in nature. Will the conventionality of tree-painting ever rise into natural representation? We are not told that our author made a sketch of the subject he so well describes—and he was right. We always thought these papers wanting in practical precept; the writer is most eloquent upon natural phenomena, but each paper should have been seasoned with a little practice. Yet he has his discovery to communicate; and although the day for the trial of new "vehicles" and texture surfaces be gone by, we will describe in "The Sketcher's" own words his process of making a copy with his starch medium:—"Having to make my priming, I wanted a substitute for glue. For this purpose I mixed up a quantity of colour, of red lead and chalk, with starch, and added to it, mixing it all up together with the spatula, such a quantity of linseed oil as I thought would fasten it. With this I made my priming, and painted my copy with the medium supplied by my scientific friend. The canvas was, however, bad, I must confess, and gave me a good deal of trouble, not from this mixture, but from other causes, and I was not satisfied with my copy. I determined to attempt a second; to accomplish this in time it was requisite to have something that would dry very fast. Finding the ground I had made of the priming to be very firm, I thought of using the same medium for my painting; and after a few trials on a small scale, which were all more or less satisfactory, I begun my picture thus:—I had some starch made into a gelatinous state, and with the palette-knife mixed up with it a quantity of nut oil, perhaps two-thirds starch. With this I painted in the sky at once; it worked very freely and pleasantly, and looked so fresh and unlogged with oily matter that it was quite agreeable to the eye, and I could not help thinking it looked very like the Venetian method of getting in a picture, such as we find observable in Paolo Veronese. I should mention that I used no bladder-colours, but with this medium mixed up all my colours in powder. I then proceeded in the darker parts of the picture, for which I used less starch, and found in the process that it was best in its less gelatinous state, and that perhaps, for general use, it was best to have the starch made only so strong as just to escape being gelatinous: thus, as a fluid, it mixed better with the oil, and the proportion of equal quantities of each; it should be well mixed up with the palette-knife, and it becomes whitish or creamy in the mixing." This is the pith of the

communication; but starch and other materials have been repeatedly tried; but in what have they resulted? There are other qualities wanting in pictures besides durability; we know of hundreds of works which, had they mouldered into dust centuries ago, it had been better for Art. Again, in speculating upon media and varnishes, he says:—"The old masters used some colours which we cannot—verditer, for instance; with our oils it will change in a few days, and so of other colours. I have heard picture dealers declare that they can easily get off the paints or retouches a century old, by a process which will not touch the older. Now, these facts are grounds for inquiry; much valuable matter might be accumulated, and successful experiments made. Sir Joshua must have seen something he did not possess, or he would not have destroyed old pictures to find out the medium wherewith they were painted." Had "the Sketcher" been a professional painter, he would have given but little attention to speculation on the so-called secrets of the early painters. Reynolds believed in some alchemy known to the old masters; but simplicity in all things is the last and really the dearest lesson we learn. In what condition are now those productions of Reynolds which he himself complacently noted as successful experiments with this or that golden nostrum? They are either in tatters, or have been long since repainted by other hands. But these papers were written in the days of the vehicle mania. We have read them, we repeat, with renewed pleasure; but let not the tyro suppose that he will find elementary instruction in them—they are addressed only to experience; but so meaningless and incompetent are most recent essays on Fine Art that have fallen in our way, that we rise from the perusal of these with a double sense of gratitude.

PICTURE SALES.

ON Thursday, June 26th, Messrs. Christie and Manson offered for sale the gallery of pictures, about seventy in number, known as the "Wolterton Collection." They were the property of the Earl of Orford, and had been removed to the rooms of the auctioneers from his lordship's seat at Wolterton, Norfolk. The collection included specimens of the Italian, Spanish, French, and Dutch schools, with a few examples of our own. Several of the pictures bore a high character among connoisseurs, and this attracted a large and distinguished company to the sale. It is only necessary we should note down the most important of the paintings, with the prices they realised.

A Court-yard in Venice, with Figures in Galleries, supported by Columns, extraordinary in perspective, and brilliant with sunlight, 160 guineas; 'The Staircase of the Doge's Palace, Venice, with a Cardinal and other Figures,' equalling, if not surpassing, the former in power and effect, 240 guineas. These two pictures were painted by CANALETTI, so we heard, for Count Alboretti, of St. Petersburg, and were purchased by Lord Orford from the executors of the count. 'Two Peasant Children,' by OPIE, 310 guineas, a richly-coloured work, and excellent in composition, that would do honour to any school—we were well pleased to see it estimated at its real worth. 'Amateurs performing the "Merchant of Venice" before a Party of the Aristocracy at Lord Mansfield's,' ZOFFANY, 140 guineas; 'Italian Landscape,' painted by SIR C. L. EASTLAKE at Rome, in 1829, 170 guineas; 'St. Mark's, Venice,' CANALETTI, 260 guineas; 'The Front of St. Mark's Church, from the Piazza,' CANALETTI, 274 guineas: both of these pictures are in the artist's best manner. 'An Italian Landscape,' by BERGHEM, who has introduced into it a peasant in a red dress, two cows near a pool of water, a man on a mule, and figures on a road rising below a rock: this picture is in the finest condition—the colouring pure and silvery, its general treatment elegant, and delicate in finish. The canvas is by no means large, but it realised 470 guineas. An Altar-piece, by GIOVANNI LO SPAGNA, representing the Virgin in a red dress and blue drapery, enthroned on the clouds with the infant in her lap and a lily-branch in her hand. She is surrounded by angels; and seated below her are two cherubs with musical instruments.

The works of Lo Spagna, the contemporary of Raffaele, are exceedingly scarce in England. Speaking of this picture, Dr. Waagen says, "It is noble in feeling, and graceful in motive; the most important I have yet met with in England by this rare master, who has so much affinity with the earlier pictures of Raphael." It was purchased at the sale for our National Gallery for the sum of 620 guineas. A figure-subject by REMBRANDT, called 'The Converted Jew,' by no means a good specimen of the master, was sold for 140 guineas. The convert is standing with his hands folded; an open Bible lies on the table before him; he wears a yellow dress and black cloak, and his head is covered with a white and gold turban. A 'Coast Scene,' by RUYSDAEL, with a storm effect. We have no doubt that this was once a brilliant picture, but it has become so black that we had some difficulty in making out the details of the subject in several parts: moreover, it has been damaged in two or three places; still it realised 300 guineas. Dr. Waagen calls it "highly poetical, and of astonishing effect." 'The Duchess d'Ossuna,' attributed to VELASQUEZ, but certainly unlike the female portraits we have seen from his hand, 170 guineas. An Altar-piece, with laterals, ascribed to MATILEUS GRUNEWALD, an artist of the early German school. In the centre is the Virgin, in a green and blue drapery, enthroned on the half-moon, between St. Catherine and St. Barbara. She is offering some grapes to the infant Christ, whom she holds in her lap, while angels above are crowning her. On the inside of the laterals, or wings, are St. Ambrose in robes, and St. George in armour, standing on the dragon: on the outside, St. George, St. Clement, and a third figure. We again quote Dr. Waagen, who says, "This is the only picture by this great and rare German master that I know of in England; it displays in full measure that nobleness and grandeur of heads and figures, good style of drapery, and powerful and clear colouring which are proper to him." It sold for 130 guineas. 'A Dutch Landscape,' by PHILIP DE KONINGH, a large and coarsely-painted work, but with an extraordinary effect of sunshine, 390 guineas. 'Christ falling beneath the weight of his Cross,' MURILLO, a picture so full of deep religious feeling, such intense expression of pain and sorrow, and so delicate and transparent in colour, that in our humble opinion it is worth all the rest of the collection *en masse*; we have rarely, if ever, seen a picture that so impressed us with the idea of the sublime: it was knocked down for 600 guineas. 'The Rainbow Landscape,' RUBENS, one of a pair formerly in the Balbi Palace, at Genoa; the other is now in our National Gallery. We had heard so much of this celebrated picture, that we expected a rich treat when we attended the private view of the collection of which it was considered the greatest ornament, no less than it is thought by many connoisseurs to be the *chef-d'œuvre* of the master; but we admit we were woefully disappointed; the picture will bear no comparison with its *quondam* companion now in Trafalgar Square, nor with the 'Farm at Laeken,' the 'Summer,' and the 'Autumn,' by the same painter, in the collection of the Queen. The composition is good, and that is all the praise we can award it; in our judgment all other attributes of good painting—drawing, colour, and expression—are manifestly deficient. Lord Orford bought it, we believe, at the sale of Mr. Watson Taylor's collection for 2600*l.*; it was knocked down to the Marquis of Hertford, as we heard, on the present occasion for 4550*l.*—some one, on behalf of our National Gallery, bidding as high as 3800*l.* for it, at least it was so reported in the room. We rejoice that in this case a private purse was heavier than the public one; but even the lower sum would have been monstrous for such a work. The last picture in the catalogue was the 'Marriage of St. Catherine,' by SASSO FERRATO; the figures life-size, and altogether a work of considerable importance with reference to its peculiar character. The Marquis of Hertford became the possessor of this also, at the price of 1025 guineas.

The whole of the Wolterton collection realised 11,500*l.*: it may be called the winding-up sale of the season, for though other pictures have more recently been offered to public competition, they were not of a character to call for any special notice. Looking at the prices which paintings, both ancient and modern, have realised this year, artists and collectors need not complain.

ART IN THE PROVINCES.

STIRLING.—A meeting, at which nearly 10,000 persons assembled, was recently held in Stirling, for the purpose of taking measures to raise a national monument to the memory of Sir William Wallace, to be erected on the summit of the Abbey Craig, near that city. The design for the monument is to be submitted to public competition among native artists—that is, we presume, Scottish artists: if so, the example is one which it would be well for us who live south of the Tweed to follow, whenever a national testimonial in honour of some distinguished character is proposed: so far, that is to say, that it should be the work of a *British* artist, from whatever part of the United Kingdom he may chance to come.

NORWICH.—The annual distribution of prizes to the pupils of the Norwich School of Art took place on the 3rd of July, the Mayor, Mr. J. G. Johnson, presiding on the occasion. At the same time, the Report of the Committee for the past year was read to the visitors: from this document we learn that the attendance of pupils, and their general progress, are of a nature to afford entire satisfaction to those who interest themselves in the welfare of the school. The male public class now includes 122 pupils, and the female public class 16. There are also 32 in the male especial and intermediate classes, and 29 in the ladies' class: the total number of pupils, therefore, is now 199. At the recent exhibition in London of drawings and designs from the Schools of Art throughout the kingdom, the pupils of the Norwich School carried off a greater number of prizes, in proportion to the population of the city, than any similar institution elsewhere. The scholarships were awarded thus:—Mr. Gurney's, M.P., of £20, to George Easter; Mr. Warner's, M.P., of £12, to James Reeve; Mr. R. Chamberlin's, of £10, to H. E. Blazeby. Prizes given by Mr. Claude Nursey, head-master of the school, were awarded to James Reeve and J. Huggins, for the most regular attendance. The next Fine Art Exhibition in Norwich will be opened in the month of October.

CHELTENHAM.—A testimonial which must have been most gratifying to the noble recipient, the venerable Lord Northwick, has recently been presented to his lordship by the inhabitants of Cheltenham and its vicinity. Lord Northwick, as many of our readers are aware, is one of the most liberal patrons of Art of modern times: his mansion, Thirlestane House, near Cheltenham, is filled with pictures of all countries and periods; consequently, it is one of the "lions" of the town—especially as the inhabitants and visitors are permitted free access to the galleries on frequent and suitable occasions: it was to testify their sense of his lordship's courteous liberality that the testimonial was presented to him. Nothing could have been more appropriate to the occasion. Lord Northwick, surrounded as he is by such an infinite number and variety of beautiful works of Art, paintings, sculptures, and articles of *verité*, would have probably been indifferent to a vase or cup—the ordinary kind of testimonial—except as a mark of the good feeling of his neighbours. The committee, therefore, decided upon having a suitable address, written on vellum, and beautifully illuminated, and to enclose it in covers of carved ebony, with massive mountings of oxidised silver and gold, in the style of the fifteenth century: the Northwick arms occupy the centre, surrounded by emblems of painting, sculpture, &c.; the large medallions being enriched, in relief, with medallion portraits of some of the most distinguished ancient artists—Cimabue, Raffaele, Michael Angelo, Cellini, &c. The address was written and illuminated by Mr. C. Shaw, the eminent mediæval decorator; and the execution of the covers and the silver-work, were entrusted to Messrs. Martin, Baskett, and Martin, extensive silversmiths in Cheltenham, whose taste and skill in this matter are highly creditable. The address, containing upwards of seven hundred signatures, headed by the names of Earl Fitzhardinge and Lord De Saumarez, was presented to Lord Northwick by a numerous deputation of the inhabitants. It would be unfair to omit from this notice the name of Mr. E. Williams, an artist residing at Cheltenham, whose portraits are not unknown at the Royal Academy Exhibitions; he took great interest in the "getting up" of the testimonial, to which his taste and artistic knowledge lent considerable aid.

LIVERPOOL.—At a recent Special Meeting of the Liverpool Architectural and Archaeological Society, it was unanimously resolved, "after due consideration of the correspondence printed by order of the House of Commons, on the subject of the difference between Sir Charles Barry, R.A., and the Government, as to the rate of remuneration for that gentle-

man's services as architect of the New Palace at Westminster; this Meeting is of opinion that the grounds upon which is based the refusal of the rate of payment, established by long custom, of 5 per cent., are altogether untenable." The resolution proceeds to state the reasons for the opinion held by the members of this Association, which are too long for us to quote, and calls the attention of the Royal Institute of British Architects, as the chartered representatives of the profession generally, to the subject, with a request that they will take such steps as may seem to them advisable to assert and maintain the due claims of the profession.

A memorial of the late Archdeacon Brooks is about to be placed in St. George's Hall, Liverpool: it is to consist of a statue of the Archdeacon, habited in his clerical robes. A sum of upwards of £1800 has been collected by voluntary subscription to defray the cost of the work, which will be executed by M. B. E. Spence, an English sculptor resident in Rome, some of whose productions have been engraved in the *Art-Journal*. Mr. Spence was the successful competitor out of several sculptors who sent in designs.

PAISLEY.—On the 28th of June the annual meeting for the inspection of the works of the students in the Paisley School of Art, and for the distribution of awards, took place. The meeting was held earlier in the year than has been customary, in consequence of the alterations recently made in the arrangements of the department of Art in London, among which is the plan now adopted of sending an inspector to the various provincial schools to examine the works of the pupils and award the prizes; and it is his duty to see that the drawings, &c., which have gained for their authors these marks of merit are sent off to London. The Paisley School, during the past year, numbered 156 pupils, of whom 72 were new ones. Sixty drawings and paintings, the work of twenty-four students, were exhibited at this and a previous meeting in November last, and to twenty-four works out of this number of sixty, medals were awarded. The school appears by the Report to be in a satisfactory state. We see that the directors have in some instances awarded as prizes volumes of the *Art-Journal*: we may, perhaps, be permitted to say without being accused of egotism or presumption, that the varied information on all matters of Art offered in our pages renders it a book of peculiar value to the student, whatever branch of Art he may practise, whether appertaining to the Fine Arts or the Industrial.

EDINBURGH.—A statue of the late Professor Wilson is about to be erected in this city: Mr. Steel is the sculptor to whom the work has been entrusted; his model for the cast is, we hear, in a very forward state.

The prizes for the competition drawings, paintings, and models of the students attending the School of Design, under the auspices of the Board of Manufactures, were distributed at the National Gallery, in Edinburgh, on the 7th of July. Lord Murray occupied the chair, and distributed the prizes. Mr. A. Christie read the report on the department of architecture and ornament, which stated that the number of students who attended the classes in this department during the session was 411, and the number during the previous session 314; showing an increase of 97. Among the students were—painters, 14; sculptors, 3; architects and engineers, 30; draughtsmen, 4; engravers, 6; house-painters, 8; ornamental painters, 10; general engravers, 10; ornamental engravers, 3; wood carvers, 16; glass stainers, 6; brassfounders, 3; joiners and cabinet-makers, 7; marble cutters and stone-carvers, 3; mechanical engineers, 3; pupil teachers, 37; schoolmasters, 3:—total attendance on the male classes, 231. In the female classes there were—amateurs, 87; schoolmistresses, 20; and pupil teachers, 73:—total female pupils, 180. The class for practical architecture had suffered from the severe illness of Mr. Christie during the winter, and the drawings were therefore few in number; but during the vacation the students in this class had executed a number of drawings, which Mr. Bryce examined. The report adverted to the want of accommodation in the present rooms. During the session the number of students in these departments had amounted to ninety. In the antique, the progress of many of them had been very gratifying, and in general was very good.

RICHMOND.—An Art-exhibition was opened here on the 15th of July, under the patronage of the Duchesses of Gloucester and Cambridge. Pictures, bronzes, porcelain, and other works of Art, are among the numerous works contributed by the inhabitants of this locality,—one of the most picturesque in the vicinity of the metropolis, and a favourite resort of numerous wealthy and aristocratic families. The charge for admission is sufficiently moderate to allow the humbler classes to visit the exhibition.

THE CRYSTAL PALACE, AS A TEACHER OF ART AND ART-MANUFACTURE.

PART II.

WE rejoice to know that, under a more liberal and enlightened administration, such arrangements have been made to meet the requirements of Art-Manufacture as cannot be other than satisfactory; as yet, however, results are not sufficiently manifest in the Art-Courts, or in passages that lead to them, where several valuable exhibitors "show" their goods. We repeat our conviction, that so desirable an opportunity for the exhibition of improvements has never been offered to the producer; every advantage he can require is here placed at his disposal—ample space, good light, and his own arrangements for display; while visitors of all orders and classes, from the very highest to the comparatively humble, are continually present by thousands to ascertain their wants, and to study the best sources from which they may be supplied. These are gains of no little moment; and we cannot doubt their being appreciated by those who will give the subject consideration. But it is quite certain that to achieve the great object of rendering the Crystal Palace usefully available in this respect, the public must be induced to resort to it for the purpose; which can be done only by activity among the manufacturers, who *must*, if they desire advancement in this quarter, furnish with proper "samples" the Courts dedicated to their several Arts. By a judicious arrangement the Directors, although they require that a distinction be made between

works for exhibition and works for sale—placing the former in the Courts and the latter in the Galleries—willingly accord the aid in their power for giving publicity to *all* the productions of the exhibitor; and there is no difficulty in the way of making known, that he who labours for reputation in one place strives for remuneration in another. We desire to see the principle more entirely carried out, and we have no doubt it will be so when "good things" are supplied more abundantly: we hope ultimately to see in the Art-Courts only what is really excellent, and to be referred to the bazaar galleries for productions of the ordinary character of trade. At present there is a mixture, both above and below, which is to be regretted; many productions of merit being in the former, while in the latter we find a supply of articles that bear but little, if any, relation to Art.

THE SHEFFIELD COURT, to which we now direct the attention of our readers, may be described as full, or nearly so; but while of works in steel there is a very ample contribution—and it is such as largely sustains its "world-wide repute" in its staple trade—there is but one contributor of that for which the town has been also long celebrated; so closely indeed have PLATED GOODS been associated with Sheffield, as to have very generally obtained distinction as "Sheffield ware." We naturally look into this Court, therefore, to know who are its various producers, what their relative merits, what their several classes, and to whom a purchaser is to apply for that which he requires. In illustrating this branch of our subject, we are limited to the works of Messrs. JAMES DIXON and SONS—a firm long established and of

admitted supremacy, it is true, but by no means the only one in Sheffield by which works of excellence might have been contributed. This want of fair rivalry—of wholesome competition—is therefore to be deplored. But we may expect that, ere long, the evil will cease to exist; indeed, we have reason to believe that at the present moment arrangements are making in Sheffield by which this important branch of its commerce will be adequately represented, and that a competent agent has been engaged, to whom the charge of its interests will be intrusted.

The supremacy which Sheffield has maintained for nearly a century, has been of late years sustained and advanced by a system of plating goods on nickel silver (still continuing the fire-plating process), and mounting such articles with silver—by this mode a far better and much more lasting article is produced; for time effects no mischievous results by wearing away the coating, and making the copper appear; indeed, for all purposes of use, and even elegance, the object thus supplied has all the value—except the intrinsic value—of the pure metal. It is to this important feature of their produce that Messrs. Dixon require us to direct special attention, and which demands consideration on the part of all who examine the large cases of "goods" so prominent in the Court, and which contain varied and numerous specimens of the manifold productions of their extensive factory; this fact will be therefore borne in mind while reading the observations we shall presently offer. It may be well, however, here to state that a hundred years have passed since the art of plating on copper by the "fire process" was discovered. An ingot of copper and silver are united

THE SHEFFIELD COURT, CRYSTAL PALACE.

in a red-hot furnace, and adhere so firmly that they become as one metal; and to whatever length this is "rolled" the metals continue united. Recently the house of James Dixon and Sons have adopted this mode of plating on nickel silver, and, as we have said, mounting the ornamental part with silver. The foundation of the plate being harder and whiter, this description of "Sheffield-plate" consequently becomes superior to that for which Sheffield has been so long celebrated.

THE SHEFFIELD COURT is one of a range of courts on the south side of the Palace; it is sur-

rounded by small glass cases, which contain examples chiefly of cutlery; in the centre is an ottoman decorated with specimens of a more refined order, while at either side are the large cases of the manufacturers under notice: various "tools," principally contributed by the world-famous firm of TURTON, are scattered (but with due regard to order) about; but excepting knives and razors, the goods thus exposed have not been much subjected to the influence of Art; it is likely, however, that in the course of these papers we may be called upon to engrave and to describe some of these objects upon

which more than ordinary care has been exercised, and which have been, as far as they can be, made ornamental as well as useful.

Surmounting the ottoman which occupies the centre of the hall (and on which is about to be placed a statue emblematic of the town) are arranged some very fine specimens of manufactured steel—richly engraved and ornamented razors of Messrs. Nowill and Sons, skates of Messrs. Marsdon Brothers, and scissors of Messrs. Thomas Wilkinson and Son. As we have intimated, in the cases around the walls are varieties of goods—the famous

fabrie of the great capital of the manufacture; the more prominent are—a case containing at least a hundred different patterns of razors, the works of Stephen Martiu; knives of as many different kinds, steel and plated, the contributions of John Walters and Co. Almost as numerous is the collection of Unwin and Rodgers. The case of Wilkinson and Son is full of very beautiful examples of scissors of many and varied forms—those which manifest design, and are exceedingly elegant, and those which are for common use. Three of these we introduce on this page. The steel and plated knives and spoons of Messrs. Parkin and Marshall will attract and deserve notice; while the case of needles of Messrs. Cocker and Sons demands especial attention, as exhibiting the process, from the raw bar to the finished article with the gold eye.

The two cases of Messrs. Dixon, which range at either side of the ottoman, contain a large number of examples of the produce of their justly-celebrated factory in Sheffield—an establishment with ample resources, so extensive, indeed, as to give employment to more than six hundred persons, and producing a considerable amount of those results which find their way not only throughout England, but into every part of the world. In the one case is the “plated ware,” and in the other is “the Britannia-metal ware”—a ware that has acquired universal fame for its usefulness in “constant service,” which is manufactured in every possible variety of form and shape, and applicable to almost every conceivable

purpose of domestic requirement. From the very abundant objects supplied to us by these two cases we select but four objects—a tray of remarkably good design, and engraved skilfully and gracefully;

examples of Art-manufacture; and, as a collection, it undoubtedly manifests great advance—an advance fully keeping pace with that improved taste, that desire (so general as to be almost universal) for the judicious combination of elegance with utility which is becoming more and more a leading characteristic of the manufactory and the workshop in all our productive cities and towns.

Still, as we have stated, Sheffield is not sufficiently represented—its stores of wealth are barely indicated here. Before these papers are finished it is probable, therefore, we shall return to this branch of our subject; for we believe arrangements are in progress for more adequately and justly exhibiting to the world the numerous productions of this renowned capital of wrought-iron produce.

The trade of Sheffield to all parts of the world is immense; its reputation for articles of steel dates back to a very remote period: Chaucer celebrates the “Sheffield whittle,” and long before his time, when Sheffield was “near Rotherham,” and the serfs gathered about the castle of their liege lords the Talbots, “great Earls of Shrewsbury,” the knives of their production were famous throughout the land. As we have said, however, it is little more than a century ago since it was discovered how nearly plated goods could be made to represent silver; hence has grown a commerce which gives employment to tens of thousands, and has made “Sheffield” almost as well known as London “the world through.”

a tea-urn of excellent and convenient form; a soup-tureen of admirable proportions; and a side-dish of exceeding elegance. Among those we have passed over will, however, be found many most desirable

THE PLATED WARE OF MESSRS. DIXON AND SONS.

Hence, we again pass to THE CERAMIC COURT, which, now near its completion, more than realises the anticipations formed of its success, and worthily ranks amongst the most valuable and attractive features of the Crystal Palace. Sufficient works have been received to fill the spaces allotted to their reception; the greater portion of them are arranged, and the whole plan, now fully developed, assumes a character of the highest importance and utility.

Such a collection, submitted to public inspection, cannot fail to be largely influential in stimulating our manufacturers to still advancing efforts in a branch which has of late years made such considerable progress; and we learn from Mr. Battam, with

much gratification, that the collectors, who have so generously favoured him with loans of specimens, have also further extended the value of their co-operation, by permitting sketches to be made for illustration of the most remarkable and valuable works, thus affording an additional means of publicity, tending to facilitate the realisation of the advantages we predict from their study. The exhibition will also foster and extend among the general public a due appreciation of the capabilities and resources of a manufacture, which includes within its range the production of works of such varied beauty.

The Ceramic Court is divided into two compartments, which are thus appropriated:—the inner one,

which fronts the terrace side of the building, is devoted to a classified arrangement of plastic art, from its earliest operations to the present time, and abounds in illustrations of great interest. The pottery and stone ware includes examples of the early Roman, of the vases of Etruria, the enamelled fabrics of Lucca della Robbia, amongst which one with a Virgin and Child, encircled with a garland of fruit and flowers, is an extremely fine specimen, as also a Negro Boy, life-size, the face being most truthful and expressive. Proceeding on, we come to a remarkably important collection of majolica ware, chiefly lent by ISAAC FALCKE, Esq., from his private collection; and these examples testify to considerable judgment

on the part of the collector, for they are of very high merit and value. We have in this series illustrations of the earliest productions, in which the Moorish type is strongly evident, together with the wares of Pessaro, with their various metallic lustres, those of Castel Durante, Gubbio, Urbino, Faenza, &c. &c., including authenticated examples by Geronimo, Andreole, Giorgio (who invented the ruby-gold lustre in 1525), Orazio Fontana, &c. &c.

Of the stone ware of the Rhine (sixteenth century) there are many interesting specimens. The celebrated Jacqueline of Holland, after her abdication, in 1433, retired to the Castle of Peylingen, near Leyden, and there gave her personal superintendence to the advancement of this manufacture. The result of the trials and labours of the immortal Bernard Palissy, also find registration in some important examples,—the inspection of which naturally and forcibly awakens the recollection of that indomitable energy and perseverance, which, amidst scenes that would have crushed any ordinary spirit, sustained this "glorious potter" to a protracted though final success, which has lent an imperishable lustre to his name and country.

Other examples of manufacture of less importance, but necessary to the completion of an historical collection, bring us to the pottery of our own time and country.

The porcelain commences with examples of the Chinese, with whom it appears, according to M. Stanislas Julien, it was common in the time of the Emperor Han, B.C. 163. Amongst the specimens are three magnificent vases, upwards of five feet in height, a pair of large cisterns, and a variety of miscellaneous articles; also specimens of the porcelain of St. Cloud—Böttcher's Saxon porcelain leading successively to the marvellous productions of the best periods of Dresden, Sèvres, Berlin, Vienna, &c. &c. The early English of Chelsea, Derby, Worcester, Bow, &c. &c., is also well represented.

The collection of Dresden manufacture is of very considerable extent and beauty, including the variety of styles for which that royal establishment has been so long famous. In painting and gilding there are many remarkably fine examples of the early oriental patterns, of the pastoral vignettes, and subjects historical and mythological. The figure-painting of the Marcolini period is extraordinarily fine, and fully

warrants the estimation in which the works of that time are specially held. The porcelain figures and groups of the same

manufacture are represented in some number, and of considerable size. A most important work is the group of

"Apollo and the Muses on Mount Parnassus," the base of which is three feet long, and the subject nearly three feet high. It is a fine example of the style, and of great value—lent by Mr. DAVID FALCKE, of 92, New Bond Street, who has also contributed some very beautiful examples of the various decorations applied to the highest class of the foreign manufactures.

This portion of the collection has been considerably enriched by a very liberal loan from HENRY PORTER, Esq., of Wenslade, who possesses, amongst a large and valuable miscellaneous collection, some singularly fine specimens of old Dresden ware, purchased during a lengthened residence in that city, where his family occupied the Marcolini Palace, in which the finest examples of the manufacture, executed while under the directorship of the Count Marcolini, were deposited. Amongst these is a group of large dimensions, representing a Temple of Bacchus, with groups of Bacchus and Ariadne, and fawns dancing, &c. The modelling is of rare excellence, and makes us regret the glazed surface, which so materially detracts from the sharpness of the work, and causes a flicker that destroys the effect of the light and shade. This group was used as a plateau upon the banquet tables of the electors of Saxony.

A pair of pheasants, life-size, from the same collection, is also remarkable for the fidelity and spirit of the modelling, and the success with which the difficulties of their manufacture have been overcome. These birds, together with another pair, also in the possession of Mr. Porter, formed prominent objects in the state rooms of the Marcolini Palace, at the time it became the residence of Napoleon I. at the siege of Dresden.

In examples of Sèvres porcelain the Court is singularly rich. We referred, in our last number, to the magnificent specimens of the painted and jewelled ware, together with the exquisite portraiture embellishing so many of the beautiful and costly works lent by General the Hon. Edward Lygon. To these is now added a very important addition from the collection of Mr. David Falcke; and first in importance of these examples are the exquisite specimens of the service of *pâte-tendre*, made by the express order of Louis XVI., and exhibited at the Christmas fête at Versailles, in 1783. A large portion of this service was bought by George IV., and is now in the possession of Her Majesty, at

THE VASES, ETC., OF MESSRS. MINTON AND CO., EXHIBITED BY PHILLIPS BROTHERS.

Windsor Castle. Each piece contains five medallions of historical and mythological subjects, painted

with a power, freedom, and, at the same time, finish of detail surpassing anything we have ever seen on

this material. Popon and Guet are the artists whose taste and skill have imparted so high and

permanent a value to these productions—a value not dependent upon the duration of a fashionable caprice, but resulting from the intrinsic excellence of the works themselves.

A number of vases, *déjeuner* trays, plates, cups and saucers, also of Sévres manufacture, furnish varied exemplifications of its perfection.

The specimens of Vienna are numerous and of high quality, the painting of some of the figure subjects successfully rivalling that of Sévres; whilst the gilding, both in colour, delicacy of manufacture, and the peculiar prominence with which it is raised upon the ware—presenting quite the appearance of a fine embossment—is altogether unique.

We can but note in our present number the examples of Berlin, Naples, Spain, Venice, St. Petersburg, &c. &c.—these we shall take a future opportunity of bringing under review.

We have much pleasure in stating that LADY ROLLE has kindly and liberally lent some valuable specimens from her important collection. Prominent amongst these is a pair of magnificent vases of the imperial manufacture of St. Petersburg, presented to Lady Rolle by the Grand Duchess. These vases are above three feet high, and of excellent manufacture; indeed, the painting of the landscapes, seaport views—one a sunset, and the other a moonlight scene—are wonderful examples of the art. We shall hereafter refer to other works generously deposited here by Lady Rolle.

The English examples present very fine specimens of Old Chelsea, Derby, Worcester, Bow, &c. &c.

The Ceramic Court also possesses one of the finest selections of the Wedgwood-Flaxman wares ever offered to public inspection. It numbers upwards of three hundred specimens, and is indeed so important, both retrospectively and prospectively, that we shall comment fully upon it in a future number. England may well be proud of what we must now regret to call *past successes*—successes we trust this exhibition will tend to revive and extend. One of the original fifty copies of the Portland Vase, together with a great variety of vases, candelabra, cameos mounted in jewel cases, watches, &c. &c., a service of terra-cotta, mounted in silver, formerly belonging to Queen Adelaide, are conspicuous objects. This series of the Wedgwood-Flaxman ware is kindly lent by Isaac Falcke, Esq. We purpose selecting some of the specimens for illustration. For our illustrations this month, we have selected only those of Messrs. MINTON & Co., of Stoke-upon-Trent. A very brief description of these articles will suffice. They contribute a number of large and important works in the style of the majolica, but adapted with such taste, and at the same time originality of treatment, as to give them quite a special character. The Minton-majolica is one of the most successful revivals of modern pottery; the spirit of the early works is evidenced in the reproductive style, and there is, both in the materials and manufacture, in the models, in their manipulation, and in their decoration, a very marked and acknowledged superiority. Some of the examples are of large dimensions, as eisterns, vases, &c. &c. These have been manufactured expressly by Messrs. Minton, and are *exhibited by them*. There are also a number of porcelain vases, several of which were included in the works that gained for Messrs. Minton and Co. the "*grande médaille d'honneur*" at the Paris Exhibition last year. We have selected some of these for illustration (*vide* page 255). The first in the group is of graceful form, the figures exceedingly well painted, and with a degree of boldness not usual in porcelain; the next vase is of the celadon-green, extremely beautiful in tint, with Alhambresque borders, well relieved in colours and gold; the Cupid Candlestick, in Parian and gold and turquoise, is a very tasteful design; the vase with medallions (one of the last works of this firm) is of exceeding beauty, the turquoise ground very brilliant,

and the general features of the design very happily rendered—the perforations introduced in the or-

namentation give a lightness to the work both novel and pleasing. The fourth vase is of Ra-

phaltesque character, arranged and coloured with great care.

These works are exhibited by Messrs. PHILLIPS,

the present proprietors of the London dépôt of the old Worcester Works in New Bond Street, formerly Messrs. Chamberlain's—the manufactory belonging now to Messrs. Kerr and Binns, to whose spirited exertions we have frequently had occasion to refer.

The other illustration on page 255, represents one of the most prominent pieces of the celebrated dessert-service produced for the Exhibition of 1851, and purchased by Her Majesty for presentation to the Emperor of Austria. This was the most costly and extensive work ever produced in England, and the quality of design, merit of the models, and technical talent displayed in the various manufacturing processes (of formidable difficulty in such a work), have rarely if ever been surpassed in modern Art. It is executed in Parian, in combination with porcelain, enamelled and gilt with great delicacy.

The tripod of Messrs. Minton, on this page, is placed in the centre of the outer court, and is a very beautiful and attractive feature, as well as a great triumph in the "potter's art." It is a duplicate of the work which created such a sensation at Paris last year. We should be gratified to hear that commissions were given for a production that entails so much credit, both as regards taste and enterprise, on the manufacturer. The two garden-seats, at either side of this tripod, are very beautifully decorated; and the smaller *jardinière* which heads the page, is of much grace and originality.

Many important works from the manufactory of Messrs. Minton & Co. are near completion, and will be deposited in due course. These will include a colossal vase, modelled by the Baron Marchetti expressly for that firm. The important collection from Mr. ALDERMAN COPELAND's manufactory shall have our attention in next number, when we shall engrave some of the most remarkable of his productions.

A large number of the best examples of Messrs. RIDGWAY, BATES, and Co., of the Staffordshire Potteries, have been arranged, but too late for our present notice; and we hope and believe that arrangements are making, by which all the leading potters of Great Britain may be fairly and adequately represented. Indeed, we shall consider that Mr. Battam's task is not complete until this great purpose has been accomplished—that of exhibiting Ceramic Art as it now exists in this country—by one or more examples of every meritorious producer.

In thus giving prominence to the many admirable works exhibited by Messrs. Minton, we do but justice to the high position which that firm occupies in the estimation, not only of England, but of Europe and America. Mr. Herbert Minton, an enlightened and liberal gentleman, has been indefatigable in his efforts to advance the Art of which he is a foremost representative.

Wherever talent was to be found, he sought it out and made it available; some of his principal artists are Frenchmen, and their employment must have given strong impetus to movements at "the potteries"—stirring up those energies which competition and wholesome rivalry always excite, and which are ever productive of public benefit. Mr. Herbert Minton may review his long career of success with justifiable pride; for while it has been honourable to him it has been beneficial to his country. He can remember when a good work produced in Staffordshire (always excepting the produce of Wedgwood) was rather the result of accident than of design. It is not so now; excellence begets excellence; to improve public taste in any branch of public requirement, is to advance a desire for improvement in all; the changes for the better which have taken place in the productions of the potteries—and which are patent to the world—are only parts of that general progress in Art-Manufacture which has, undoubtedly, of late years elevated the national character, and essentially promoted British commerce. Foremost in the list of men who must be—now and ever—regarded as public benefactors, will be the honoured name of HERBERT MINTON.

THE TURNER BEQUEST.

THE number of *pictures*, including those of "every kind," some of which are slight sketches, or merely "laid in," bequeathed to the nation by the late J. M. W. TURNER, R.A., and now national property, amounts to three hundred and sixty-two. The following is a list of ninety-eight of the principal works. Many of these are of high finish and of great value, but some of them are of comparatively little worth. How many of these will be eventually "hung" is, however, uncertain.

The remaining two hundred and seventy are, we presume, little better than canvases; but the collection of *pictures* is independent of the *drawings*, which are also very numerous—from mere sketches to finished works; these will probably go to the British Museum—at all events for the present. We trust at no very distant period, however, the productions of pure Art—the property of the nation—will be gathered into one collection.

When the "Turner Bequest" will be exhibited to the public is still uncertain; it is not, we believe, intended to be seen at the National Gallery: and will probably be kept apart until the building at Kensington Gore is ready for its reception. To show it in Trafalgar Square is out of the question. It would be difficult to estimate the value of this magnificent bequest; which may be accepted, however, as another proof how rapidly the national wealth in pictures would accumulate, if the nation really courted such acquisitions, and erected a building fit for their reception.

In consequence of the apathy that has prevailed, we have lost several rare and valuable collections, and it would seem as if the evil were likely to continue; for, in consequence of the recent decision of the House of Commons, we appear to be as far off as ever from a consummation of long cherished hopes.

The "Turner Bequest," and the "Vernon Gift," ought surely to convince the Government—and Parliament also—that "delays are dangerous." We could name several "collectors" who are awaiting a decision in this respect, to know whether the country is to be enriched, or the auctioneer employed.

THE GIOVANNI BELLINI.

THE following letter—addressed by Dr. Waagen to the *Times*—will, we imagine, entirely disabuse the public mind in reference to one of the national pictures. The letter had best be left, without note or comment, to speak for itself:—

"TO THE EDITOR OF THE TIMES.

"SIR,—I had hoped that a letter signed 'William Coningham,' regarding a Virgin and Child, by Giovanni Bellini, in the National Gallery, which was printed in the *Times* of last Friday, the 11th, would before now have been replied to by one of the numerous English gentlemen known to possess a true knowledge as well as love of Art. To my surprise, no such reply has appeared, and I therefore feel myself justified in requesting a place in your columns, which I should not otherwise have assumed. It is possible that those gentlemen may have considered any refutation of Mr. Coningham's letter as unnecessary; and, were the general public as enlightened on these subjects as they, I should entirely concur in their silence; but this is not the case. The inordinate presumption, therefore, which asserts this Virgin and Child by Giovanni Bellini to be 'spurious and vamped up,' of the lowest type of Art, 'extensively daubed over and repainted,' 'for educational purposes utterly worthless,' &c., without taking the trouble of giving a single proof of the truth of such assertions, is, unfortunately, but too well adapted to mislead; for it is natural to believe that a writer who assumes such a tone of condemnation must be very sure of the correctness of what he advances. Under these circumstances, and considering the deep interest I have for many years taken in all matters concerning Art in England, and the confidence which many in this country are pleased to place in me, I feel it my duty towards those who love Art, as distinguished from those who may be supposed to have a knowledge of it, to point out somewhat in detail the untruthful and untenable nature of Mr. Coningham's statements.

"I am acquainted with most of Giovanni Bellini's works, in Italy, France, England, and Germany, and, setting the indubitable signature on this picture in the National Gallery entirely aside, I know of no Madonna and Child by him which, as regards the question of genuineness, more decidedly bears the stamp of his hand. At the same time, in intensity of religious feeling, regular beauty of the heads, masterly rendering of every portion, and deep and full harmony of colour—in short, in all that most constitutes the merit of a picture, it surpasses every other example of this subject by the master I have hitherto seen. The mother and the divine infant are both holding the apple—the symbol of the fall; and in the expression of elevated and resigned sorrow which pervades the heads, the painter has intended to depict the pathetic consciousness of the Saviour's stupendous mission. The heads and hands of each, and the body of the child, are modelled with a plastic power and roundness which bear witness to the painter's having devoted all his energies to the task; while the warm brownish tones of the flesh, the dark but luminous colouring of the red and blue draperies, and of the green curtain, are in deep and earnest harmony with the solemn import of the subject.

"Further, as regards the preservation of the picture, I have met with few specimens of the old masters which can be said to be so faultless in this respect. Seldom, indeed, is the original surface—shown in the draperies commonly by a ridgy inequality, and in the flesh parts (in the masters of the fifteenth century who painted in oil) by a fused and enamel-like smoothness—seen in such a perfect state of preservation as in this picture. To any one the least versed in such matters the mere idea of overpainting is in this case simply ridiculous; and it must be owned that Mr. Coningham has showed no common degree of boldness in challenging the public to support him in such a declaration.

"For the reasons above stated, therefore, I am at a loss to discover any better grounds than ignorance or malice for all Mr. Coningham has advanced in his letter. Here the proverb, '*Ex ungue leonem*,' may be justly quoted, for to these sources may be traced every article regarding the National Gallery

with which Mr. Coningham and his in every respect worthy coadjutor, Mr. Morris Moore, have for a number of years favoured the public. It is true that in these same articles I have also had a large share of abuse; and, though I have always felt it as unnecessary for me as it would be unworthy to descend into the arena which these gentlemen occupy, yet, before concluding this letter, I may add that I am proud of having been the first to introduce that system of chronological arrangement of pictures which characterises the Berlin Museum. The utility of this plan has gained me the approval of some of the worthiest and most distinguished men of Europe, and has further been evidenced by its adoption in the largest European collections—namely, in the picture gallery of the Louvre, and in the sculpture department of the British Museum. Under these circumstances I can afford to be utterly indifferent to the censure of such a critic as Mr. William Coningham.

"I am, Sir, your obedient servant,

"GUSTAV WAAGEN."

"*Athenæum*, July 14."

Mr. Coningham has attempted a reply to this letter, in which, after speaking of the "insolence" of Dr. Waagen, he seems content to let the public judge by whose "authority" they will be guided: and the public will so judge. Dr. Waagen is known all over Europe as a gentleman of the noblest honour; his integrity has never been questioned; his judgment, based on large and long experience, is admitted in all the galleries of the Continent, and by all the learned in Art, as a guide as unerring, at least, as that of any living connoisseur; his published works are open to all. In this contest, therefore, the combatants do not enter the arena on equal terms.

ART IN CONTINENTAL STATES.

PARIS.—M. Yvon has been commissioned by government to paint a picture of the "Capture of the Malakoff" on a large scale. The artist has just returned from the Crimea with a portfolio of studies and sketches, in the execution of which he has passed the last six weeks. It is also said that Couture has received an order to paint the "Baptism of the young Prince Napoleon," and that the sum of 80,000 francs is allowed for that purpose.—The editor of the *Revue des Deux Mondes* has been condemned in 200 francs, and M. Gustave Planche in 300 francs and expenses, for having severely criticised a portrait of the Queen of Spain, by M. Madrazzo, the celebrated Spanish painter. This painting was represented as in the Grand Exhibition, which was not the case; hence the judgment, founded on the opinion that the remarks passed the fair bounds of criticism.* M. Gustave Planche is celebrated as a severe cynic, and has not in this affair found much sympathy among the artists of Paris.—The embellishments round the *Arc de Triomphe* are being executed on a large and magnificent scale; the various architectural monuments, façades of hotels, statues, &c., will make this entry to Paris more like a fairy-scene than a reality. The improvements and decorations in the *Bois de Boulogne* will also add greatly to its attractive features.—The objects of Fine Art taken at Sebastopol have arrived in Paris; they consist of two sphinxes and a pediment, and have been placed in the *Orangerie* of the Tuileries.—A monumental column is about to be erected in commemoration of the campaign of the Crimea.—The *Salle du Trône*, at the *Hotel de Ville*, was decorated, for the first time, on the day of the baptism of the young prince, with an equestrian portrait by Horace Vernet. Medals, to the number of 120,000, commemorating the baptism have been distributed to all children in the colleges and schools, to the national guard, &c.—Although the season this year is not as yet in favour of the landscape-painters, the ateliers of Paris are nearly deserted, as is usual in the summer time, when all those who have it in their power are roaming the woods, forests, sea-shore, mountains, and meadows in search of subjects and health; there will be no *Salon* this year, we therefore look forward to grand doings next season.

* We think our correspondent is wrong here in his inference. The fact upon which the verdict was given, from the report of the trial as copied into the English papers, was, that the picture in question was actually not painted, but only in progress, and, therefore, that an unfinished work ought not to have been subjected to such strictures as the critic thought proper to pass upon it. The mere statement of a picture being where it was not, could never effect the reputation of the painter, and, therefore, would not entitle him to recover damages.—ED. A.-J.

MINOR TOPICS OF THE MONTH.

THE MEMORIAL OF THE GREAT EXHIBITION.—It will be in the recollection of our readers that, not long after the close of the Exhibition of 1851, the then Lord Mayor of London (Alderman Challis, M.P.) called a meeting at the Mansion House, the object of which was to raise by subscription a sum of money, in order to place in Hyde Park a work in sculpture, by which the memory of that great event might be worthily perpetuated. The project was hailed with enthusiasm—for the subject was still warm—but it received a check from the public press, and was not encouraged by Prince Albert, mainly because it was announced that a statue of His Royal Highness would be a leading feature of the contemplated work. Notwithstanding, a sum amounting to between £5000 to £6000 was subscribed and paid, and a further contribution "promised" but not paid, on the ground that the proposal was not to be carried out in its integrity. We believe the Prince, on being consulted, advised that the money should be distributed among societies for the encouragement of Art and letters. This suggestion did not meet the views of the Committee and the subscribers, and consequently all proceedings were suspended. The money is, however, still in the hands of Alderman Challis; he has added the interest to it, and we believe it now amounts to £5600. That gentleman is anxious to know what course he had best pursue; he desires to rid himself of responsibility, and yet not to relinquish the trust reposed in him until he can do so with honour, and with due regard to the wishes and intentions of the subscribers. Three or four meetings have been held with this view, and it was a general impression that, however desirable it would be to defer to any feeling of His Royal Highness, it was not in the power of the Committee to expend the money subscribed in any way, other than that declared at the time the subscription was entered into. Arrangements are, therefore, in progress for carrying out this project in its integrity—by inviting designs (or models) from sculptors—not confining the invitation to British artists; and meanwhile, Dr. Booth, of the Society of Arts, and Mr. George Godwin, have consented to act as Hon. Secs., a sub-committee having been appointed to co-operate with them. At present we can give no further information; but it is probable that ere long we shall be in a condition to do so. It seems a desire to place the intended sculptured record of the Great Exhibition in Hyde Park, on the spot where the memorable Palace stood in 1851; but to this there may be objections in high quarters—to us it does not seem a necessity; it will, we think, answer equally well as "a memorial" if it be made to occupy a centre of one of the squares which will be formed at Kensington Gore. This arrangement will probably not be distasteful to His Royal Highness, especially if the original plan be so far modified as to lessen that prominence of portraiture which was the chief ground of his objection. At all events, we believe that at length there will actually exist a lasting memorial of the Great Exhibition. We hope and trust it may be one that will be worthy the event it commemorates, and honourable to the nation.

THE COLLECTION OF M. SOULAGES OF TOULOUSE.—This renowned collection—which consists of a large number of works of high interest and marvellous beauty, chiefly of mediæval furniture and objects of *vertù*—is at this moment the subject of an arrangement, which is more than likely to secure it for England; to be added probably to the stores now at Marlborough House. It has been valued at £11,700; and at that price it is to be purchased by several noblemen and gentlemen who have subscribed sums for the purpose, varying from £1000 to £100. The purchase is to be effected, however, only to prevent the collection from being taken elsewhere; it will be in due course offered to Government, and, if declined, will be sold in some other way; or, if necessary, it will be submitted to public auction, and so be dispersed. We trust that no spirit of mistaken economy will prevent the Government from purchasing this rare, interesting, and most instructive collection. Parliament will, we are sure, grant the sum required—and it will be a wise grant; such acquisitions *pay* in the highest sense. They are teachers who are continually giving value for

what they cost. Under existing circumstances, when our manufacturers and artisans are advancing in every branch of Art-Manufacture, it is most essential that the country should lose no occasion of coming to their aid, or to manifest care of, and interest in, their progress. The collection will be publicly exhibited, and "public opinion obtained on its merits, before the Government is asked to purchase it for the nation."

STATUE OF THE LATE DUKE OF SUSSEX.—It is a rare occurrence in our time to find a sculptor in a position—even when he has the desire, which we know many have—to be liberal; that is, to give, rather than sell, what has cost him much thought, labour, time, and some amount of money to produce. Mr. John Thomas, the sculptor principally employed in the new Houses of Parliament, has, however, made a gift to the Royal Free Hospital, in the Gray's-Inn Road, which is most honourable to his good feelings and to his skill as a sculptor. The presentation is nothing less than a life-size statue of the late Duke of Sussex, in his robes as a Knight of the Garter; the work is a fine, bold example of portrait sculpture; and there is a peculiar appropriateness in the gift, as the duke always took a warm interest in the success of the institution where the statue is now located. The Committee of the hospital unanimously passed the following resolution immediately after the inauguration of the work:—"That the warmest thanks of the Committee of the Royal Free Hospital be, and are hereby presented to John Thomas, Esq., for his most valuable and gratuitous modelling and superintending the execution of the statue of his late Royal Highness the Duke of Sussex, recently placed in front of the Sussex wing of this Hospital. And that the Committee hereby record their high sense of Mr. Thomas's great generosity in giving his distinguished services to the Hospital on this occasion, and also of the admirable likeness and consummate work of Art with which his genius has adorned and imparted an additional interest to this charitable institution."

THE NATIONAL GALLERY.—A document has just been printed by order of the House of Lords, of the pictures in the National Gallery which have been exhibited, but do not now form part of such exhibition. There are two pictures—"Leda," by P. F. Mola, and "Serena rescued by the Red Cross Knight Sir Calypso," by W. Hilton, R.A.—which do not now form part of the exhibition. Both the pictures are damaged. The number of pictures bequeathed, or given, to the nation which are not exhibited in the National Gallery, is 34.

A COLOSSAL BUST OF HER MAJESTY THE QUEEN has been executed in marble by Mr. Noble, for Robert Barnes, Esq., the late Mayor of Manchester, by whom it is designed to be presented to the Corporation, in order that it may be placed in the Town-Hall of the city. It is a work of considerable merit, and is, we understand, highly satisfactory to Her Majesty, who gave to the sculptor several sittings.

THE PICTURE GALLERY AT THE CRYSTAL PALACE.—The Directors have acted wisely in wedding this collection; a still bolder hand is required; but it is certain that a very material change for the better has been wrought; and the gallery may now be described as a most agreeable and useful addition to the many attractions provided at the Crystal Palace. There is a large number of interesting and beautiful pictures of the several schools of Europe; an hour may be very profitably spent here, and we have no doubt in course of time it will vie with the best exhibitions of the metropolis. We entreat the Directors, however, to remove an evil of so glaring a character that its existence is a marvel: slips of printed paper, containing the name of the picture and that of the artist (very desirable adjuncts in their way), are pasted on so coarsely and clumsily as to create absolute disgust; continually, they deface the frame—but that is of comparatively small moment: frequently these pieces of yellow paper—sometimes as large as six inches by two—are pasted *on the painting*, or, in cases of drawings, on the glass. This is quite intolerable—it is an insult to the artist, for it destroys the value of his work: it is evidence, moreover, of careless and slovenly habits on the part of those who have the care of the gallery, and leads very naturally to a conviction that the charge of good works has not been committed to good hands.

THE PEACE TROPHY of Baron Marochetti, at the Crystal Palace, has been for some weeks undergoing "alterations and improvements," which had better be let alone: the thing is a failure—has been discreditable to the Directors—they know it—the wisest course would be its removal; so long as it remains it will be a perpetual reproach, which all the gold and silver and bronze they can put upon it will not lessen; if it were good it would be out of place, for it entirely destroys the fine view of the structure obtained before this monstrosity was there; as it is, it is injurious to the Company: for those of their visitors who do not grieve, laugh.

DEPARTMENT OF SCIENCE AND ART.—It is announced that in the spring of 1858, an Exhibition of Works of Ornamental Art will take place under the auspices of the Department of Science and Art; its main feature will be "an Exhibition of those Works of Ornamental Art, produced since the establishment of the Schools of Art, as articles of commerce, which, either in their original design, or in their entire or partial execution, have been carried out by those who have derived instruction from the Schools of Art." The works to consist of Carvings in all materials, Furniture, Decorations, Metal Working of all kinds, Jewellery and Goldsmiths' Work, Pottery, Glass, and all kinds of Decorative Woven Fabrics. The object of this early announcement is, "that the public may have an opportunity of performing their part by giving liberal Commissions to Manufacturers and others to produce useful works, which, exhibited on this occasion, will be calculated to show fully and fairly the influence which the Schools of Art are exercising in the country."

A NATIONAL GALLERY OF ENGRAVINGS.—A suggestion has recently been thrown out in the *Builder* which is too good to be lost sight of, and which we should rejoice to see carried into effect. The "print-room" of the British Museum contains a large and valuable mass of engravings of all kinds, and of all countries, from the earliest period of the art to our own times: these are known to, and have been seen by, only the comparatively few individuals who take especial interest in such matters; the public at large are almost entirely ignorant of their existence. But why should not they be acquainted with them? nay, why not exhibit prints as well as pictures, either in our new National Gallery when erected, or elsewhere, as may be considered advisable? Such is the hint offered by our contemporary. The writer says, "Some years since it was proposed, we believe by Mr. W. Carpenter, the present obliging keeper of the prints, to erect a gallery for their exhibition to the public. The plan was submitted to the late Sir Robert Peel, and much approved by him; and the long apartment which now contains the Nineveh Marbles was originally intended for that purpose." The untimely death of the statesman, however, put an end to a scheme which would otherwise, in all probability, have been carried into effect. Although a considerable number of the prints are bound up in volumes, for their better preservation it is presumed, still there must be hundreds that, framed and glazed, and hung up, would convey a large amount of Art-instruction to the people, and form an exhibition of no ordinary interest and importance. We trust the subject will have the attention of all who can aid in carrying the project into effect; for what use is there in hoarding up treasures that profit not one in ten thousand of our population, and for which the public money has been liberally expended?—liberally, that is, in proportion to the sums paid by the nation for works of Art.

MR. GEORGE GWILT, F.S.A.—We extract from our contemporary, the *Builder*, the following notice of this gentleman, whose death took place on the 26th of June, at his residence in Southwark:—"Mr. Gwilt was the elder of two sons of Mr. George Gwilt, an architect and surveyor, also of St. Saviour's, Southwark, where his family have resided more than a century; the younger son being Mr. Joseph Gwilt, the well-known author of 'The Encyclopedia of Architecture,' and other important works. Mr. Gwilt, sen., was surveyor for the county of Surrey; and, amongst other buildings, he erected Horsemonger-Lane Gaol and Newington Sessions-House. He died on the 9th of December, 1807. His son George was born on the 8th of May, 1775, and he was consequently in his 82nd year at the time of his

death. He was brought up to his father's profession of an architect, and succeeded his father in his professional practice on his death. His chief work, and that with which his name will always be worthily associated, was the restoration of the choir and tower of St. Mary Overy's Church, and the Lady Chapel, which Mr. Gwilt executed with much taste and judgment; though as regards the choir and tower, at a very great expense to the parishioners of St. Saviour, who, although proud of their fine church, were not well pleased to have incurred a debt of £35,000 for the restoration of a part of it. This work was performed between 1822 and 1825. With Mr. Gwilt such works were labours in which he delighted, and when, through the indefatigable exertions of the late Mr. Thomas Saunders, F.S.A., the Lady Chapel was rescued from destruction, and its restoration effected by means of a public subscription, exceeding £3000, Mr. Gwilt liberally undertook the professional direction and superintendence of the work, and performed it gratuitously."

ELECTRO PLATE MARKERS.—We may be rendering a service to some of our lady readers—and we know there are many—by directing their attention to the Patent Electro Silver Plates for marking linen, &c., manufactured by Mr. Culleton, whose advertisement appears in our columns. These plates will serve other purposes than that for which they are more especially designed—such as the insertion of the name in books, &c.; and when the crest is added to the name, the combination becomes ornamental. The application of the plate is so simple that any one can use it successfully.

THE LIONS FOR TRAFALGAR SQUARE.—Month after month—nay, year after year—goes by, and finds the Nelson Monument still incomplete. There must be gross dereliction of duty somewhere.

THE NIGHTINGALE BROOCH.—Mr. Waterhouse, Her Majesty's jeweller, of Dublin, has evinced his zeal in the cause of humanity and Florence Nightingale by producing a Commemoration Brooch, appropriate in design and elegant in execution, and has resolved to devote the proceeds of the sale of this highly-wrought jewel to "the Nightingale Fund." We record this act of liberality and devotion to a good cause with the more pleasure, because it proves how wide-spread is the interest excited by the heroism of this noble woman. The tablet represents a wounded soldier, to whom a female is administering relief; this is surrounded by a motto, which in its turn is enwreathed by a rich garland of laurel tied with a ribbon, and surmounted by a crown. The design is based on the jewel presented to Miss Nightingale by the Queen, but it is so altered as to suit the purpose of a brooch for ordinary wear. It is very beautiful, and does high credit to the eminent Dublin jeweller who has produced it.

ROYAL ACADEMY SCULPTURE.—In our notice last month we commended the statue of "A Boy Playing with Tali," but we wrongly attributed it to W. M. Thomas. It is the work of Mr. Charles B. Birch, a young sculptor of considerable talent, who has been for some years studying at Berlin, where he was the favourite pupil of Herr Wichmann. He has produced several admirable busts; and in this, his more ambitious work, he justifies the high hopes that have been formed of his future career in Art.

FORGED ANTIQUITIES.—The reports of the committee of inquiry on the authenticity of the Mero-vigian Cemetery, called "La Chapelle St. Eloi" (Departement de l'Eure), have lately been published by the members of the Society of Belles Lettres of that department, who formed it, and which consisted of the president, the Marquis Ernest de Blosseville, M. Colombel, the secretary, and seven of its principal constituents. After much patient investigation, they have come to the unanimous conclusion, that the discovery is a well-arranged trick, and the objects pretended to be found are clever forgeries. The discovery was made known to the world by M. Charles Lenormant, of Paris, whose position is that of a leading official in the national collection there; and his elaborate detail of the whole *trouaille* unquestionably affects his reputation as an antiquary. The attempt to induce the French government to purchase these forgeries as precious historic data, contradicting, as they did, other and genuine monuments, is a grave offence. The pertinacity of M. Lenormant and his son has forced this commission to sit and examine evidence so damnable; but the

committee should go still farther, and expose the movers of this attempt to poison the well-springs of history.

WOOD CARVINGS.—It would seem from recent public sales, that pictures are not the only works of Art which may be calculated on as "safe investments." Some carvings by Mr. Rogers, consisting of cornices, glass-frames, &c., that belonged to Mr. Strahan, realised considerably more than the artist received for them; and at the sale of Lord Orford's pictures and articles of *verdit*, two pilasters were bought by a dealer for 210*l.*, a dead cock, &c., for 46*l.*, and other carvings—all the work of Mr. Rogers—at prices much beyond their original cost. The bust, in wood, of Charles II., by Grieling Gibbons, which, we believe, Mr. Rogers disposed of some years ago to Lord Orford for little more than 20*l.*, realised 55 guineas: it was purchased, as we understood, by some agent of the Government, for the nation.

HOME FOR GENTLEWOMEN.—Since the establishment of this Institution some seven years ago, we have on more than one occasion advocated its claims upon the favourable consideration of the benevolent. We are again induced to bring them before our readers, and we do this with the less hesitation because the Institution is one peculiarly worthy of their notice and assistance; its object being, as its name implies, to afford a home for those ladies who have been in comfortable and even affluent circumstances: and we expect there are comparatively few of our subscribers who can so far calculate upon the future as to be able to urge, as a plea for refusing aid, that such a "Home" may not hereafter prove a blessing to them or their friends. The two houses in Queen Square at present devoted to the purposes of the Institution will accommodate fifty-seven residents only; it is usually quite full, and there are generally candidates waiting admission. During the late war, the funds of the "Home" have been materially affected, both by diminished subscriptions and by the increased cost of maintaining an establishment of some sixty persons, in consequence of the great advance in the price of provisions generally. Were it not for these two causes, the Committee would doubtless have been able to announce the liquidation of a considerable debt arising out of the heavy expense of furnishing and adapting the premises for so large a number of inmates. However, with the view of relieving the Institution from such an obstacle to its efficient working, some friends have resolved to contribute a sum of £10 each to this especial object—twenty-one names are already on the list out of forty required for the purpose; surely the remaining eleven cannot be long absent from the list when these facts are made known. But we would not only desire to assist in procuring these £10 subscribers, but would appeal generally for pecuniary aid to this excellent Institution, as one requiring large and general sympathy, and eminently deserving of it.

PICTURE DEALING IN GLASGOW.—Under this heading a statement appeared in our June number, of some transactions in connection with the sale of a picture said to be painted by Mr. Branwhite. In our remarks we asked, "all we now desire to know is, what has become of 'the copy?'"—the copy having been returned to Mr. Flatow with the original, the latter his own property. Mr. Flatow has given us the assurance that the copy is destroyed, and also that so far from making "a good thing" of the business,—as it certainly appeared he had done from the information which had reached us,—he has actually been a loser by the transaction.

THE QUEEN has recently purchased a little gem of wood-sculpture, executed by Mr. Perry, late of Taunton, but now settled in London, some of whose works have been engraved in our Journal. It is circular in form, and represents a nightingale pouring forth his song from a hawthorn bough, well covered with leaves and flowers, the graceful and natural disposition of which is admirably preserved; the under-cutting of these must have given the sculptor considerable trouble. The whole group is carved out of a solid block of lime wood, and is mounted upon a background of crimson velvet, which shows up the work to great advantage; a dome-shaped glass secures the delicate white wood from dust and damp, and this is again mounted on, or rather affixed to, an outer frame of the same wood, decorated with carved wreaths of lilies of the valley.

REVIEWS.

LIFE OF THOMAS GAINSBOROUGH, R.A. By the late G. W. FULCHER. Edited by his SON. Published by LONGMAN & Co., London.

Nearly seventy years after the death of Gainsborough, we have here a history of his life: it is true that in Allan Cunningham's "Lives of British Painters and Sculptors" some thirty pages are devoted to the same subject, but these are quite insufficient for the purpose. It is very probable, however, that Cunningham's record is all the world would ever have known of the painter, if Mr. Fulcher, who, if we mistake not, was an inhabitant of Sudbury, the town in which Gainsborough was born, had not been at some pains to collect such materials as he could get together for compiling a biography of the artist. Our own experience assures us of the difficulty there is in writing a history of the living painter: how much greater must it then be when the subject taken in hand by the author has long passed away, leaving behind him few memorials of his existence, except the pictures which have immortalised his name? And yet Mr. Fulcher has succeeded, with the help of preceding writers, and of Gainsborough's surviving representatives, to get together a very pleasant story: true it is that, with the exception of sundry letters written by the artist, there is little we have not heard or read before; but the author's own comments on the painter's life and works, some anecdotes connected with the latter, which are new to us, and the collected opinions of other writers upon his pictures, contribute altogether in making this a very welcome volume of artistic biography. As we are preparing some engravings from the works of Gainsborough, to appear in our series of "British Artists," and shall then find it necessary to refer to this book, we postpone for the present any extracts we might otherwise have been induced to print from it. A list of Gainsborough's works, with the names of their present possessors, so far as they can be ascertained, is appended at the close of the "Life;" it forms a very useful portion of the volume.

THE OPENING OF THE GREAT EXHIBITION OF 1851.

Engraved by S. BELLIN, from the Picture by H. C. SELOUS. Published by T. BOYS, London.

At length this long-looked-for engraving has made its appearance; a work which has occupied nearly five years in the execution—a period of long duration, and yet not long when we look at the size of the plate, and count the number of portraits—one hundred—which it contains: portraits of the leading personages who took part in the ceremony—the Queen, her Royal Consort, and several members of their family, lords and ladies in attendance, commissioners and jurors of the Exhibition, both British and foreign; in fact, of almost every individual prominently connected with that vast undertaking, all of whom, we believe, with two exceptions, sat to the artist. It may, perhaps, be considered by many that this engraving, from the lapse of time since the event took place which it commemorates, will have lost much of the interest that would of necessity have attached to it had it appeared two or three years ago: we do not think such will prove to be the case—nor is there any valid reason, but the contrary, why it should. The Industrial Exhibition of 1851 was a great epoch in the commercial history of the world—the precursor of other events of a similar nature elsewhere: to this day the nations of the earth feel the influence of its results, and are deriving advantages from it, and will, doubtless, for ages to come. Such a memorial, therefore, as this print offers can never be out of time, any more than the representation of some important historical event that happened long years ago would be considered in the same light. As regards the engraving itself, we would merely say it is unquestionably the only worthy pictorial record of this imposing ceremony that has appeared; the composition, for a work of its class, is singularly picturesque; and Mr. Bellin, in his skilful and effective translation, has done ample justice to the painter. Of the many hundreds who took part in the Exhibition, there must certainly be a large number to whom this memorial will prove most acceptable.

BOLTON ABBEY IN THE OLDEN TIME. Engraved by W. T. DAVEY, from the Picture by SIR E. LANDSEER, R.A. Published by T. BOYS, London.

The unparalleled success of the engraving, by S. Cousins, of this picture has induced Mr. Boys to reproduce it on a smaller scale than that first published several years since, the early proofs of which now realise an almost fabulous sum. It is scarcely too much to assume that fine impressions of Mr.

Davey's plate will "follow hard" upon their antecedents, for, without any disparagement to the splendid production of Mr. Cousins' graver, the new plate, in brilliancy, power, expression, and finish, will, with those connoisseurs who care not for size, prove a formidable rival to the older work. We heartily congratulate Mr. Davey on his entire success, and the publisher on his good fortune to be so ably supported in his speculation; scarcely a speculation, however, we expect—rather a certainty. The plate has, we understand, had the benefit of Landseer's superintendence and touches; of this there can be little doubt, judging from its character: it is almost wholly in line, with a mixture, where force or extreme delicacy is required, of etching and stipple.

HERTHA. By FREDERIKA BREMER. Published by A. HALL, VIRLUE & Co., London.

HERTHA is the most remarkable, though not the most pleasing, book that has been produced by the fluent pen and thoughtful brain of Frederika Bremer. It is not the most "pleasing," simply because it deals with a "social evil" which it cannot be pleasant to contemplate. It is, however, an evil well worth thinking over, more especially *now*, when our legislators have debated, and are still to debate, concerning the position that women occupy in England: this is not the place to argue whether English women have, or have not, reason to complain of the laws as they stand; but only to solicit attention to what seems to us, as it has done to Miss Bremer, the state of positive bondage in which unmarried women are held in Sweden. Miss Bremer has wrought the evils arising from this bondage into a deeply interesting tale, carefully developed, manifesting something of her old philosophy, but still more of the new light, whose beams are penetrating into her inmost soul. We imagine such a work, from such authority, must excite considerable interest in Sweden. Miss Bremer is respected by all; she leads many; and we cannot but think this a very brave book, written with a firm hand, and a high motive. The English reader must bear in mind that it was *written for Sweden*; but it has enough of world-wide interest and sympathy to create a home for itself, both here and in America. Those who are discontented with some of the phases of social English life would do well, while reading the trials which "Hertha" so heroically endured, to balance the good and evil that belong to women's position in England; and if they do so, disabusing their minds as much as possible of the influence "party" insensibly acquires—comparing "this" and "that" together—those who are clear-sighted as well as strong-minded, will have much to be thankful for in the enjoyment of such a birthright as England gives her daughters. "Hertha" possesses also the advantage of being translated by Mary Howitt.

KIRBY & SPENCE'S ENTOMOLOGY. Published by LONGMAN, BROWN, GREEN, & LONGMAN, London.

It is the sign of a healthy and earnest spirit, when editions of books connected with natural history "go off" rapidly. This is the Seventh Edition of what might be called "the practical poetry of the insect-world;" it is now published at one-sixth of the price of the sixth edition, "so as to bring it within reach of all desirous of becoming acquainted with the natural history of insects, and thus carrying out more effectually the object of the authors—that of introducing others to a branch of science which they had found so delightful. It is matter of regret how much enjoyment we lose through want of observation, and also ignorance of what we do observe; dwellers in the country, even when "town-bred," would find their happiness increased by cultivating an acquaintance with the life to be found, not only by every way-side, but on every herb and blade of grass. Nothing increases our own vitality so much as sympathy with the vitality of this abounding world. We cannot feel "dull" or "lonely," if we seek acquaintance with those atoms of life which the great Creator does not consider beneath His care. This volume teaches that not only are we to consider nothing "common or unclean," but that we must not think more highly of ourselves than we ought to think, when the bee and the ant, and scores of others of the insect world, are gifted with an instinct so akin to reason that the distinction is almost a myth. The present volume is really a boon to young and old.

ANCIENT CROSSES AND OTHER ANTIQUITIES IN THE WEST OF CORNWALL. Drawn and Engraved by J. T. BLIGHT. Published by SIMPKIN & MARSHALL, London.

This work is entirely the production of the local press of Cornwall, a county long and deservedly

celebrated for its antiquities. Some of the most ancient and interesting of these are depicted in this unpretending and useful volume. The descriptive portion is very brief, but the pictorial one extensive; the volume consisting of a series of boldly executed wood engravings of nearly seventy antiquities of a remarkable kind; evincing much careful research on the part of the artist who has devoted himself to their delineation. The antiquaries of England owe much to the unpretending labours of such men, who bring to the shelves of the student the result of much wearisome travel in outlying districts, for the general aid of science and history.

LECTURES ON CHURCH-BUILDING. WITH SOME PRACTICAL REMARKS ON BELLS AND CLOCKS. By E. B. DENISON, M.A., one of Her Majesty's Counsel. Published by BELL & DALDY, London; G. & T. BROOKE, Doncaster.

The rebuilding of the fine new church at Doncaster, in lieu of that burnt down about three years since, induced Mr. Denison to doff his silk gown for a season, while he delivered to the inhabitants of the town this interesting series of lectures on ecclesiastical architecture—a subject in which the learned gentleman seems as much at home as he doubtless is in the weighty matters of the law. Mr. Denison is a great admirer of the Gothic; and would have every place of sacred worship—whether church, meeting-house, or synagogue—built in a style of magnificence worthy of its objects. He is no advocate of lath-and-plaster churches, and ridicules justly, as we think, the utilitarian spirit of an age that will expend thousands upon a railway-station, and grudge its tens to aid in the erection of a church. As an example, he refers to the Great Northern Railway Company, the shareholders of which, with an income of about one million a-year, and having its principal works at Doncaster, employing "a locomotive population large enough to form a separate parish, would neither contribute anything towards rebuilding the church of the parish where they own this vast property, nor even allow their directors, when they proposed it, to spend as much as the value of a couple of railway-engines, or a dozen carriages, in building a church for this population of their own." The style of these lectures is colloquial, and free from all unnecessary technicalities, and therefore the exact kind of addresses which should be delivered to a general audience; and yet nothing relating to the subject, both externally and internally, is omitted. The materials as well as the architecture suitable for church-building are fully discussed.

SIX VIEWS OF OPERATIONS IN THE BALTIC IN 1855. From Sketches by Commander B. KING, R.N. Lithographed and published by DAY & SONS, London.

These views are illustrations of some of the minor transactions in which our fleets took part during the late war; transactions of small importance in themselves compared with the great events that occupied so much of our thoughts during the last year, yet contributing in no small degree to bring the contest to a termination. Commander King is the son of Captain J. D. King, an amateur artist, and an old honorary contributor to the exhibitions of the Royal Academy: he served during the war on board one of the vessels—the *Magicienne* or the *Arrogant*—the former we believe, and was present at the operations he has sketched—the "Blowing up of Fort Rotschensolm," the "Engagement of the *Magicienne* with the Russian Horse Artillery," "Burning by boats' crews of twenty-nine Russian vessels," &c. &c. The subjects, as may be supposed, have little pictorial beauty to recommend them, but the incidents appear to be very faithfully represented, and with considerable artistic power. The best portions of the pictures are the skies and water; there is a liquid transparency in the one, and a luminous quality in the other, that show attentive observation of nature.

THE COLLODION PROCESS. By THOMAS H. HENNAH.

Mr. Hennah is well known to be one of the most successful operators in Photography, especially with the Collodion process. In his manual he has given in simple words his modes of manipulation, and where necessary he has added something in explanation. The value of this small treatise is proved by its having rapidly passed through three editions. In this, the fourth edition, we find some new and valuable matter. We confidently recommend "The Collodion Process," as a useful text-book to the Photographic amateur, and it will be found of considerable value to the practised artist.

THE PRINCIPLES OF FORM IN ORNAMENTAL ART. By CHARLES MARTEL. Published by WINSOR & NEWTON, London.

There is a vast deal of information crowded into this little manual—information of a kind with which those whose business it is to know the canons of ornamental Art, ere they attempt to practise it, ought to be acquainted. Mr. Martel's remarks refer chiefly to form in its relation to Architectonics and Ceramic Art—those arts of which the Greeks have left us such illustrative examples. In the chapter on "Imitational Ornament" he speaks of Wallis, of Louth, as a rival in wood-carving to Grinling Gibbons, but does not even mention Rogers. Mr. Wallis is an artist of very great merit, but precedence ought not to be given him over Mr. Rogers.

HOPES AND FEARS. Engraved by W. HOLL, from Drawings by J. J. JENKINS. Published by FULLER & Co., London.

These two prints form another artistic contribution to the events, real or imaginary, that have grown out of the late war. They represent respectively the inside and exterior of a cottage at the time of evening: in the former, a young mother, whose infant sleeps soundly in a cradle by her side, is kneeling on a chair at her devotions; through the window at her back is seen the profile of her husband, recognised, or about to be, by his dog in the room, for his head is pointed that way with marked attention. In the other print appears the soldier, looking earnestly through the window at his wife and child; his left knee is bound up from the wounds received in his encounter with the enemy. We do not quite see the application of the titles to the subjects, the only indication of "fear" consisting in the soldier having allowed his stick to fall from his hand when he perceives his wife thus engaged, as if he were apprehensive some calamity had overtaken her during his absence; but, nevertheless, they make a very pretty and interesting pair of prints: the figures are Freuch.

COMPENSATION: A STORY OF REAL LIFE THIRTY YEARS AGO. 2 vols. Published by PARKER, West Strand.

There is much to interest and instruct in these volumes—a fair share of incident, and some characters life-like and vigorous. It is trite to repeat that "truth is strange—stranger than fiction;" but some of the incidents recorded in these pages are so "strange," that we are bound to believe they are *not* fiction. There is enough matter to spread into three volumes; and the multiplicity of actors rather impedes the progress of the story. The strife between interests and affections is by no means confined to time or class, but passes surely on, carrying thousands to misery and destruction. We recognise a good deal of the actual past in **COMPENSATION**. Amongst many, the sketch of the poet's breakfast, in the second volume, is certainly more faithful to the reality of the scene in St. James's Place than anything on the subject yet given to the public; and the conversations abound with spirit.

THE VOYAGE OF LIFE. Engraved by J. SMILLIE, from the picture by T. COLE. Plate 4. Proprietor and publisher, the REV. GORHAM D. ABBOTT, Spingler Institute, New York.

In our number for March last we reviewed the first three plates, forming a portion of this series of pictures; the fourth and concluding plate has just reached us, and, as we anticipated, it is fully entitled to all the favourable remarks which the preceding prints called forth. In the last we left the voyager on the stream of time, hurrying down its waters amid all the dangers and temptations by which manhood is beset: in the plate now before us we see an old man, in his shattered and worn bark, calmly issuing from the river towards a vast interminable ocean, over which the spirit of darkness sits brooding; the upper part of the sky is bright, revealing a troop of angels prepared to welcome him to his final rest—the guardian angel who has attended him through the journey directs his notice to the glory that awaits him. The subject, though exhibiting only the slightest materials, is most poetic; indeed, the entire series possesses this element of Art in a very eminent degree. The painter, who, we regret to say, has not lived to see this result of his labours, aimed to make landscape-painting teach a valuable and instructive lesson: his pencil has spoken eloquently and picturesquely the ordinary story of life. We have rarely had before us a series of engravings that afforded us so much pleasure to examine: they must materially tend to advance the Arts of America, not only in that country but in the opinion of Europeans.

THE ART-JOURNAL.

LONDON, SEPTEMBER 1, 1856.

THE ROYAL ACADEMY.

VERY high authority, in matters of taste as in other things, has pronounced Trafalgar Square to be "the finest site in Europe." Declining in this case, as has happened to us in many a case besides, to ratify the verdict of "very high authority," we can still admit the claim of Trafalgar Square to be considered the finest location in the metropolis of England; and all the improvements which time will surely bring in the grand line of avenue that stretches away from it to the Palace and Abbey of Westminster, will add more and more to the beauty and dignity of the site. On the highest ground of this commanding area—on that chosen spot of a chosen space which groups all the great features of the growing avenue into its point of view—the National Gallery and the Royal Academy have, by favour of the nation, for many years kept house together.

It is in the natural progress of youthful institutions that are well housed and generously nourished, to outgrow the accommodations devised for their childhood; and these two establishments have, accordingly—notwithstanding some original defects of constitution in each case, and a more than ordinary oversight on the part of the nurses in the case of the first (the National Gallery)—so expanded in limb and stature as long since to jostle each other in the building which they occupy in common, and to be each in the way of a full and fair development of the other's proportions. The National Gallery, in especial, has grown into so rich a promise, and so great is the future projected for it, that the entire edifice of which it occupies only half, with all its capacities for enlargement, is, as we argued last month, wholly inadequate to their realisation.

Were this not so, it must be distinctly understood, that the entire edifice was available for the purposes of the national collection. It is important to the argument which we have hereafter to maintain, to have it clearly borne in mind, that the Royal Academy, though occupying in common, has no right concurrent, with the National Gallery. It is established by the evidence of official witnesses, and affirmed by the reports of consecutive committees, that the occupancy of the Royal Academy in Trafalgar Square is merely expedient and provisional, contingent on the convenience of the neighbour institution, and determinable at any time on the demand of its trustees. The present President of the Royal Academy, himself, takes no larger view, in that respect, of the rights of the institution over which he presides, than one which admits its liability to removal, on the condition of its having accommodations not inferior to its present ones provided for it elsewhere. There are many among the public who, looking at the Academy, as a private society, working out its own objects irresponsibly and in its own way, and possessed of large funds of its own, drawn to a great extent from the public through a sort of trading medium, deny its right to be housed at the national cost at all. For ourselves, we can

take no such narrow view of the matter. Seeing the long period of years during which this institution has been so lodged by the nation, the many useful objects which it has carried out in the accommodations thus provided, and the many noble uses which it has made of the funds there acquired, we think the Academy has an excellent case of prescription supporting its claim to at least such amount of aid in this respect as was originally provided for it, by George III., in Somerset House. But, to its present apartments in Trafalgar Square, we repeat, the Royal Academy has no right beyond that of a tenancy at will;—and it follows *à fortiori*, that, to any suggested enlargement of such accommodations it must show a title on grounds altogether new and distinct from those which sustain its present prescription. The claim to subsidy *at all*, apart from the prescription, must build in this day on arguments very different from those which justified the original beneficence of George III. That in the time of the early struggle of our native Arts into academic figure and corporate action, the king should save the young society the expense of house rent, which it had not means of its own to pay, is intelligible now, as it was reasonable then;—but, that the nation should be held to have thereby contracted an obligation to enlarge indefinitely its provision in this kind with the enlarging figure of the institution, when the very growth which creates the necessity for the enlarged provision has supplied amply to the institution itself the means of furnishing it, is an inference too violent and illogical to be suggested in terms. If the Royal Academy, now a rich and prosperous body, has something of great value to ask from the nation, to which it can show no existing title, then, we suppose, it is prepared to give to the nation, in return, something which the nation already has not, and which it is important that it should have.—Well, then, the matter stands thus. The building in Trafalgar Square is, as we have said, far too small for the combined objects of the two institutions which at present it houses,—and that one of the two which has had at any time the right to the whole, enforceable by the expulsion of the other (the Royal Academy), is, nevertheless, about to emigrate in search of yet larger capabilities than even that whole would supply. Thereupon, the Royal Academy, for whose more limited objects the entire building about to be thus partially vacated would furnish a majestic space, aspires to extend its tenure, which at present is of a part and for a time, into a possession of the whole and for ever. This is a very large demand, and should have something very substantive to show as a consideration. Why should the nation give away its finest site (and a site by some prized over all other sites in Europe) save for some important national object? The Government that bestows this grand location will have to show good cause for its appropriation. The very courage to ask for such an endowment can have been inspired, it may be assumed, only by the disposition to concede whatever can properly be demanded on behalf of those for whom the government granting are trustees. To make a title, the Academy should be prepared to renew itself in the spirit, and to the dimensions, of the gift. Such a title we, for one, would be disposed freely to accept. We can, for ourselves, see good grounds of public policy why the Academy should have this building,—but then, the Academy must be ready to give to those grounds of public policy their due place and weight. In a word, this palace and its site, the property of the nation, must be paid for, if not all in money (and the money value would absorb the funds of the Academy, large as they are, four times over), in something which the nation deems to be money's worth. Now, it has long been widely felt that—much for its own sake, and more for the sake of the public—for a great addition to its own dignity, and for the far more complete fulfilment of its mission—certain reforms are needed in the Royal Academy which the public has had no power to enforce on a private association. The time to make terms is now, when the Academy is a petitioner to so vast an extent. To a private society this magnificent property, built for a national institution, and admirably fitted for some great national object, cannot—or should not—be given away. In every respect the Academy has, we think, a great opportunity just now before it, which, if it neglect, must ultimately fall to the adoption of some other institu-

tion than itself; and it is in a spirit of respect for it and its history—for its workers and their works,—and almost as much, we repeat, in its own interest as in the interest of the public,—that we think it well to discuss here the conditions on which Government might wisely treat with it for a full possession of the building in Trafalgar Square, when the removal of the National Gallery shall leave that great property open to a new destination.

That the Royal Academy has pressing need of further space, to enable it to carry out worthily the objects of which it has charge, no one who has looked with interest on the growth of Art and the struggles of artists in this country will deny;—and we, for one, would gladly see such space liberally assigned to it, on the sole condition that it shall understand in a far larger sense than it now does the nature of its trust,—and rise, as it has never yet done, to the dignity of its mission. There is no year that does not bring this insufficiency of space painfully before the public; and part of the resentment which is not properly visitable on the Academy on this account falls on it, nevertheless, because of that narrowness of view in other respects which is felt as constituting a sound objection to its endowment with more extended means. In its moments of irritation or of disappointment, the public does not readily distinguish between that which the Academy does not do because it cannot, and that which it does not do though it might;—particularly if there be a feeling that the latter failing has some relation to, and dependence on, the former.—Take as an instance of the insufficiency in question, the treatment which the highest branch of the Arts, Sculpture, has received annually at the exhibitions in Trafalgar Square; and it will be felt that it would be difficult to find a more striking expression than this of the utter inadequacy to the true purposes of such an institution, either of the Academy or of its means. We fear, that in this case the blame is to be shared between them,—the body itself, and the means which it commands. While there is, beyond all question, within the present walls a lamentable want of spaces suitable to the exhibition of sculpture, it is equally certain that the academicians have not made, in favour of their sculptor brethren, a generous use of the spaces which have been at their disposal, and have not shown generally such an interest in this most spiritual portion of their trust as they could now put confidently forward for a title to a larger endowment.—Then, as another instance, the multitude of deserving pictures which are constantly rejected from the exhibitions of the Royal Academy for want of wall to hang them on, forms, from the extent of its application, the most distressing incident of the artist-year. When we take into account the long months of toil, and anxiety, and aspiration which have preceded the birth of each one of these pictures, it is impossible not to feel sensibly the disappointment of the painter at a repulse which is not upon the merits. They who have the arrangements of each year have many hard things to bear in adjusting the comparative claims of the excellence for which there is room; but they must feel as hardest of all the necessity under which they labour of turning merit absolutely away on ground so merely extrinsic as that of want of accommodation.—Unhappily, however, under the present narrow dispensation, there is a worse fate even than that of being rejected. By the necessities of the case, for many an unfortunate picture the true road to non-exhibition is to be hung on the walls of the Royal Academy. The vast disproportion between the amount of wall which *can* be occupied, and the number of works claiming to be its occupants, brings all the high lines and dark corners of the former into requisition. Some picture into which the artist may have wrought his passion for the beautiful and his thirst for fame, and on which he has expended the labour that was, perhaps, to buy his children's bread for the year, is, on the auspicious May-Monday which, as he hopes, is to re-admit himself and introduce the public to its presence, by him discovered only after an anxious hunt—courting obscurity in some secluded nook, under the shelter of two neighbouring frames,—and by the public never discovered at all. Whole rows of works, each one the exponent, after its kind, of a glowing sense or of a patient thought, are ranged along the roof-line,—placed for immortality according to that material version which looks *up* for it, but missing it by the distance which reduces their themes

to simple riddles—as if the hanger had been the Sphinx, and the catalogue were *Œdipus*. Many a wound of the heart is carried home from the crowded rooms of the Royal Academy on that first Monday in the merry month of May. There is, as we have said, most pressing need of a remedy for all this,—for spaces at the disposal of the Academy in which every candidate picture can be exhibited that deserves exhibition, and no one shall be hung where it cannot be fairly seen.

For these latter expressions of the existing insufficiency the body of the Royal Academy are, of course, not to blame,—save in that secondary sense in which they fail so to attract the public esteem to the greatness of their trust, as to command from the public sympathy ample means for its whole fulfilment. To this end they must give to that trust in many particulars a new and enlarged interpretation. The spirit and requirements of the age have far outgrown the narrow scheme of the institution; and in our desire for a reconsideration of that scheme, in view of the opportunity which now presents itself of providing the means to carry out its reconstruction on a grander scale, we have, as we know, the sympathy of the artist body in general, and of some intelligent and far-seeing members of the Academy itself.

The first thing to be amended in conformity with the spirit of the times in which we live, is a radical defect in the original constitution of the Academy itself. We have, in the course of this article, more than once spoken of this institution as “a private society,”—and we dare say there is a large body of the public, accustomed to look on the Academy, in its national palace, as the custodian and representative of national Art, to whom the term will seem to convey a misdescription. Nevertheless, a private society the Academy is,—and that closest and most exclusive kind of private society which has a royal master. No great and comprehensive national aims can be with certainty carried out under the dispensation to which it belongs. That liveried service which Art, like some of her spiritual brotherhood, was content to enter a century since, is wholly unworthy of the position which an enlightened nation desires that it should hold for the future, and which, so far as depends on the artists themselves, they should determine that it shall hold now. Ninety years ago, the Royal Academy was born in a royal palace,—and conveyed to its first apartments, in Somerset House, down the back stairs. The academicians held, and hold, their title individually by diploma from the king,—and are dismissable, on any ground of delinquency, only by his consent. The treasurer and librarian are appointed by the king,—and the nominations of the secretary and keeper must have the royal approval. The president is elected annually; but, as the practice has been to continue the individual once elected in the office for life, and as all other officers and professors remain such only during the king's pleasure, he and they are in effect little better than officers of the crown. The accounts of the Academy are laid before the king:—and, in a word, the Academy, instead of being what the age demands, a national, continues to be what it was born, a Royal Academy. Nor let it be supposed that this incident of royal patronage has remained only a constitutional theory,—or that the right of royal interference, even in those cases where the elections appeared to be free, has existed as a mere dead letter. The whisperer has found his way into the royal closet at election time, and the veto has been exercised, and on political grounds. —It may amuse our readers if we record here, as an illustration, an instance in which this veto was worked, as related in a contemporary publication, to the effect of a practical self-stultification. The keeper of the Royal Academy has charge of the nascent Art of the country in the persons of the students, whose progress in its schools he has to superintend and direct; and for this office, so important to the future of the profession, the academicians at one time selected, from amongst themselves, as one most highly qualified, the elder Smirke. The appointment was forwarded to the king, George the Third, for confirmation, according to the constitutions. But some one had been up the back stairs before it came, and whispered in the royal ear a ground of disqualification. Mr. Smirke, it was alleged, had been seen at Thelwall's lectures,—and democracy was a necessary interference in the logic that in those days used the

back stairs. It was also logic in the closet that a democrat could not teach painting:—and George the Third, accordingly, put his veto on the nomination. It is difficult to suspect the academic diplomacy which drank from these court waters, of a royal mystification; but certain it is, that the rebuked academicians offered for the acceptance of the rebuking monarch, as a substitute for the mild democracy that was suspected, the close friend and ally of the democracy that was notorious and apostolic. Somehow, however, the whisperer this time missed the back stairs:—and the king, who had rejected Smirke, confirmed the election in his stead of Fuseli, the ally of Godwin and of Mary Wollstonecroft!—The illustration our readers will, we dare say, think was worth the digression; and it will be easily seen, as we have said, that this is not a wholesome constitution for an Academy of the Arts. A body whose independent action within is restrained by the prerogative cannot pretend to a large and independent action without; and a society which has no accountability anywhere, save in so far as it may choose to acknowledge the authority of public opinion, must not complain if it fails to win the public confidence. Nor do we think it accordant with the spirit of the times in which we live, or befitting the position which Art has now taken up as an influence amongst us, that the Crown should *desire* to take some particular Art-institution under its wing, and maintain its prerogatively as against the rest of the artists of England. While it does so, those outside the pale of the privilege are, by royal decree, fighting the battle of their lives at a disadvantage,—carrying heavy weight in the race for fame and the strife for bread. They have to contribute their bricks to the temple of English Art without the help of the straw which the Crown dispenses to the more favoured workers within the walls of the Academy. There can be no great action of the kind which we seek to recommend under this narrow and antiquated scheme:—and it will be well, therefore, that we should pass on to a consideration of the other changes which we desire to see carried out as embodying that enlarged action, that these may assist us in afterwards suggesting the fit method of cure for this defect of constitution.

It is, as we have said, nearly ninety years ago—on the 10th of December, 1768—that the Royal Academy of Arts was founded; and either the scale of the establishment was far too large for that early time, or it is far too narrow now. If forty academicians and twenty associates, with the few engravers added, were then no more than a sufficient representation of the body of English artists, they must, even on the false principle in use, form a wholly inadequate representation after the constituency has increased certainly more than fourfold. If, ninety years ago, sixty men could be found worthy of the prizes of the profession,—then, either the prizes are now far too few, or the Arts have declined in England in exactly the same ratio as the artists have increased. Here, the absurdity of the arbitrary and unelastic principle is at once apparent. But, the real error is, that there should be any limitation at all,—that rules should affect to define what must make its own definition, to adjust that which can only adjust itself. To say, that there shall always be sixty persons worthy to wear the laurel, is, to decree that which no Academy, Royal or National, can command:—to say, that there shall never be more, is to put fetters on the wing of Art, which, nevertheless, whenever it is strong and vigorous it will shake off:—to say, that there may be a hundred such persons, but only sixty laurel crowns, is, to wrong the other forty. We have never watched an election for a vacant associateship, in which half a dozen men, perhaps, of equal merit stood for the honour, and the one success made five bitter disappointments, without a feeling of pain. Even if the course of years should ultimately place the six side by side in the Academy, the inequality in the measure of justice severally administered to them has still to be calculated by the length of precedence which one has had over the other. Even as between *them alone*, the matter never comes wholly right:—while, behind them, new candidates, in whose way they must stand, are yearly coming up,—till, in the press of those who crowd the narrow avenue by which the Academy is reached, many a brave heart goes down, never to rise again. By the system of limitation, it cannot be but that many *must* be left behind as well

entitled to wear the academic honours as those who won them:—and the institution which so operates on the Arts of which it affects to have charge, is but a private benefit society,—not a national and fostering institution, and not entitled to be lodged in the palaces of the nation. Instead of a great reconciling and harmonising influence, which the Academy should be, artist-life has been soured and saddened by the heartburnings and heartaches which its privilege creates. The wrong and the evil fall everywhere:—as much on the Academy which loses the distinguished artist, as on the distinguished artist who misses the Academy. Every man of due qualification who is excluded from an association that undertakes to present in itself the body of recognised English Art, suffers an injustice, and has a mark of depreciation set on him by authority:—and the great corporate figure of the association itself loses something for every great artist that it omits from its list of associates. Surely a scheme that should sweep into the system of the Academy all that is illustrious in the Arts of England, must of necessity give to it a grander presence in the eyes of Europe. The means seem very simple. Why, if an Englishman of eminence knocks for admission at the door of the Academy, should there be the slightest difficulty in opening and letting him in? Why should the academic recognition of his merit be made contingent on death? Why should not the associateship be in the nature of a degree conferred at a university—a certificate of excellence—call it what you will,—but which every artist should be entitled to claim who had proved the excellence which is the qualification? The details of such a scheme need not be here discussed. When the principle shall have been affirmed, they can easily be settled so as to invade no existing right while recognising rights that have hitherto been ignored. It might, for instance, be thought well to give a diploma of associateship not implying membership,—leading, or not leading, to an associate-membership,—as that should lead, or not, up to the academicians' chair:—but nowhere any limitation save the limit of desert. In any case, it would be necessary to have two classes of associateship at first, in order to save the privilege of those who have already acquired it. Whether or not the present number of full academicians should be increased, is a matter of little importance; though probably some augmentation—say, to fifty, or sixty—might be desirable, on account of the greatly enlarged constituency from which the academicians would have to be chosen. At any rate, the academicians' chair would remain, as it is now, the great final prize of the profession,—and would surely gain in dignity from the larger and more enriched basis on which it would be made to stand. In order yet further to enhance that dignity, the academicians should in future be elected, not, as now, by themselves, but by the whole body of associates:—which, under the new constitution, would be, all that is illustrious in the profession. The academicians would elect amongst themselves, as now, their own president, council, &c.:—though it might, perhaps, be made a question, how far it would subserve the interests and dignity of Art, that an honour so great as that of the presidency should pass periodically from hand to hand among the distinguished members of the body,—as it does in the academies which compose the Institute of France. But, as we have said, all these details, and a hundred others, remain for consideration hereafter. All that we desire now, is, to suggest a machinery of some kind by which a long-standing evil may be redressed, and an illustrious private body of artists may elevate themselves into a great National Academy of Art.

The Academy having thus acquired the power of associating to itself all the Art ability which could minister to its illustration, the enlarged figure would naturally suggest larger views, and a new and vigorous constitution would stimulate to a more vigorous course of action. We should probably get quit of all such prescriptions as “a chaplain of high rank,” all nominal memberships and non-professing professorships, and such other showy appendages as could only have hung themselves round a system born into the spirit and wearing the livery of a court. Would it be believed, that a body assuming to be teachers of the Arts which they also illustrate, and having faith in the dignity of their own mission, should have “a Professor of Ancient History,” and “a Professor of Ancient Literature,” who are for-

mally elected only that, being "men of distinguished reputation," they may throw the light of that reputation on the Academy,—from whom no duties are demanded, and by whom none are paid? How all this savours of tinsel and second-hand state! One only wonders how the illustrious men whom the Academy thus contrives to make part of its pageantry consent to hold their offices as "dummies." It is probable, too, that the regenerated institution will get rid of the annual dinner,—if it were only for the purpose of shaking off the spirit of fawning and subserviency embodied in the law which regulates the invitations. "The guests," says this enactment, "shall consist exclusively of persons in elevated situations, of high rank, distinguished talents, or known patrons of Art." Of what a concentration of sordidness and sycophancy is this law the expression!—and how is the figure of a great Art-association lowered in its use!—It is scarcely necessary that we should pause here to remind our readers that for these offences in the language and spirit of the constitutions, the present body of academicians are in no degree responsible. They belong to the original conception of the Academy, and to the influences which surrounded such institutions as this in England a century ago. We know, that some of the academicians now—and we have no doubt all—would gladly get quit of these and other obnoxious clauses which present them in so unsuitable an aspect before the great body of the public and the profession in general.—But, for another abuse of the privilege which their rank confers—an abuse to which we have more than once had occasion to call attention in this Journal—the academicians must be held answerable now,—as they will be expected to make some provision for its abatement hereafter. We allude to those occasional instances of membership in which the attainment of the full honours of the Academy has been held by the recipient as dispensing from its duties,—wherein the academician maintains his claim to be considered a pillar of the institution by contributing nothing to its illustration or support. We need not refer more specifically here to those individuals who have repaid their admission into the high places of the Academy by a withdrawal of their works from its walls, and justified their title to its dignities by ceasing to deserve them. The cases are familiar to our readers;—and we insist, that theirs is a reading of the diploma which calls loudly for the parliamentary commentator. To understand the document which is an affirmation of the value to the Academy of their work, as an authority for ceasing to work for the Academy—to wear the badge of recognised ability as a dispensation from its exercise—is a discredit to the defaulting artist himself, and an insult to the body in whose exhibitions he is a defaulter. It is something like stamping a coin as gold currency, for the purpose of withdrawing it from circulation. It might be well to provide, in any reconstruction of this institution—which, by its theory, is meant to be a working institution, not a privileged asylum for indolence—that absence from its exhibition walls for more than a given time, for any other cause than sickness, infirmity, or some other reasonable ground of dispensation, to be pleaded and allowed, shall operate as an abdication of the honours to win which those walls had, before, been perseveringly used.—We would recommend, too, that in the compilation of its new laws, the Academy should exclude all express enactments which are not intended to be faithfully carried out in practice. The first section of their present constitutions defines the qualifications essential to membership;—and one of these is, that the member shall be "resident in Great Britain." The definition is precise; and the policy on which it proceeds is analogous to that on which we have been insisting, that the academician is bound by his very privilege to be an exhibitor on the walls of the Academy. It is intended that he who wears the academican's crown shall share his cares:—that he shall be in the way, to take his due part in the execution of those offices, and the division of those responsibilities that belong to the governing body into which he has been elected. As in the case of James the Second—to gratify the royal academican with a royal simile,—the academic chair should be proclaimed vacant in consequence of any prolonged absence from the seat of his government. Now, this law so positive in its terms, the academicians have taken on themselves to deal with after a fashion which in

itself was a caprice, and in its effect was a wrong. It is well known to our readers, that one of the most distinguished sculptors of modern times—whom death has, alas! removed beyond the possibility of that measure of redress which we trust is at hand—was, in conformity with the enactment, excluded from the honours of the Academy while he lived, on the express ground of his residence in Italy,—while, in violation of it, another distinguished member of the same branch of the profession wears those honours in full, though he has been a resident in the very same Italian city, we believe for twenty years.

The schools of the Royal Academy have always been ably conducted,—as they have been liberally founded, and liberally furnished with all necessary means. We suggest, indeed, that their system is too liberal,—and that under the new constitutions the eleemosynary principle on which they are conducted might well be dispensed with. The system of gratuitous instruction tends only to invite to the schools many who have little other call thither,—to sow the field of Art with weeds, many of which spring up rankly and perish miserably by the way. It is as much a proper function of an academy to discourage incompetency as it is to encourage genius. An education of any kind that may be had for nothing is a temptation in itself;—whereas, an education to be paid for is usually bought to satisfy an impulse or to cultivate a talent. We do not see why the privilege of attending the schools of the Art Academy should not be purchased by fees, on a moderate scale (with perhaps a power reserved to meet exceptional cases), as it is at the universities, at the medical and anatomical schools, and at all our other educational establishments.

But a National Academy has a far higher mission than any that we have here assigned to it yet, and the business of its professors is not ended when they have taught and lectured in the student schools. Here it is, that the Royal Academy has most signally failed to apprehend its office. It has a commission—when it shall learn to read it aright by the new lights which we hope to see supplied—to educate without as well as within its walls. It has to form as well as to feed the taste of the nation. It has to comment on all the great texts which the walls of our National and other public galleries supply,—and the Art-wealth which the nation has acquired by purchase or by gift, it has to prepare the nation to enjoy. For this purpose, its professors,—working professors all, and all paid for their labour—should lecture, not to the pupils alone, but to the public, and not in the sense only of special training, but in that also of general instruction; and the public, as well as the pupils, should pay an annual subscription or a small fee for admission to such lectures—as they do at the Royal Institution, and at other establishments of the kind in the metropolis. The exhibition admission fee, as a very large source of revenue, legitimately levied by the genius and industry of the artists themselves, and from those only who voluntarily enjoy them, and expended in a humane and generous spirit, would be of course retained; but the Government should require, that certain sufficient days in the course of the season should be set apart for the free circulation of that large body of the public to whom the charge of one shilling is a sentence of exclusion. In a word, the office of a great national incorporation like this is, by all available means, to promote the flow of the fertilising Art-waters throughout the whole framework of the society in the midst of which it is organised:—and the figure of the Academy itself, as the Genius of the waters, should be found sitting and teaching at once by the fountains and by the full stream.

Surely, such objects as these, if they constitute the duty, are also worthy the ambition of a body seeking to stand before Europe as the exponent of British Art, and asking to be munificently endowed. They suggest, as we anticipated in an early part of this article, the means of their own accomplishment. The Academy must rise, if it would achieve them, from a royal into a national institution. It must have a charter conferring on it powers commensurate with the great action sought,—embodying the conditions and recognising the demands of its new existence,—bringing it into relations with the State, instead of with the Crown,—and giving it a responsibility to the public, instead of only to itself. Again we omit details:—they will be matter for far more serious consideration than the limits of an article will permit.

But the time has come when the Academy must determine whether it will enlarge its scheme and lead the Arts of England, or remain a private society and leave that great office to some other body. The widely expanding influence of Art amongst us has made such an office a want of the times,—and somewhere the mission must fall. Nowhere would the public so willingly see it fall as on a body illustrated by a long tradition of greatness. But the academicians will do well to remember, that the Society of British Artists—the plea for whose establishment arose out of their failure of comprehensive action, and whose own successful action their large figure hitherto impeded—is seeking to follow on their track, and probably needs only their final abdication of their proper function to spring into a vigorous life. Without any public endowment, this society has already attempted to establish schools; and its want of success so far, is likely to make it only the more eager to seize on any opportunity which may present itself for taking steps to redeem its failure:—while it has a charter of its own, which it should not have required had the action of the Royal Academy been equal to the demands of the age. Nor have we forgotten that, some time since, this same Society of British Artists memorialised the Government to locate it in the galleries now occupied by the National Collection, in the event of that collection being removed elsewhere. No minister, we trust, will venture to appropriate so magnificent a property, save for the service of the public, to whom it belongs, largely secured in return. But an institution such as we have attempted to sketch, the public will willingly, we believe, see located in its palace in Trafalgar Square.

ART IN CONTINENTAL STATES.

LILLE.—*The Competition for the New Cathedral.*—We learn from a statement in a recent number of the *Builder*, that artistic competitors abroad sometimes meet with as little justice as they generally do in our own country. Our readers were lately informed that Messrs. Clutton and Burges, of London, were the successful candidates for erecting the proposed new cathedral at Lille—their designs having been selected from a large number submitted to the committee from all parts of the Continent; but it has just been determined that these gentlemen shall not carry their own plans into execution—the "exigencies of public opinion" requiring that the work should be done by a native, in whose hands the designs of the British artists have been placed, after procuring from them too "explanations and suggestions as to various proposed modifications." Unquestionably the committee had no right to call upon foreigners to compete, if they had foreseen, as they doubtless must, that public opinion would have interfered with their adjudication: their conduct is an example of bad faith which cannot be too strongly condemned. Yet, with a recollection of what is done at home, we ought to be gentle in our reproofs: in England we offer public works to the foreigner, without condescending to invite our countrymen to compete; abroad the foreigner is invited, succeeds in the competition, and the native enjoys the fruits of his labour: we scarcely know which most deserves animadversion.

PARIS.—A new regulation has just been adopted for the Louvre, which is now open to the public every day except Monday.—Intelligence has been received from Rome of the death of M. Bonnardel, the promising young sculptor who gained the first prize in the London Exhibition of 1851, and executed the first prize medal.—Ary Scheffer has sent to his native town, Rotterdam, his painting of "Christ in Gethsemane" for exhibition.

TURIN.—A marble statue of the distinguished statesman and author, Cesar Balbo, has just been inaugurated with great ceremony in this city. The statue is the work of Vela, a sculptor of high reputation in Italy: when it was uncovered, the assembled multitude recorded their approbation by a loud burst of enthusiastic cheering.

MUNICH.—The plan for the erection of an edifice for the convenience of artists and Art-societies is likely to be carried out. Above the saloons, which will serve for Art-Union Exhibitions, it is contemplated to erect two stories, one for an Art-Casino, the other for the meeting of learned societies: as many of these already exist here, so others would be formed, all of which would find in such an institution a centre of union. The building is to be erected by a company, and shares have been already taken.

THE ROYAL PICTURES.

CONSTANTINOPLE: THE GOLDEN HORN.

J. Jacobs, Painter.

T. A. Prior, Engraver.

Size of the Picture, 3 ft. 2½ in. by 2 ft. 3¼ in.

CONSTANTINOPLE has within the last two years become almost a household word; not only by every hearth throughout the British empire, but wherever the languages of England and France are spoken. Millions have had their thoughts turned with the deepest anxiety or the utmost interest towards a spot of which few comparatively knew much more than the name; and now its mosques and its minarets, its kiosks, its streets, its harbours, and its suburbs, seem almost as familiar to us as the localities in which we dwell. Dioramas and panoramas, pictures and prints, in short, everything which Art can do, have contributed to show what the metropolis of the Moslemite is. Turkey now forms a large and important page in our history; one too which both we and our children may read with mingled feelings of pride, sorrow, and shame; for over the glory of final victory broods a shadow that obscures our national self-sufficiency, though it cannot dim one spark of the brightness which rests upon the valour, fortitude, and endurance of our countrymen.

Under any circumstances, the beautiful picture which is here engraved would find numerous admirers, but as the representation of a place on which our attention has been so long and anxiously fixed, it possesses a double interest. The painter, James Jacobs, is a native of Antwerp; he was born in 1812. A pupil of the Academy of that city, he made his first appearance as an exhibitor by contributing to the *salon* of Brussels, in 1833, three pictures—"Fishermen Disembarking," "Interior of the Citadel of Antwerp after the Bombardment," during the last revolution, and a "House destroyed by a Bomb-shell;" these pictures attracted notice by the vigour of the artist's touch, and the variety and harmony of his colouring. In the Antwerp Exhibition of 1834, and especially in that of Brussels in 1836, these qualities yet more distinguished his works. In the last-named gallery he had three pictures—a "Seashore in Holland," a "Lighthouse," and a "Calm at Sea;" the first of these was purchased by the government, and the last by the Prince de Ligne. From that time to the present, Jacobs has devoted himself almost exclusively to marine-painting, or to subjects in which the sea or a navigable river forms a principal feature in the composition.

The works of this artist generally show an exuberance of rich and powerful colouring; like our own Danby, he loves to paint the gorgeous tints of sunrise and sunset; his effects are highly poetical, though perhaps sometimes a little overdone. "The truth of his pictures," writes a foreign critic, "is more poetical than real: without this defect, which is no longer one when it is not greatly exaggerated, this painter would be placed in the first rank of the modern Belgian school." This remark, we must however add, was made when Jacobs was comparatively young—study and experience have now "tamed down" his flights of poetical fancy; he retains his brilliancy and rich imagination, but restrains them within the limits of probability.

About twelve years since he visited the Mediterranean, the Greek Archipelago, and other places in the East; from one of the sketches then made he painted the picture in the Royal Collection—it represents the port of Constantinople, called the "Golden Horn," a safe, capacious, and beautiful harbour which divides the city from Pera: the painter has treated the subject as if every object in it were literally of gold, the whole is lighted up with the deep yellow and crimson tints of an Eastern sunset. In the foreground is a group of picturesque buildings of highly-decorated Saracenic architecture, constituting a wharf where vessels are unloading; this is judiciously balanced on the other side of the composition by several vessels at anchor, whose shadowed sides are opposed to the strong light behind them, while the reflected light of the sun on the water is broken by the figure and the boat, or barge, in the foreground.

This picture—a rich and gorgeous piece of painting—was, we believe, purchased of the artist by Prince Albert: it is now in the collection at Osborne.

GRANITE.

THERE are but few subjects of more interest than the study of those formations, which, from their being seated deeper beneath the earth's surface than other rocks, have been called Primary. It may appear, seeing that many of our mountain ranges, which rise high above the earth's surface, are composed of granite, that there is no sufficient reason for regarding those rocks as more deeply seated than slate and limestone. Examination will, however, prove that all the other rocks, except those which have, like the trap rocks, been forced through the more recent formations, rest upon the granite as a base. In some examples the granite has forced its way through the more recent rocks, which then lie contorted around it; or, as in others, the stratified slates repose upon it in the state in which they were at the time of their consolidation.

"Granite," says Macculloch, in his *System of Geology*, "is one of the most universal rocks, forming some of the highest and most remarkable chains of mountains. It is not, however, limited to such high ranges as the Himalaya or the Alps, or even to the much lower ridges of Britain, since it also occupies many extensive tracts of comparatively level land. This rock has been commonly supposed to be characterised by the pinnacled and serrated form of its mountains, such as the well-known summits of the Alps, and of the Isle of Arran; but this is not the case, for it assumes every variety of outline. The mountains about Loch Etive, in Scotland, have a simple conical form, which is particularly marked in Cruachan; the extensive ridge which surrounds the sources of the Dee, forming the loftiest tract of land in Britain, presents a series of heavy rounded elevations; in Cornwall, in Galloway, and in Sutherland, it offers the same uninteresting aspect; while in many parts of Aberdeenshire it occupies the lowest grounds, presenting large tracts of level surface."

When a granitic country is characterised by elevated and precipitous hills and mountains, its surface is covered with numerous detached rocks, diversified here and there with projecting tors or cairns of various fantastic forms, according to the nature of the rock, and of the eroding influences to which they have been subjected. Whenever a granitic country is composed of undulating hills, with occasional level spots, though the latter are commonly marshy, the former not unfrequently possesses a good soil.

There are many peculiarities in the external features of a granitic country. Standing upon a hill, and viewing any wide-spread district of the primary rock, the surface commonly exhibits a system of valleys which run parallel with some central ridge of granite; these longitudinal valleys are intersected by others, which cross them at right angles; and as the intermediate hills are more or less rounded, the surface of the country has an undulating appearance in both directions, which has often been compared to the roll of waves—and these varying, the curves being sometimes regular and gentle, at other times contorted and abrupt, have aptly enough been regarded as resembling the sea when agitated by the wind with different degrees of violence. The valleys thus formed become the channels of rivers, and many a romantic and beautiful scene is thus created, which show in a striking manner the dependence of the picturesque in nature upon great geological phenomena.

We have not now, however, to deal with the picturesque beauties which render the districts of primary rocks especial favourites with the landscape-painter. We have to consider merely some of the conditions of a rock which ex-

hibits many varieties, and which is of the utmost importance to the engineer and the architect. Granite, from its extreme durability, is employed in the construction of all great works which are exposed, in a peculiar degree, to the action of one or more of the elements. Our magnificent docks, in which float the largest mercantile navy in the world, are generally constructed with this stone. English and Scotch granites are considered so valuable for this purpose, that the Danish Government are now receiving large quantities of English granite for the construction of docks at Copenhagen; and some very large orders are now being executed in this stone for lighthouses and docks in the Indian seas. The great works going on at Portland will owe their strength to the use of granite, in all those parts which are exposed to the beat of the waves. The Plymouth Breakwater is constructed with blocks of limestone, which have been raised from the neighbouring quarries of Oreston. It was found, however, that this stone, between the high and low-water marks, was subjected to a curiously destructive influence—marine insects perforated it in a remarkable manner. These creatures—*Pholas dactylus*—by burrowing in the stone, were rapidly destroying it. Those perforated blocks have, however, been removed, and granite substituted, which is a stone far too hard for these borers to penetrate.

The bridges which span the Thames have been built chiefly of granite. London Bridge is a remarkable example of granitic architecture—alike for the character of the stone, and for the size of the blocks of which it is constructed. The new works at Westminster Bridge—which are, however, unfortunately suspended, owing mainly to the discussions which have arisen as to the durability and economy of the principles which have been adopted—consist of combinations of granite and iron.

Aberdeen granite, from the quarries of Dandinegairn, Rubislaw, and Tyrebagger, are extensively used in the Metropolis for kerb and paving stones; and from these quarries the base of the Duke of York's Monument was obtained. The granite of Aberdeen is a grey granite, while that of Peterhead is mainly red, and approaches more nearly to the red granite of Egypt than any other in Great Britain. The Peterhead granite was largely used in the construction of the docks at Sheerness. The pillar of the Duke of York's Monument was from the Stirling Hill quarries, and the abacus from the Seafeld quarries. The beautiful pillars in the library of the British Museum were from the neighbourhood of Peterhead. These were worked at a time when our mechanical appliances were far less perfect than they are at present; they had to be dragged from the quarries over several miles of peaty ground, and in this portion of the labour alone upwards of seventy pounds' worth of timber was expended before the four columns reached the place of shipment. The granite pillars in Fishmongers' Hall were obtained from the Stirling Hill quarries; and the bases of both the Pitt and Fox monuments came from Peterhead. The polished granite which appears on the front of the club-house in Pall Mall has been derived also from this district, as was also the polished stone employed in the new building in the Poultry, near the Mansion House. The quantity of granite shipped from Peterhead in 1855 was 368 tons; the prices obtained varying according to the quality of the stone, from 2s. to 5s. per cubic foot.

Cornish granite, and that obtained from Dartmoor, has long been celebrated. The most extensive workings at the present time are at Lemorna, a few miles from Penzance, which quarries produce a very fine granite, in blocks of almost unlimited size. The district of Constantine, near Helstone, and Carnarue, near Penryn,

CONSTANTINOPLE, THE GOLDEN HORN.

FROM THE PICTURE IN THE ROYAL COLLECTION

LONDON, PUBLISHED FOR THE PROPRIETORS

have furnished stone for many of the most important metropolitan works,—amongst others, the granite employed as the base and supports of the bronze railings at the British Museum may be named as having been derived from these quarries. The stone for the Scutari Monument is obtained from this region. The Hensborough granite is also largely employed. This and several other varieties worked in quarries in the neighbourhood of St. Austle is shipped from the port of Par. The granite obtained in this neighbourhood presents many peculiar characteristics; some of it is of a porphyritic kind, and its red and black surface renders it available for many ornamental purposes. The sarcophagus for the tomb of the Duke of Wellington is being constructed from one of the porphyries of this curious region, while the supports are worked from the finest specimens of granite obtained from the quarries of the Cheesewring district, near Liskeard. This granite has been selected for the docks at Copenhagen, for many of the more important works in our naval arsenals, and the new docks in London. The tomb of Sir William Molesworth, in the cemetery of Kensal Green, is wrought from this stone; and many persons must remember the beautiful Corinthian column which stood without the western door of the Great Exhibition, which was a fine example of the character and architectural qualities of the Cheesewring granite.

The Cornish granite exported in 1855, was 473,716 feet, which is equal to about 35,000 tons, and its value is estimated at £75,700.* The granite of the Dartmoor range varies much in character and quality, and is used in some of our largest works: at Laña, Plymouth, and Totness, 5000 tons were shipped last year.

Granite, from its durability, is commonly employed for external work, but it is capable of being worked into objects of ornament, and for decorative purposes might be used with much advantage, and would give variety to many architectural works. In the lower hall of the Museum of Practical Geology, are many examples in illustration of this. In the table-cases will be found cubes of granite from nearly all the districts producing granite in this country. These cubes show the stone in its rough state, dressed, and polished. A pavement of the Aberdeen and Peterhead granite, some pilasters, an enormous vase and pedestal, exhibit the working qualifications of these stones. Pedestals of the more ornamental varieties of the Cornish granite will also claim attention, showing, as they do, the variety of colour and of crystallization which can be obtained; the degree of polish of which these stones are susceptible, and their working capabilities. Granite, in the common and original acceptation of the term, denotes a rock composed of felspar, quartz, and mica. It frequently contains, in addition to these, some other minerals, but they are not *essential* to true granite.

The component minerals of this stone are united together by a confused crystallization, not only mutually penetrating and interfering with each other, but sometimes the small crystals of one are completely enveloped in the large crystals of a different kind of mineral. It is a very common occurrence for one, or even more, of these minerals to be developed in large crystals, in a granular basis of the whole, so as to constitute a porphyritic granite.

Granite has usually been considered as a rock which has been produced, by a process of slow cooling, from a condition of igneous fusion. There are, however, some objections to this

view; and there are certainly some conditions observable which are scarcely reconcilable with the theory which refers this rock to an igneous origin; but this is not a question for consideration at the present time. There are, however, some conditions which deserve more attention than they have received, which appear to bear strongly upon the question of the durability of the stone.

Granite will be found to possess a certain kind of stratification; the quarrymen commonly speak of beds, and they state that considerable differences are observable in the solidity of the different beds. This stone is also jointed, and these joints have almost always, in the same district, the same general line of direction; these lines of natural dislocation in Cornwall and Devonshire frequently agree, very nearly, with magnetic north and south.

There are also lines of cleavage. The cleavage of granite into regular forms, depends on the structure of the rock—this is proved by its only taking place in one direction, which corresponds with its crystalline arrangements. The workmen are well acquainted with this fact, and therefore never attempt to break a rock in a line diagonal thereto. Mr. Enys has collected much useful information on this point. The granite of Penryn is principally composed of two kinds; one is a hard and compact rock, which is extensively worked and shipped for the London market. It runs in parallel ranges, bearing N.E. and S.W., through the other kind, which is of a softer and a coarser texture. The hard granite is cloven into quadrangular blocks; and it has been ascertained by long experience that the cleavage cannot be effected in any direction, but only in three, with any regularity, and that each of these require a different degree of force; thus, if the horizontal cleavage demand a power denoted by two, the perpendicular cleavages, crossing each other, will be in the proportion of three and five; the latter commonly intersects the larger felspar crystals, whilst the former is parallel therewith, and may be termed the longitudinal cleavage. Near Penryn the last mentioned cleavage runs N.N.W. and S.S.E., varying 15° or 20° either way; it generally coincides with one of the vertical natural joints, though in many instances it does not correspond therewith, but crosses them often at an angle of 30° or 40°.

At the Cheesewring the weakest line is found to be that which corresponds with the line of bedding; the next line of cleavage, corresponding with the general range of the felspar crystals, varies from nearly N. and S. to about 35° west of magnetic north.

These facts cannot fail to lead ultimately to some important information, and must determine the lines in which the granite can be most advantageously placed, so as to ensure the greatest amount of durability.

It is not usually thought that granite is much effected by change of temperature; during frost, however, it is worked with difficulty, and the rapidity with which, upon a thaw, it again softens, and becomes *free* before the tool is not a little singular.

Granite, in certain situations, appears liable to decomposition; its felspar crystals giving way, and producing the valuable Kaolin, or China clay, so largely used in our porcelain manufacture. Cornwall, in 1855, produced of this China clay 60,188 tons, worth £51,159; while Devonshire exported 1100 tons. The granite in a semi-state of disintegration, is sold as China stone for glazing porcelain; of this there was exported from Cornwall 19,961 tons, valued at £17,964. Such is an outline sketch of the more interesting facts connected with this most important building stone.

R. HUNT.

SUGGESTIONS OF SUBJECT TO THE STUDENT IN ART.*

BY AN OLD TRAVELLER.

CHAPTER VIII.

Prodilections of the Early Painters—Subjects from Scripture—From the Legends of the Saints—Practice of our own time capable of Amelioration—Rome and her Visitors—The Museo Chiaramonti—The Nuovo Braccio—Statue of Demosthenes—The Sculptor and his Subject—The Stranger on the Hearth—Adrastus the Suppliant—The Lustral Rites are granted—Adrastus at the Chase—Death of Atys—Immolation of the Homicide—Men of Corinth at Petra—The Mother in the Portico—Hesitation of the Envoys—Laba listening—Escape of Cypselus—Fulfilment of the Oracle—Tasso—Idraote and Armida—The Enchantress in the Camp—Instructions—Godfrey before Jerusalem—Clorinda—The Leader wounded—Ariosto—Orlando and the Dead Palfrey—The Paladin and the Peasant—Frithiof—Farewell of the Fathers—Words of Wisdom—Frithiof and Ingehore—Childhood—Youth—The Ocean-bark—The Torrent—Demand of the Bride—Lovers at the Shrine of Balder.

THE earlier schools of painting are reproached with too exclusive an attachment to one class of subjects—those derived from Holy Writ and from the Legends of the Saints, that is to say: nor is the charge without foundation. But, to say nothing, at the present time, of all the many reasons that might be assigned to explain, if not entirely to justify, their choice, might we not more profitably turn our attention to the question, whether we do not ourselves too rarely lift our thoughts to the grand inspiring themes presented by those inexhaustible treasures, more especially by the first-named? For how largely extended are the vistas opening to the sons of Art with every page they turn in the long period of the Hebrew history; and how numerous are the yet more touching episodes offering themselves to their holiest aspirations in the later annals of the New Testament!

Not to every man is it given to tread this high and hallowed ground, you will say, and you are right—the most exalted among you may well feel awe-struck, and pause long before he approach the solemn subjects in question; but for him, the true artist—and to none of inferior character could they be fittingly named—the hour does come when all things are permitted to his research. There are moments when the grandest reveal the most awful of their mysteries to his perception—when the holiest are not too sacred for his reverential gaze. For him it is that the pencil of immortals has been imbued with those hues of heaven, vouchsafed to such as he is, in their purest dreams. Let him accept in all humility the high privilege thus conferred upon him; let him seize the moment, ere the glory of the vision shall become too resplendent for his mortal eyes, and so be lost for the multitudes less favoured, who might else rejoice therein through all coming ages.

We do not now name any special instance of the treasures reserved for the most favoured son of Art in these, the first and richest of his sources; although more than one great task—destined for the noblest only—rise with impressive majesty before us. These are subjects that should be self-inspired—taken as they present themselves, at the rightful moment: they will then emanate, as should be, from the mind awakened to their momentous importance—from the heart enlarged for their reception: firmly shall the priest-like artist then fix his gaze, with power to meet, undazzled, the light ever beaming from those lofty regions wherein his elated imagination shall then have unfolded all the force of her pinions. Thus alone can they be worthily treated; but let him to whom the moment shall be vouchsafed, see that he suffer it not to pass infructuous—let him “work while it is called to-day, for the night cometh wherein no man can work.”

Much has been said, and much written, of the various emotions experienced by such as stand for the first time before the gates of Rome—much and truly; since there are few events, among those of secondary importance in the life of man, better calculated to make a profound impression, than is the first arrival of the traveller in Rome. Yet, with a more effective eloquence, might that speaker expatiate, who should describe the feelings agitating the heart of him who returns for the second, third—nay, tenth or twentieth time, to that true centre of

* For a detailed statement of the total value of our mineral produce, and much information respecting the building stones of the United Kingdom, see “Mineral Statistics of the United Kingdom of Great Britain and Ireland for 1855.” By Robert Hunt, F.R.S. Published by order of the Lords Commissioners of Her Majesty’s Treasury. Longman & Co.

affection for all whose love is given to Art in its highest manifestations.

But, like other feelings deeply seated, these are less frequently insisted on, nor will any attempt to describe them be made here: confining ourselves within narrower limits, we will but ask the *frequent* sojourner in the beloved city, if—even at this broad distance, though seas are rolling and half a world is interposing its diminishing influence between him and the seven hills—his heart do not even now leap in his bosom, as he recalls the passionate eagerness wherewith he hastens to revisit the more immediate objects of his predilection—once those gates are past?

Is not that moment, when these—whatever, among Rome's myriad treasures, may be the chosen—once more stand, revealing their beauties to his gladdened gaze—one long to be remembered, and ever recurred to with new delight? Happy they whose lives can reckon many such! still happier those to whom fair Hope gives promise of yet many to come in the future!—you, who read these words, are for the most part in the last-named category. So much the better; and in your case may the bright-eyed syren prove even fairer than her promise, although to do so be not always her wont.

In that part of the galleries of the Vatican known as the Museo Chiaramonti, in the hall usually called the Nuovo Braccio, and standing on the right of him whose blessed hap it is to pass his hours in that glorious treasure-house; on his right, I say, as he descends the gallery from its entrance in the great corridor of Bramante,* is the one object ever devoutly sought and reverently approached with the first salutations of return, by the present writer—even before the Apollo—nay, even before the Laocoon, which last obtains the second visit. This is a statue of Demosthenes, somewhat larger than life, and obviously produced in the best period of Art's development. With the exception of the hands, and the scroll held by the orator in his right hand, no part of the work has suffered restoration—all beside is of the purest Greek workmanship. The attitude of the figure is noble and dignified; the face is full of thought; the expression is calm and grave; the draperies are simple and graceful; and over the whole is breathed a spirit of repose, investing the presence of this majestic form with a power forbidding the approach of every trivial thought: nay, suffering none save the best and purest feelings to have birth within the space made sacred by that bequest of beauty, wherewith the grand and solemn past hath enriched all future time.

And how gladly would the beholder resign himself to those salutary influences, undisturbed by recollection of the frailties that marred the life of the original! how fain would one believe the statesman and orator as noble in his life as the sculptor has rendered him in his looks! but this may not be. To Art alone do we give all our worship here; for the subject, we have only the wish that we could forget the cowardice marring the soldier; the yet baser corruption that disgraced the statesman. We cannot fail to glorify the fine conception, so happily executed, of the certainly exalted Sculptor—whose name we have not been able to make certain, among the conflicting testimony assigning it to the few that could be supposed capable of its production—but for Demosthenes himself, apart from his power as an orator, to which we can offer nothing better than admiration, the memory supplies few recollections of his career that are not shaded by regrets.†

The statue was discovered in excavations made near the Villa Aldobrandini, at Frascati, and was immediately secured for the sovereign pontiff, then Gregory XVI., who placed it where it now stands. It will one day be removed, without doubt, into some fane, set apart for special objects, as are those well-remembered "Gabinetti," assigned to the Antinous, the Laocoon, the Apollo, and some few others, all dearly familiar to the artist, whose best-loved haunt is the matchless sculpture galleries of the Vatican.

It was while ourselves privileged to listen to the discussion of some few among the lovers of Art who

have most worthily paced those halls of beauty and greatness, that we were made acquainted with designs, never carried beyond the first thought, although well meriting a more extended existence. And who shall say that they may not yet secure such from some young aspirant of the coming times? Let us, at least, lay the subjects before him; and if the student in sculpture or painting shall find any one among them awoken a congenial chord in his bosom, he may, perchance, be tempted to look further into their sources.‡

You have first a youth, or one who has but just attained to manhood, for the authorities do not tell us his exact age; he is seated amidst the ashes of the hearth in a Lydian dwelling.† Covered almost entirely by the robe, wherein, complying with the custom imposed on all in his condition, he has carefully involved his person, you do but see the profile of his face, yet this, no less than his attitude, gives evidence of profound grief and humiliation. The expression is not that of guilt, still less is there any touch of baseness in the aspect, which is indeed both noble and beautiful. The eyes of the mourner are bent on the ground; and beside him, fixed firmly into the earth, is the weapon wherewith it has been his unhappy chance to commit the homicide which compels him thus to seek protection and aid from one powerful enough to shield, and of condition conferring the ability to absolve him from the consequences of his involuntary crime. To that end then is the stranger now seated on the hearth of Cræsus; and it is the King of Lydia, a man of ripe age and imposing figure, whom you see looking gravely on the suppliant, imploring refuge and the rites of expiation at his hands.

And the looks of Cræsus show us that these will not be refused. In reply to the king's inquiry, the afflicted youth has said—

"I am the son of Gordius, and grandson of Minos. My name is Adrastus; unwittingly have I slain my brother. Driven to exile by my father, and left of all, I come here thy suppliant, O king!"

And the king replies—

"You are the child of my friends, and you are come to your friends; abide in my house, where you shall know no want, and bear this calamity as meekly as you may."

The hustral waters are prepared accordingly, with all beside demanded by the ceremonies of expiation;‡ the Furies receive their propitiatory offerings; and these rites accomplished, invocations are duly made to Jove the Expiator, when Adrastus takes up his residence in the palace of the king.

In our second subject we again have the manly and graceful figure of Adrastus, but he is now engaged with Atys, the beloved son of the Lydian king, in chase of a monstrous boar.—Ah! Vellati, how wouldst thou depict him for us, and how would thy Rome, the beloved, rejoice in the work!—a boar that has ravaged the country, and for the destruction whereof Cræsus has reluctantly, and in dread of menacing omens, permitted his son to go forth; but not until he has solemnly confided him to the guardianship of Adrastus, who accepts the charge with upright mind, well resolved to fulfil it at risk of his life.

But who shall alter the decrees of the gods?—the powerful boar-spear, held in watchful readiness for the defence of his companion, has been poised in his vigorous hand, still raised for the act, the weapon has gone, making its own wild music through the air, and now stands quivering in the side, alas! not of the boar, but of that other beautiful youth, the treasured son of his benefactor, the doomed Atys, whom you see falling to earth, and who must die beneath the stroke. Woe! woe! for the unhappy Adrastus; see the sorrow to death that is already gnawing at his heart! He has fulfilled the oracle which had foretold this fate for his son Atys to Cræsus, who had vainly

striven to avert the misfortune by withholding the youth from arms and the chase, until, yielding to his entreaty, he had permitted him to come forth on this fatal morn—and for this! Woe! deep, irremediable woe for Adrastus! Nor will he further seek to struggle with the destiny that oppresses him—pass some few short, fleeting hours, and he too will join the shades below. Self-immolated, he shall fall on the tomb of Atys, and the god, before implacable, shall at length be appeased.

From the same peculiar series of histories, but of widely different character, here follows another of the subjects in question.

Standing beneath the vestibule of a house at Petra, not far removed from the radiant and luxurious, yet withal refined and learned city of Corinth, whose domes may be discerned in the distance, is a company of ten men, to whom and from the house there has advanced a woman: she is not remarkable for beauty, nor in her first youth, but is invested with the interest ever accorded to the character of a mother, and such is the relation she bears to the fair infant whom you see her placing in the arms of the man standing foremost of that company. You cannot doubt this, as you mark the looks of tender love and pride that light up her face as she resigns her treasure to his hands. The woman is Labda, a daughter of the Bacchiadae, "but being halt from birth, no man of her own people would take her to wife;" wherefore her father, Amphion, has bestowed her on the son of Echarras, even Etion, and to him she has borne the son but now confided to the arms of the stranger.

But of this infant the oracle has said:—

"He shall be a lion on your path, O Corinthians! Strong, a devourer of flesh, his power shall relax the joints of many. On these things brood well, ye who dwell around fair Piræne and in frowning Corinth—an eagle in the rocks shall bring him from afar to be your bane."

These men are the envoys of Corinth, sent hither to destroy the son of Etion, and resolving that he who first receives the child shall dash him on the rocks beside the dwelling. But the boy smiles brightly in the face of his intended murderer, and the latter, rendered incapable of his dark design by that sweet aspect, has placed his charge in the hands of the next: disarmed by the innocence of the babe, this man also refrains from doing him injury, and he passes ultimately through the whole of the ambassadors, the tenth delivering him unhurt to the arms of his mother. What follows may supply you with a second picture.

The baffled Corinthians retire to a short distance, but they pause before a second door of the dwelling, and concealed within the shelter of this, Labda—who had first brought her infant forth, supposing the strangers to seek it for the love they bore to its father, but had now become suspicious of their intent—hears then reviling each other for the weakness that all had displayed in sparing the child. Then, fearing they might yet return, she resolves to hide her boy in a bee-hive standing near, or as some authorities have it, in a chest.

The event was as her fears had suggested, the Corinthians came back, but the place of concealment chosen by the mother eluded their search—"The gods had decreed that calamity should arise to Corinth by means of Etion's progeny;" and the men departed to the city whence they had come, determined on reporting to those who had sent them that their errand had been accomplished.

Thus the child lived to fulfil the oracle; he was called Cypselus, from the chest, or beehive, wherein he had lain concealed; and ultimately, as most of you will remember, became the tyrant of that name, by whom Corinth was so cruelly misgoverned during thirty years.

Admirable are the pictures, constantly rising to the eyes of the reader, as he lingers over the noble and graceful stanzas of the "Gerusalemme Liberata." You can open no page wherein they do not abound; how then does it happen that from a book so much read in our country there is yet so little painted? "The Erminia!" you will say—and I remember that Erminia has been made familiar in our galleries; but Rinaldo, but Tancredi, but the pious Godfrey himself—to say nothing of the pagan leaders, all legitimate subjects for painting—have appeared but very rarely on the canvas. Of Olinda and

* So called, as the reader will at once perceive, from that excellent master by whom the magnificent gallery thus named was constructed; and to whom is indeed due very much of the credit, more commonly attributed to Michael Angelo, for other parts of the Vatican and St. Peter's.

† See Becker, "*Demosthenes als Staatsmann und Redner*." Halle, 1816 and 1830.

* The student will find the three next to follow in Herodotus, Hist. book i. 34–45; book v. 92. If he prefer a translation, a faithful and good one may be found in that used by the present writer—to whom the Greek original is unknown—the work of Laurent, namely, translated from the text of Gaisford, vol. i. book i., vol. ii. book v. Oxford, 1846.

† In Homer, "*Odyssey*," vii. 153, we have a remarkable instance of the custom here alluded to. Ulysses, after imploring the assistance of Alcinoüs, seats himself on the ashes of the hearth. See Laurent's Herodotus, *ut supra*, vol. i. 19, note.

‡ See Apollonius Rhodius, "*Argonautics*." Oxford, 1777 or 1779. See also Laurent, *ut supra*.

Sophronia the episode is familiar to all readers, but is not so widely known in our galleries. Neither is the radiant Armida so frequently represented as one might fairly suppose she would be, her wondrous beauty and the power of her fascinations considered. What, for example, could you do better than exhibit her? I will not say when casting her toils around Eustazio, as she threads her way across the crowded camp, nor when she subsequently sets forth her plausible story before the Christian chief himself and his most trusty counsellors, although either occasion might serve your purpose well; let us take her at an earlier period, and show her listening to the lore of the Damascene Idraote, as he prepares her for that enterprise of deception which she ultimately carries out with so much success.

Hear first but some few of the words wherein our author describes this "fairest maid in all the East," as one of Tasso's numerous translators renders his—

"Donna cui di beltà le prime lodi
Concedea l'Oriente."

One stanza shall suffice; nor is even that required for the aid of your imagination, ever ready as she doubtless is to supply all riches for every need:—

"Fa nove crespe l'aura al crin disciolto
Che natura per se riuerspa in onde.
Stassi l'avar sguard, in se raccolto,
E i tesori d'Amore, e i suoi nasconde.
Dolce color di rose in quel bel volto
Fra l'avorio si sparge e si confonde;
Ma nella bocca, ond' esce aura amorosa,
Sola rosseggia, e semplice la rosa."*

The translation that follows is from the work of Captain Alexander Robertson:†—

"The unbound masses of her silken hair
In wavelets, rippled by the breezes float.
Within herself she treasures up with care
Looks freighted with rich stores of amorous thought.
A rosy tint upon her visage fair
With ivory's hue is mingled and inwrought.
But on her lips, whence breathes a rich perfume,
Blushes, unmixed, the simple rose's bloom."

Hear, furthermore, the opening portion of the words addressed to this fair vision by her baleful kinsman—the dark enchanter Idraote; for in them you shall find significant intimations as to the character of beauty wherewith she is to be endowed:—

"Dice: o diletta mia, che sotto biondi
Capelli e fra sì tenere sembianze
Canuto senno e cor virile ascondi,
E già nell'arti mie me stesso avanzo;
Gran pensier volgo, e se tu lui secondi,
Seguiteran gli effetti alle speranze.
Tessi la tela ch'io ti mostro ordita,
Di cauto vecchio cescutrice ardita."

"Vanne al campo nemico: ivi s'impieghi
Ogn'arte femminil eh' amore alletti,
Bagna di pianto e fa melati i preghi;
Tronca e confondi co' sospiri i detti:
Beltà dolente e miserabil pieghi
Al tuo volere i più ostinati petti:
Vela il soverchio ardir con la vergogna,
E fa manto del vero alla menzogna."

"Prendi, s'esser potrà, Goffredo all'esca
De' dolci sguardi e de' bei detti ardenti,
Sì ch' all'uom invaghito omai rincesca
L'incominciata guerra, e la distorni.
Se ciò non puoi, gli altri più grandi adesci:
Menagli in parte ond' alcun mai non torni.
Poi distingue i consigli. Al fin le dice:
Per la fe, per la patria il tutto lice."‡

Thus rendered by Captain Robertson:—

"He said, 'O dearly loved! thy looks are fair,
And thy sweet face seems innocent of guile;
Yet old thy head, and bold thy heart to dare;
And skilled art thou in every virgin wile.
By thy assistance I great plans prepare,
Great ends I hope to gain if fortune smile.
Weave thou the web, as my advice directs,
Boldly perform what timid age projects."

"Go to the hostile camp, and practise there
All arts of woman that to love allure;
Let tears flow freely, speak soft words of prayer,
And mingling sighs with broken words, adjure:
So shall the charms of beauty in despair
By love or pity hardest hearts secure.
Let modesty your darling hopes disguise,
And spread the garb of truth o'er all your lies."

"Endeavour first Goffredo to ensnare
With sweetest smiles by flatteries endeared;
For men who love, from war would fain forbear,
And in war's toils have seldom persevered.
If he resist, some of his chiefs lead where
They may be kept secure, and no more feared.
He other counsels gave; and lastly said,
'All things are right our king and faith that aid.'"

Differing entirely in character, but of equal merit, and equally appropriate to the purposes of the painter, is that passage in the eleventh canto, which describes the assault on the walls of Jerusalem, wherein Godfrey appears in person, and is wounded by Clorinda. First you have the bold and beautiful amazon, her bow, menacingly bent on the Christian assailants, in her hand:—

"E di macchine e d'arme han pieno avanti
Tutto quel muro a cui soggiace il piano:
E quindi, in forma d'orrido gigante,
Dalla cintola in su sorge il Soldano;
Quindi tra' merli il minaccioso Argante
Terreggia, e discoperto è di lontano:
E in su la torre altissima angolare,
Sovra tutti Clorinda ceceala appare."

"A costei la faretra e l'grave incarco
Dell'acuto quadrelli al tergo pende.
Ella già nel'armi ha preso l'arco,
E già lo stral v'ha sulla corda, e l'tende:
E disiosa di ferire, al varco
La bella arciera i suoi nemici attende.
Tal già credea la vergine di Belo
Tra l'alte nubi sacetar dal cielo."*

Rendered by the same translator in the verses that follow:—

"On the north wall there had been stored before
Missiles, and every species of machine;
There, rising like a horrid giant o'er
The wall, was, from the waist, the sultan seen;
There, 'twixt two merlons standing, like a tower,
Far off was seen Argante's threatening mien;
There, on the loftiest tower, where ends the wall,
Was seen Clorinda, far above them all."

"Her quiver, with sharp pointed arrows stored,
Was from her back—a weighty load—suspended.
A shaft she chooses, fits it to the cord,
Already in her hand the bow is bended:
Thus eager to repel her foes abhorred
The lovely archer their approach attended.
So was erewhile the maid of Delos seen,
When from the clouds she showered her arrows keen."

Thus prepared, the fearless amazon receives her enemies; and constantly aiming at some prominent leader, has laid many among the noblest of the Christian captains low: Clothaire, Ademar, the Count of Amboise, and Palamede, have already fallen, when Godfrey himself, advancing towards the tower she thus stubbornly defends, and which now seems tottering to its fall, is wounded by one of those unerring darts. The state of things, as required for your purpose, is described as follows:—

"Così la torre sopra, e più di sotto
L'impetuoso il batte a-pro arrete;
Onde comincia omai forato e rotto;
A discoprir l'interne vie secrete.
Essi non lunge il capitano condotto
Al conquistato e tremulo parete,
Nel suo seudo maggior tutto rinchiuso,
Che rade volte ha di portar in uso;

"E quindi cinto rimirando spia,
E scender vede Solimano abbasso,
E porsi alla difesa ove s'apria
Tra le ruine il periglioso passo;
E rimaner della sublime via
Clorinda in guardia e l'cavalier Circasso.
Così guardava; e già sentiasi il core
Tutto avvampar di generoso ardore."

"Onde rivolto, dice al buon Sigiero
Che gli portava un altro seudo e l'arco:
Ora mi porgi, o fedel mio scudiero,
Cotesto meno assai gravoso incarco;
Che tenerò di trapassar primiero
Su dirupati sassi il dubbio varco:
E tempo è ben, ch'alcuna nobil opra
Della nostra virtute omai si scopra."

"Così, mutato seudo, appena disse;
Quando a lui venne una saetta a volo,
E nella gamba il colse, e la trafisse
Nel più nervoso ov'è più acuto il duolo.
Che di tua man, Clorinda, il colpo uscisse,
La fama il canta, e tuo l'onor n'è solo:
Se questo di servaggio o morte se viva
La tua gente pagana, a te s'ascriva."†

Translated by Captain Robertson in the stanzas that follow:—

"The tower above, still more the ram below,
Battered the wall; this, shaken to its base,
Began, through perforated rents, to show
The paths it screened, and the internal ways;
Godfrey, who thought it near its overthrow,
Approached the wall, its shaken strength surveys,
Completely covered by an ample shield,
One seldom used, which all his form concealed:

"With cautious eyes examining the rent,
He from above saw Soliman descend,
And 'mid the ruins his bold front present,
Resolved the perilous passage to defend.
Clorinda, to protect the battlement,
With the Circassian cavalier remained;
This seeing, he already felt within
A generous heat to fire his heart begin."

"To good Sigiero then, who bore his bow
And a light shield, did Godfrey, turning, say,
'O faithful servant, let me now forgo
This shield for one more light, that so I may
First mount the breach, and to the host first: how
Amid these toppling stones a dubious way:
Full time it is, by some illustrious deed,
My valour should be shown to those I lead.'"

"Scarce had he changed his shield, had uttered scarce
These words, when from the walls a shaft they shoot
Which struck the chief, and deep his leg did pierce
Where nerves abound, and pain is most acute.
By thee, Clorinda,—so does Fame rehearse,—
The wound was given; all the renown impute
To thee alone, that death and servitude
Did, on that day, thy pagan race elude."

No lack of picture for him who revels amid the rich pages of Tasso, as even from these few passages is proved abundantly. Others of the Italian poets present them in almost equal abundance; yet is the writer compelled to admit that in Dante alone will you find matter of equal interest. Many are the striking portraits whereunto we would fain direct your attention in the last-named author; but, for the moment, let us bestow the small space yet remaining to us on another, also much admired by excellent judges, although by no means so well beloved by your poor scribe and servant now in presence.

In the latter part of the twenty-ninth, and the first stanza of the thirtieth canto of his "Orlando Furioso," Ariosto—to whom it is that we refer—describes the following, among other strange vagaries performed by the Paladin in his madness. He has dragged the dead palmy of Angelica* to a broad estuary of the sea, where—

"Gli fu forza il cadavero lusingare,"

says the poet, "he was compelled to leave the carcass," since he can no longer drag it onward. He then crosses the river by swimming, an accomplishment whereiu he is equal to the otter, says Ariosto; and on the shore thus gained, he finds a shepherd mounted on a good horse. To this man Orlando approaches with the following words:—

* See canto xxix., stanza 67, et seq.
† Not being able to obtain one of the accredited translations of Ariosto in time for the present occasion, the writer substitutes the following, in preference to leaving any reader, who may prefer an English rendering to the original, with his desire unfulfilled:—
"Vorrei del tuo roznin, gli disse il matto
Colla giumenta mia far un baratto
"Io te la mostrero di qui, se vuoi;
Che morta la sull'altra riva giace:
La potrai far tu medicar di poi
Altro difetto in lei non mi dispiace
Con qualche aggiunta il roznin dar mi puoi
Smontane in cortesia, perchè mi piace.
Il pastor ride, e senz'altra risposta
Va verso il guado, e dal pazzo si scosta.
"Io voglio il tuo cavallo o! non odi?
Soggiunse Orlando, e con furor si mosse,
Avea un baston con nodi spessi e sodi
Quel pastor ride, e il paladin percosse.
La rabbia e l'ira passò tutti i modi
Del Conte." ‡

This, to him who shall make choice of the subject, is perhaps the most favourable moment for his purpose. Useful studies of muscular action, or of the animal form in death, might perhaps be deduced from the earlier portion of the passage; and the approach of Orlando to the brink of the river might, for those purposes, be judiciously selected as a second subject—but this is a question that may safely be left to the taste and judgment of the student.

Turning from the Ausonian poets, and seeking other climes, let us try whether we may not find

* See canto xxix., stanza 67, et seq.

† Not being able to obtain one of the accredited translations of Ariosto in time for the present occasion, the writer substitutes the following, in preference to leaving any reader, who may prefer an English rendering to the original, with his desire unfulfilled:—

"I want thy wretched horse!" the maniac cried,
"Dismount, and take thou mine—there, on the stream's
far side

She lies, stark dead. Thou'lt cure her at thy leisure;
No other fault she hath. Haste, give me thine,
With aught beside in fair exchange—the measure
I make not too exact—so thou incline
Thy will in duteous haste to do my pleasure.
Give me thy horse, I say, and take thou mine!"
The shepherd hears, then silently rides on
Smiling, and to the water-side is gone.

But after him Orlando. "Halt! ho there!
Dost thou not hear me, man? I want thy horse!"
Then doth the swain his knotted staff prepare
To strike the Paladin.—The raging force
Of that blind fury, words may not declare,
Rushing, as this he saw, with headlong course
Thro' the mad Count's hot breast—he springs to meet
The upraised baud

† Tasso, canto xi., stanza 51, et seq.

something to our purpose in a work, greatly admired at the time when it was first made known to the English public, but which has not attracted much attention from our students in Art, so far as the present writer has been able to ascertain. We allude to the Swedish poem of "Frithiof," the most important production of its author, Esaias Tegner, Bishop of Vexjö, and, in the estimation of his compatriots, the first poet of Sweden.

The tale related is one of true love; but within it—and wherefore should there not?—are interwoven words of eternal wisdom: here, for example, are a few of those uttered by Thorsten Vikingsson to his son Frithiof, the hero of the poem. Let us premise, for the better comprehension of such as do not know the work, that Thorsten is the vowed friend, the "warrior-brother" of King Bele, who has called his own two sons, together with the son of Thorsten, to receive his dying farewell; that part of the ceremony—of which you shall presently have a slight description—concluded, Thorsten speaks, and as follows:—

"Thereafter uprose Vikingsson—he spake in manly tone—
 'It seemeth ill that Bele king must pass away alone;
 We twain have shared the chances of life's adventurous game,
 And time is coming fast, when we may share our death the same.
 "And length of days, son Frithiof, hath told a tale to me,
 And whispered many warnings, which now I give to thee:
 As Odin's black-winged messengers descend upon the tomb,
 So on the lips of aged men there sits the surest doom.
 "First, hold the holy gods in awe—in awe for good and ill,
 Like storm and sunshine come of heaven, and visiting at will.
 The eye of heaven sees the thoughts that dwell within the mind,
 And later days repay the sins of years that lie behind.
 "Thyself shalt die, and all shall die belonging unto thee,
 But one thing mark me, Frithiof, shall live eternally—
 The judgment over dead men; so strive both day and night
 To think the thoughts of noble minds, and do the thing that's right."

Here, you will say, is no picture, and you are right; but preceding these are lines wherein you will find a highly effective one, setting before us all the chief characters of the story—one only excepted, who shall appear in due time. The words are these:—

"King Bele stood in council-hall, he leaned him on his glaive,
 Beside him Thorsten Vikingsson, that Bretwald* bold and brave;
 His aged warrior-brother, a hundred years had he,
 With scars like runes, and hoary hair, so silver white to see.
 "They stood within the presence-hall, their looks were haught and high,
 Were like two ancient heathen shrines, that half in ruins lie;
 "Then Bele king was first to speak—"My days are well-nigh sped,
 The sweetest mead is tasteless now, my helm weighs down my head;
 But even as each earthly bliss is fading into gloom,
 Valhalla seems more bright and clear—I turn me towards the tomb.
 "And hither have I called my sons, and called me also thine,
 That each may hear in heedfulness these latest words of mine;
 That I may speak, admonishing, before those eagles young."
 "So, as the king had bidden them, they entered in the room;
 The first and foremost Helge came—a man of craft and gloom;
 He loved to live with priest and seer, and by their altars stand;
 He came from groves of sacrifice, and blood was on his hand.†
 "And after him came Halfdan, a light-haired youth was he,
 His looks had come of noble blood, yet looked he womanly;
 It seemed as tho' the sword he wore had but been donned in jest,
 He looked like maiden fair, disguised beneath a hero's vest.

* *Bretwald*, or *Bretwalda*—a leader or chief.

† This may serve to show that it was not with the priest of a true religion, the seer of a pure creed, that the darksome Helge loved to dwell. Our author is indeed not the man to intimate disrespect of aught truly venerable, as will become obvious in our further progress.

"The last of all came Frithiof—he wore a garb of blue,
 Was taller by a head's height than the taller of the two;
 He stood between the brethren twain, as day, so calm and bright,
 May stand between the ruddy morn and dark discoloured night."

To these youths, thus assembled, the old monarch addresses words of wisdom, adapting his counsels to the necessities arising from the character of each listener; thus, to the elder he says, remembering his narrow and ascetic fanaticism:—

"The Godheads great, O Helge king, in Disarsala* dwell,
 But not as snails or limpets do, in close and shut-up shell;
 As far as day's glad light may shine, as far as sound may fly,
 As far as thought may wing itself, are Godheads great and high."

And further, referring to the harshness and cruelty which subsequently appeared in the character of the elder son, he says:—

"Be not too stern, O Helge king, yet ready to defend;
 The swords that be the best to bite, are aye the best to bend."

with much beside to the same purpose.

To the lightness of his younger child the wise parent applies an exhortation to more earnestness of purpose, in the lines that follow:—

"O Halfdan, mark! a joyful mind is e'er a joyful thing,
 But levity befiteth none, and least of all a king;
 With hops and honey, well combined, the hydromel is made,
 Put greatness in thy sports, my son, put steel into thy blade."

The old men die, and the young men enter on their inheritance, of which, in Frithiof's case, a somewhat minute description is given; but we are seeking pictures, and must not be delayed. Here is one that shall bring our heroine into presence:—

"In Hilding's hut, and Norway's elme,
 Grew two sweet plants, in perfect prime;
 And ne'er before were fairer given
 To smile on earth, or gaze at heaven."

"There grew the sturdiest of them,
 Like sapling oak with spear-shaped stem,
 Whose crest, as e'en a helmet's glancing,
 Wooded each wild wind to keep it dancing."

"And one was like a rose:—the day
 That Christmas chills have passed away,
 And spring, within its burning bosom,
 Dreams of its fast unfolding blossom."

"I say they grew towards flowers and fruit,
 And Frithiof was the sapling shoot,
 And Ingeborg the rose that vied it,
 The lovely rose that blushed beside it."

"Who sees the pair while sunbeams shine,
 May deem himself in Freya's† shrine,
 Where urchin Loves be deftly going,
 With wings of light and tresses flowing."

"Who sees them with the pale moonlight,
 To lead their dancing steps aright,
 May deem there trips it light and airy
 The Elfin King and Queen of Faery."

"What Frithiof learned the day before
 He taught the next to Ingeborg;
 And proud was he when Bele's daughter
 Had learned the runes that Frithiof taught her."

Here have you choice of season and occupation—sunshine or moonbeam; the light sports of childhood, or labour—light as they, with beauty in each and all: the painter has mistaken his vocation if he do not long to reproduce every fair moment so charmingly depicted by the poet. Two more delicious scenes for him whose love is for the ocean or the gladsome river, and then we pass on:—

"If long and late they sat afloat
 On dark blue sea, in rudest boat,
 It pleased her, as the sail was filling,
 To clap her hands and help its swelling."

Or again, and think only what the fiords and streams of Norway give you as the site of what follows!—

"The last of all came Frithiof—he wore a garb of blue,
 Was taller by a head's height than the taller of the two;
 He stood between the brethren twain, as day, so calm and bright,
 May stand between the ruddy morn and dark discoloured night."

* *Disarsala*—the Hall of the Gods.
 † *Freya*—the Scandinavian Venus. See Latham's "Frithiof," notes, p. 199.

"When floods were deep and streams were hoarse,
 He bore his tender charge across,
 Pleased if the currents lashed around him,
 And her small arms the tightlier bound him."

Oh for your genius, sons of blessedness that ye are! all true artists. Would that your power had been the appanage of this your scribe! what galleries would not then be mine to wander through in joy perpetual! But no, for me they may but stretch their clustering columns in the light that imagination lends them; to you alone belongs the magnificent destiny of realising what for the common world is but a more radiant manner of dream.

And so be it! Do you but work for us only; suffer not that all our aspirations return unsatisfied to earth: give to a life of ages on your canvas, if it be but a portion of the good and beautiful that we cannot else retain beyond the fleeting moment, and your hearts shall rest content therewith, no less than our own.

But our Frithiof!

Yes; he is not forgotten. You next have him standing before the brothers who have succeeded to Bele's throne: he is there to demand the daughter of Bele, promised by her father. Hear some few of the words he addresses to Helge and Halfdan:—

"Chieftains, he said, 'the royal maid
 Is very dear to me,
 And here I come to claim her home,
 A lovely bride is she;
 On Bele's laws I plead my cause,
 He wished such match to be."

More follows, but this shall suffice. His Ingeborg is refused to him, and he departs in anger, uttering words of defiance. An aged suitor, King Ring, then demands her hand; but he too is rejected, and Ingeborg is sent for safety to the shrine of Balder, where she is visited by Frithiof. For a description of that "Meeting," I refer you to the poem;* but in consequence thereof Helge subsequently accuses Frithiof of sacrilege. The surrounding warriors urge the hero to deny the charge, which they believe to be false:—

"Frithiof, say No! and Ingeborg is thine!"

they exclaim, but Frithiof replies:—

"No hope or fear can be
 In earth or heaven to wring one lie from me:
 I saw thy sister, Helge. Eye was come,
 'Twas then we met, and under Balder's dome;
 But not in sacrilege or sin—unless
 The simple meeting shook his holiness."

The warriors now all shrink from his side as from a thing accursed. Helge imposes what he believes to be an impossible task by way of penance, and Frithiof retires in rage and despair. He then repairs once more to the shrine of Balder, where he relates what has occurred, to his Ingeborg, whom he implores to join her fortunes to his own at once. Unconvinced by the many causes assigned by Ingeborg for her refusal, Frithiof is then leaving her in "high disdain:"—

"He cursed himself, for that he strove to move
 So much of prudence and so little love.
 Then from his lips these savage accents fell,
 'Farewell, King Helge's sister, fare thee well!'"

But not so can his hapless betrothed endure to see him part; her words arrest his steps:—

"Oh, Frithiof! Frithiof! must we part us so?
 Hast thou no kindlier look before we go?
 No softer word to soothe the soul's unrest
 Of that fond maiden who hath loved thee best?
 Dearest thou I lie on roses, and can see
 My life's whole hope departing smilingly;
 And lightly tear from an unbleeding heart
 What grew with it, and never dwelt apart?"†

These gentle entreaties, with more of similar import, prevail. Frithiof acknowledges the power of the Norns, or Destinies, and they separate; he to attempt the achievement of the task imposed by Helge, his Ingeborg to become eventually the prize of the aged, yet brave and noble warrior, who obtains her from her brothers "by his spear and his bow." Here for the present we must leave them, but may possibly recur to the subject.

BRITISH ARTISTS: THEIR STYLE AND CHARACTER.

WITH ENGRAVED ILLUSTRATIONS.

No. XVIII.—JAMES DUFFIELD HARDING.

HERE we requested to point out the British artist whose talents have been most usefully exerted for the good of his profession, and for the benefit of that large portion of the community to whom Art is in any degree interesting, we should, without the least hesitation, name Harding. We care not to ask whether he is entitled or not to take his place among the great landscape-painters the country has produced—this must be matter of opinion after all; our own is decided; but we maintain that the most distinguished artist that has appeared in our school, if his reputation depended alone upon the application of his talents to the good of others, deserves a less honourable position than Harding. Landscape-painting within the last quarter of a century has, in England, undergone a remarkable change,—a comparison of the works of this period with those of the preceding cannot fail to convince any of the fact; and, by a careful examination of the former, we may easily trace this change to the influence of Harding's example. His style of composition, arrangement of materials, the forms and character of his foliage, the drawing and grouping of his figures, his distribution of light and shade, are more or less apparent in

the works of many of our most popular artists. We do not presume to say they are copyists, but we believe his writings and his drawings have been

so carefully studied, and have left so strong and favourable an impression on the mind, that his contemporaries have insensibly, perhaps, become imbued with his principles of Art, and have carried them out in their own practice, but in a style and manner peculiar to each individually—that is to say, in harmony with each one's perception of nature.

And if we pass from the professional artist to the amateur this influence is still more strikingly obvious. Harding's published works on Art have long been text-books wherever the lead pencil is applied to the purposes of drawing, and men can read the English language—and even where the majority cannot; for his books are to be seen in almost every Art-repository of repute in Europe, in British India, and in America; wherever the study of Art is now made an essential feature of education, they are, we believe, the standard books of instruction. Instances are within our own knowledge of individuals who have become really excellent landscape-painters from the study of his written and illustrated lessons without any other instructor. As a teacher, either by his published precepts or by his personal superintendence, his name stands in the highest rank for the success of those who have resorted to his studio, or have had recourse to his various Art-publications.

In this matter of Art-instruction Harding has shown himself possessed of a capacity to which few painters, by comparison, can lay claim. A man may be a very clever artist without having the faculty of imparting his knowledge to another; and, on the other hand, he may have a thorough acquaintance with the principles of Art, and be able to initiate his pupils as thoroughly into them, and yet may himself be but an indifferent artist. We have frequently met with such characters, and but very rarely with those who, like Harding, can use the pencil and the pen with an equal degree of skill, so that the judgment is enlightened, and the mind instructed, while the eye and the taste are gratified.

The writer of these biographical sketches is indebted to the works of Mr. Harding for whatever amount of knowledge he has acquired in the principles and practice of Art; and from the various conversations—for *we*, to resume our editorial personality, have had the pleasure of his acquaintance many years—it has been our privilege to hold with him, we have gained much information concerning his career as an artist, and the feelings that actuated him to pursue his

Engraved by]

[Mason Jackson.

profession in a way so honourable to himself and so beneficial to others. No man interested in Art can be in Mr. Harding's company without *learning*—not merely *hearing*—something about it.

James Duffield Harding was born at Deptford, in Kent, in 1798. His father, a pupil of Paul Sandby, was an artist in excellent repute as a teacher, and was desirous of educating his son for the same profession, to which the latter was by no means disinclined. The youth at once began to study perspective with great earnestness; but finding that even a very considerable knowledge of the science did not advance him one step in pictorial expression, or what is properly called Art, he had recourse to the soft ground etchings by Prout, which at that period were held in high estimation by students of drawing. These he copied eagerly; and when he had reached the age of fifteen he received a few lessons in colour-

ing from Prout—that is, he saw the latter make two or three drawings, learned the pigments he used, and how to mix them. Harding now thought he would try his hand at sketching from nature, but soon found he dare not attempt anything beyond an old building, such as he had seen Prout draw. A tree with its foliage was a mystery he could not penetrate: everything he did at this time was, as we have heard him remark, *à la Prout*. He began to despair of ever getting beyond a dilapidated cottage, a ruined tower, or some other picturesque bit of architecture; but there was at home a wise and loving counsellor, whose advice and encouragement he felt it his duty no less than his pleasure to follow. His mother asked him one day, when she saw him drawing some old building, “Why trees, and skies, and hills, God's handiwork, were not as worthy of his time and attention as the objects of man's production seemed to be?” The hint

was immediately taken; he unhesitatingly devoted himself to the study of the works of nature, for which he had favourable opportunities, as he was then residing near Greenwich Park. Seated before some one or other of the noble chesnut, elm, or fir-trees which ornament the park, he passed many an hour with his pencil in hand, labouring diligently, yet almost broken in spirit at never finding on his paper aught that in a remote degree resembled the original object. Again he resigned all hope of becoming an artist, for at that time difficulties beset the learner of which the student of the present day knows nothing. Few, if any, examples were within his reach; no works of instruction worthy of the name could be purchased; no knowledge of principles obtained. Harding resolved in his extremity to abandon the pursuit of painting, and attempt engraving, and was accordingly placed by his father under Mr. Charles Pye, with whom he remained for a year.

But the yearning to be a painter was yet strong, and he could not withstand the temptation of recurring to his colour-box and pencils whenever he had leisure. He had been taught the then prevailing fashion of first washing over the paper on which the drawing was to be made with what was called a "harmonising tint," composed of light red and gamboge, or yellow ochre: this was always done without the slightest reference to the contemplated effect, or time of day,—if, indeed, such matters then obtained more than a momentary consideration. The primary operation effected, every object in

the sketch was coloured in a grey tint, made of Indian-red and indigo, except the brightest parts; and when various colours had been washed over each object as were respectively adapted to each, the drawing was considered to be finished. Now it occurred to Harding, as he was pondering over this unsatisfactory method of imitating nature, that this grey was employed to represent shade and shadow, and their modifications by the atmosphere. "Why then," he asked himself, "should the colour be placed over the grey, when in nature the shades and shadows and the air lie over the objects, and therefore between them and the eye? Here is a system the very reverse of nature adopted as a means of imitating her." He took the hint with which his observation of nature had furnished him, reversed his operations by using the local colours first, and the greys over them, and was so satisfied with the result as to follow with a good heart his "first love."

When Mr. Pye removed from London to Upton, near Windsor, he was very desirous to take his young pupil with him, but all entreaty was useless,—the latter had overcome one grand obstacle to his becoming a painter, and, moreover, had always regarded engraving as a painful drudgery; so he left it, and once more turned his face towards perspective, which now wore a pleasanter aspect than formerly, as it afforded him profitable employment among architects: from these engagements he gained a knowledge and love of architecture, which has ever since been of great value to him. But the natural craving of

Engraved by]

BERNSTEIN, ON THE MOSELLE.

[Massey J. J. J. J.]

his unsatisfied desires for higher things rendered this occupation irksome, and as he had frequent opportunities of lucrative engagements in the way of teaching, he accepted them; in a short time, to adopt his own expression, he "gained money and misery," for he found the teacher required to be taught. He could place before his pupils an example, could point out to them when and where the copy was like the original, or differed from it, but knew not how to answer the question frequently put to him,—“Why should I do this?” he had no answer to give: his only reply was to direct the ruler to the vanishing points of the object. He felt keenly the humiliation of being unable to instruct the *reason*.

At the age of eighteen Harding gained a silver medal from the Society of Arts for a water-coloured drawing; his visits to Greenwich Park were still continued, where a constant study of the works of nature enabled him to discover those laws of her operations he had so long looked for: he could now reason on what he did, and could give a reason for what he did. It was not very long after the period of which we are writing that lithography first made its appearance in England, and promised to become an art. He soon saw its capabilities, and attached himself to it—the more eagerly as it gave constant occasion for the employment of his pencil, and he was perfectly satisfied no one could become a painter who was not a skilful draughtsman. So thoroughly

had this conviction impressed his mind that he continued to draw unceasingly till about 1830, rarely producing during the whole of this time more than one water-colour picture in the year: yet he found that whatever he could accomplish with his pencil or chalk, he could with equal power produce with the brush; and as evidence of this fact he had already established himself among his compeers by several admirable water-colour pictures, as “The Corsair’s Isle,” “Modern Greece,” “Byron’s Dream,” and other subjects from the writings of the noble poet: some of these have been engraved on a scale of considerable size. Previously, however, to their production, he was elected a member of the old Society of Water-Colour Painters, his admission being gained by a drawing chiefly of foliage. Soon after his election, the late Mr. Robson, one of the oldest members of the society, called on Harding to congratulate him on his election, and to compliment him on the probationary drawing he had sent in. Robson took occasion, on this visit, to urge upon his young friend the advisability of his “sticking to trees,” and also recommended him to aim at suppressing a “power of execution” which, if not relinquished, would ruin him as an artist. Advice from such a quarter—for Robson was then in the zenith of his popularity—could scarcely be unheeded with impunity, yet it greatly troubled him to whom it was offered; again and again he looked at nature, pondering over the reasons on which he had based

his mode of execution, and at length feeling satisfied that he had the authority of nature for what he did, made his election as to which should have his respectful submission, nature or Robson, wisely chose the former, and continued the career he had begun. Yet alarmed lest circumstances and his own inclination might compel him to "stick to trees," he sought out other subjects, and visited France and Italy to procure such as he considered suitable for the *Landscape Annual*.

About this time impressions of some of his lithographic drawings found

their way to Paris, and were on two occasions exhibited at the Louvre; as an acknowledgment of their merits, Harding received from the *Académie des Beaux Arts* two gold medals, one of a very large size.

Simultaneously with the study of foliage he acquired a knowledge of the laws of nature with regard to shades and shadows; and being convinced of their truth, and, by experience, of their value, he placed in the hands of the public his work on "Elementary Art," as the result of what he had himself learned. This knowledge had undoubtedly been purchased by much toil, which

[Mason Jackson.

he was desirous others should be spared, for no portion of such instruction was elsewhere to be found: that it has done good service thousands can now testify.

In 1836, Harding produced his "Sketches at Home and Abroad," in which was exhibited for the first time the appearance of chalk drawings done on tinted paper, and touched with white. The work gave an extraordinary impetus to lithography, for it was very soon followed by similar publications from drawings

by Stanfield, Roberts, Nash, &c. &c. The "Sketches" were dedicated by permission to the then reigning monarch of France, Louis Philippe, who, to mark his approval of the artist's labours, ordered a splendid breakfast service of Sèvres china to be forwarded to him; but an accident befalling one of the principal pieces, the king sent him instead, through the hands of Count Sebastiani, a magnificent diamond ring, with an autograph letter—a well-earned compliment to the artist's talents and industry.

He now practised painting in water-colours almost exclusively until 1842, when he set earnestly to work to prove again, by painting in oil-colours, the reality of his knowledge; for as a thorough acquaintance with mathematical science will make a man indifferent to what he applies it, and skilful in all, so a true knowledge of Art must render an artist comparatively indifferent to the materials he employs: the difficulties are not in the instruments, but in the acquisition of the knowledge which can alone direct their use. While painting on his canvas and paper, he continued to put forth at intervals various works and lithographies which, as we have before intimated, have spread universally, and found their way not only into the hands of those who regard Art as a part of education, but of those who make it the pursuit of their lives. It is quite needless that we should enumerate these artistic publications, or point out the ability and knowledge displayed in them; the world—not the British people only—knows them well, for there is scarcely a school-room, private or public, or an artist's studio, where they are not found; Art, at home and abroad, has, through their influence and teachings, become better known, appreciated, and encouraged. From all parts of his own country—as well as from every foreign land into which they have penetrated—Harding has received the most flattering acknowledgments and thanks; they have done as much—more we might assuredly say—to make English Art recognised and

respected abroad, than the finest oil-picture ever painted in Great Britain. The works of Feroggio of Paris, and of Calame of Geneva, manifest the influence of Harding's labours.

Our observations on the works of this artist have been principally directed to those he has published, because his fame—and it will be an enduring one—has largely arisen from these. But we are not, therefore, to suppose that his painting in oils and in water-colours entitle him any the less to a distinguished place in the roll of British artists. The Royal Academy, and the gallery in Pall Mall East, have shown abundant proofs that the brush is in his hands as powerful an instrument to produce the picturesque and the beautiful as a piece of chalk or a lead pencil. One scarcely knows in what class of subject to find him most "at home;" whether in the forest, the rural lane, the village common, or by the sea-shore of his own land,—whether in the mountains of Switzerland, the frowning fortresses of Germany, the villas and campagnas of Italy, or the mediæval architecture of continental towns and cities, he makes them all his own—so that it may be truly affirmed he is equally successful in the delineation of all. There is, however, one characteristic of his talent as a landscape-painter which we may almost call peculiar to himself, and that is, the admirable drawing, expression, and 'placing' of his figures,—they are always where they should be, and as they

Engraved by]

THE RETURN FROM MILKING.

[R. Mason del.]

should be. We have heard him say he has studied the anatomy of the human form with as much care and attention as he ever did the forms of foliage and plants.

A question has frequently been asked of us, one too we have often put to ourselves,—“How is it Harding is not in the Royal Academy?” but we have never yet been able to offer a satisfactory solution of the query. Whatever influences may have been at work to withhold from him a position he has more than won,—yet in his case especially a place among the members would be nothing more than honorary,—they are certainly “strange and unnatural.” Not one, we presume, of the privileged “forty” would, if asked pointedly, declare him other than fully worthy to be their associate, and yet they have never done him the justice to elect him. The Royal Academy is, undoubtedly, a body of very clever artists; but as certainly it is not a body wise in its generation or politic. If the Academy is what it ought and professes to be—the chief Art-school of the nation, how is it that artist has been passed over who, beyond all others, has laboured to teach the world what Nature is, and then to try what Art is—the artist whose works, we know, are earnestly studied by the pupils of the Academy? and who, in imparting information, has presented a test by which the merits of his own works could be tried—who has sought to teach the artist “to study not alone what the object is as he sees it *externally*, but what it is to himself *internally*, and what it must be to others”—who has worked to place Art among the pursuits of the intellectual

faculties, and not of the mere fancy. It is not to say too much to assert that, by means of Harding's instructions, thousands now admire Art who would otherwise have been indifferent to it; and because their admiration is based on knowledge, it is lasting, and is given to Art worthy of the nation, whilst it is not subject to the capricious changes of ignorance, or, what is the same thing, of fashion. Moreover, he is in the true sense of the word a gentleman, a man of enlarged and progressive views, energetic, and in every way capable of originating and carrying out measures by which the Art-talent of the country may be more widely developed, and made more extensively useful, both to the artist and the public. We wonder if any of these qualifications are barriers to his admission within the corporation that reigns supreme in Trafalgar Square—if the admixture of such ingredients into the quiet conclave would disturb the equanimity of those who rest so contentedly and unmoved under the shadows of the Academic retreat? Such an opinion prevails, we know, very generally outside its walls; as does also another, that his exclusion is not the way to advance the Arts of the country. Within the last month he has been re-elected, without a dissentient voice, into the Society of Water-Colour Painters, of which he had so long been a member; the rules of the Royal Academy absurdly requiring that any one who seeks admission therein should withdraw from whatever other institution to which he may belong. Of course, Harding thinks he has now knocked long enough at the doors in Trafalgar Square, as he has withdrawn his name from the list of candidates.

ELEMENTARY INSTRUCTION IN DRAWING.*

THERE is an opinion to a certain extent prevailing, and by no means among narrow-minded and illiberal persons exclusively, that the endeavours which almost on every side are being made at the present time to instruct the lower classes, and release them from the bondage of ignorance, must ultimately have a pernicious rather than a beneficial influence. The argument generally used by the opponents of education is, that we are giving to the children of the poor thoughts and ideas tending to make them discontented with the condition in which Providence has placed them; that education excites hopes and aspirations which never can be realised except in a very few instances; that, inasmuch as it is ordained the "poor shall never cease out of the land"—that there must always be "hewers of wood and drawers of water," it is worse than folly to attempt to make anything else of them. We are quite willing to admit that in this, as on all other controversial questions, much may be said on both sides. There is no denying the fact that knowledge is not always power, and also that it very frequently generates

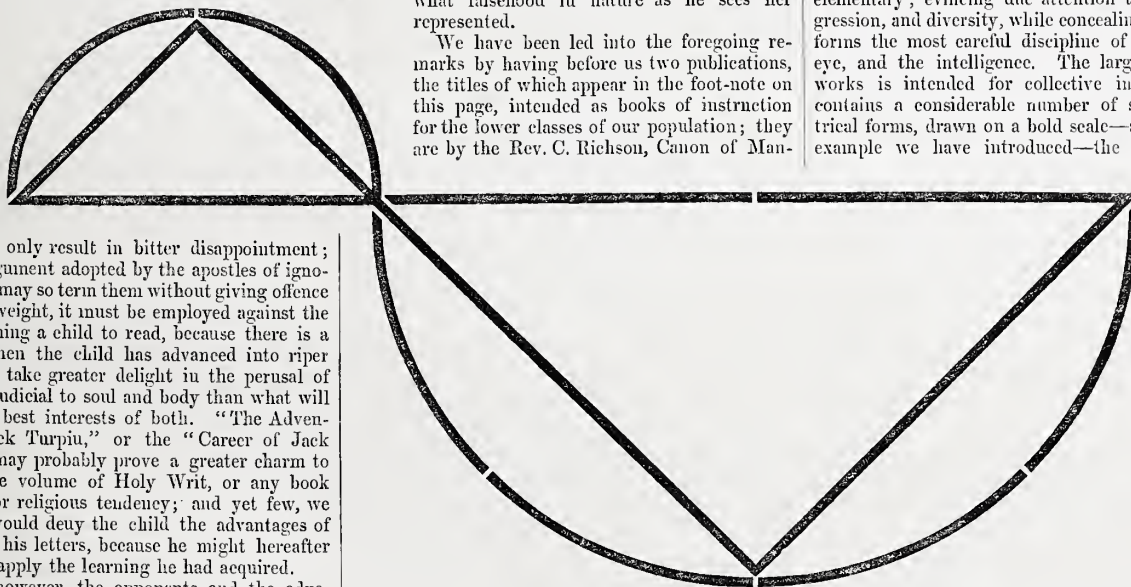

tion is to call up a race of would-be artists, whose legitimate sphere is the factory, the workshop, or the field; and, in support of their theories, they point to the large number of indifferent pictures on the walls of some of our exhibition rooms, the productions of men who would have gained a better livelihood had they followed some trade or handicraft instead of the Arts. This is no doubt true to some extent; but we believe the good far outweighs the evil, and that to teach the elements of drawing is to lay the foundation of superior skill and intelligence in the artisan, and to instil ideas of the true and the beautiful into the minds of all. No man will make a worse mechanic because he has been taught the principles of the Mechanical Arts,—and the instruction to which we refer rarely goes beyond this,—neither will the furrows of the ploughshare be less true, because the hand that guided it may perchance have learned in early years the art of drawing the outline of a barn-door or a cottage window. And while speaking on this subject, we would incidentally remark that there is abundant evidence of the interest felt by the lower classes, generally, in all Art-matters, as well as of increasing knowledge of them; we do not mean to infer that the mechanic or the artisan has yet attained the position of a true Art-critic, but he is fast learning what is truth and what falsehood in nature as he sees her represented.

We have been led into the foregoing remarks by having before us two publications, the titles of which appear in the foot-note on this page, intended as books of instruction for the lower classes of our population; they are by the Rev. C. Richson, Canon of Man-

chester, who has devoted, during several years, a large portion of the time he could spare from his ecclesiastical duties to the preparation of these and other elementary works of an educational character. We always rejoice to see the clergy occupying a prominent position—and a prominent position is their legitimate sphere of action—wherever instruction is to be conveyed; and especially are we pleased to find them advocating a knowledge of Art. Some observations on this subject made by a clergyman, the Rev. J. B. Dickson, at the annual meeting, in June last, of the Paisley School of Design, struck us very forcibly when we read them; he said:—"I am a lover of the Fine Arts, and especially because I am a clergyman. I feel that there is a debt lying upon the clergyman of our day to come forward much more frequently and commonly than they have yet done, to express their profound sympathy with the educational movement now abroad in reference to the young. It appears to me highly impolitic, as well as unmanly, in the clergy to stand back and withhold their influence in the struggles of the people of the land to secure for themselves a thorough education. The time has gone by when we could exhibit one set of opinions in private and another in public; when as clergymen we could appear with a stiff, formal demeanour in public, an unnatural demeanour, and in our own private study or drawing-room exhibit all the ease and elegance characteristic of the well-educated clergyman. It is this feeling, that the time has gone by for holding and acting upon two sets of opinions, which has induced me to come forward so frequently to express what I think on the great subjects occupying the public mind. I believe that if clergymen are to maintain the influence

which they ought to possess, they must come forward and exhibit to the world boldly and frequently their whole mind, their whole heart. If the people take a deep interest in literature, philosophy, science, and the Fine Arts, the people will look to the clergy to sympathise with them. They will ask, 'Does he know anything of the Fine Arts? what does he think of the great writers? what does he know of the great painters whose works shall live for ever?' If a clergyman does love literature, and if he does love the Arts, and if he does not declare that he loves them, he is untrue to himself and false to the people. If ministers of the gospel are to exercise a mighty influence in these strange times—if they are 'to give their form and pressure to the age,' they must conceal nothing, they must fully and boldly tell them what they think on the subjects of every-day interest, and then the people will listen to them more attentively when they speak on the subject of religion."

It is evident that Canon Richson coincides with this opinion, and he acts upon it by employing a portion of his time, and a portion also of his means—for his books are published at a price to exclude all hope of pecuniary profit—in practically supporting his views. The two publications we have before us require but little explanation. They are founded upon principles strictly philosophical, although quite elementary; evincing due attention to system, progression, and diversity, while concealing under varied forms the most careful discipline of the hand, the eye, and the intelligence. The larger of the two works is intended for collective instruction, and contains a considerable number of simple geometrical forms, drawn on a bold scale—as seen in the example we have introduced—the peculiarity of

hopes which only result in bitter disappointment; but if the argument adopted by the apostles of ignorance—if we may so term them without giving offence—be of any weight, it must be employed against the duty of teaching a child to read, because there is a possibility when the child has advanced into riper years he will take greater delight in the perusal of what is prejudicial to soul and body than what will promote the best interests of both. "The Adventures of Dick Turpin," or the "Career of Jack Sheppard," may probably prove a greater charm to him than the volume of Holy Writ, or any book of a moral or religious tendency; and yet few, we apprehend, would deny the child the advantages of being taught his letters, because he might hereafter abuse or misapply the learning he had acquired.

Leaving, however, the opponents and the advocates of education to discuss the matter as they please, it is quite clear that in the present day the work of instruction must go on—it would be as useless to attempt to arrest the progress of the sun towards his meridian, or the ebb and flow of the ocean, as to erect a barrier against the march of the schoolmaster. Whether friend or enemy to the social, moral, and religious economy of the country, he must and will find admittance throughout the length and breadth of the land. It is therefore the duty of all in a position to control his movements, and exercise an influence over his actions, to see that they are rightly directed—to watch the course of education, lest a false step should defeat the object which ought to be the end and aim of all instruction—the welfare and happiness of our fellow-creatures, both in this life and the next.

Now if education in the abstract admits of argument, certainly the propriety of teaching the rudiments of drawing as part of a system of instruction to the poor may fairly be questioned; and it is questioned—by many lovers of Art too, for whose opinions and judgment on most matters we entertain the greatest respect. They assert that such instruc-

tion is to call up a race of would-be artists, whose legitimate sphere is the factory, the workshop, or the field; and, in support of their theories, they point to the large number of indifferent pictures on the walls of some of our exhibition rooms, the productions of men who would have gained a better livelihood had they followed some trade or handicraft instead of the Arts. This is no doubt true to some extent; but we believe the good far outweighs the evil, and that to teach the elements of drawing is to lay the foundation of superior skill and intelligence in the artisan, and to instil ideas of the true and the beautiful into the minds of all. No man will make a worse mechanic because he has been taught the principles of the Mechanical Arts,—and the instruction to which we refer rarely goes beyond this,—neither will the furrows of the ploughshare be less true, because the hand that guided it may perchance have learned in early years the art of drawing the outline of a barn-door or a cottage window. And while speaking on this subject, we would incidentally remark that there is abundant evidence of the interest felt by the lower classes, generally, in all Art-matters, as well as of increasing knowledge of them; we do not mean to infer that the mechanic or the artisan has yet attained the position of a true Art-critic, but he is fast learning what is truth and what falsehood in nature as he sees her represented.

We have been led into the foregoing remarks by having before us two publications, the titles of which appear in the foot-note on this page, intended as books of instruction for the lower classes of our population; they are by the Rev. C. Richson, Canon of Man-

chester, who has devoted, during several years, a large portion of the time he could spare from his ecclesiastical duties to the preparation of these and other elementary works of an educational character. We always rejoice to see the clergy occupying a prominent position—and a prominent position is their legitimate sphere of action—wherever instruction is to be conveyed; and especially are we pleased to find them advocating a knowledge of Art. Some observations on this subject made by a clergyman, the Rev. J. B. Dickson, at the annual meeting, in June last, of the Paisley School of Design, struck us very forcibly when we read them; he said:—"I am a lover of the Fine Arts, and especially because I am a clergyman. I feel that there is a debt lying upon the clergyman of our day to come forward much more frequently and commonly than they have yet done, to express their profound sympathy with the educational movement now abroad in reference to the young. It appears to me highly impolitic, as well as unmanly, in the clergy to stand back and withhold their influence in the struggles of the people of the land to secure for themselves a thorough education. The time has gone by when we could exhibit one set of opinions in private and another in public; when as clergymen we could appear with a stiff, formal demeanour in public, an unnatural demeanour, and in our own private study or drawing-room exhibit all the ease and elegance characteristic of the well-educated clergyman. It is this feeling, that the time has gone by for holding and acting upon two sets of opinions, which has induced me to come forward so frequently to express what I think on the great subjects occupying the public mind. I believe that if clergymen are to maintain the influence

which is that the lines and curves are broken at regular intervals, or with as much regularity as the figure will admit of, to help the pupil in acquiring precision of hand and correctness of line. Instructions for the drawing of the figure are given under each diagram. In the second book, consisting of five parts, the geometrical forms are combined with familiar objects, illustrating and applying the geometrical exercises previously learned. These are intended as *examples* for the pupil to copy, as the "DIAGRAMS" are for facilitating the instructions of the teacher. Accordingly, we have here something like a repetition of the larger work, drawn on a smaller and less bold scale, but accompanied with familiar objects various in kind, represented respectively by straight lines and curved, and by a combination of both—so that a pupil, having once acquired the art of drawing such lines, will find little difficulty in applying them to any ordinary object he may desire to sketch. Perhaps the greatest novelty in this series of examples is the use of lines indicating heraldic colours as preliminary exercises for *shading*. Mr. Richson's plan is exceedingly simple, and therefore just what is wanted for those he desires to benefit. Moreover, the extreme accuracy of all the figures, and the beauty of some, are matters for strong recommendation; while the prices at which they are published respectively—about 40 examples in the primary book of instruction for fifteen pence, and in the other upwards of 120 for half-a-crown—and their being entered on the RECOMMENDED LIST of the "DEPARTMENT OF SCIENCE AND ART," whereby they may be obtained in the form of *grants* at very reduced prices, constitute them emphatically *Elementary Drawing-books for the humbler classes*.

* DIAGRAMS AND INSTRUCTIONS FOR FREE-HAND EXERCISES IN GEOMETRICAL FORMS, to be used in the Collective Teaching of Elementary Linear Drawing. By the Rev. C. RICHSON, M.A., Canon of Manchester. With Prefaces by G. WALLIS and J. A. HAMMERSLEY. London: Depository of the National Society, Sanctuary, Westminster; Chapman & Hall; Darton & Co.—A COMPLETE AND SYSTEMATIC COURSE OF ELEMENTARY FREE-HAND DRAWING COPIES. By the Rev. C. RICHSON, M.A. With Introductory Observations by J. A. HAMMERSLEY and G. WALLIS. London: Chapman & Hall, Darton & Co., and Depository of the National Society.

A FEW WORDS*

ON EXHIBITIONS AND HANGERS—EARL STANHOPE'S BRITISH WORTHIES—GOVERNMENT PATRONAGE—PICTURE DEALERS AND PICTURE PRICES—MR. RUSKIN AND PRE-RAFFAELISM.

Present—STUDENS and AMICUS.

Studens.—I am "Magister" no longer—a visit to the Academy Exhibition is enough to humble any contributor, and is a cure as efficient for professional conceit as a photograph for personal.

Amicus.—Do you then think your work ill-placed? It is on the line, and I thought it looked very well. Not so well, of course, as in your own room by itself; and smaller; but—

Studens.—Yes, smaller in every way; not only in size, but in drawing, painting, chiaro-oscuro—even in conception. All the poetry, if it ever had any, is knocked out of it.

Amicus.—Others will not think so. But are not pictures always deteriorated in individual effect in exhibitions? Is it not the common lot—do not all suffer?

Studens.—Well, not always. I have really seen some few pictures look better in the exhibition than out of it, but I own these are not many: they are the very few exceptions to a very large rule. And those perhaps are not the best works;—it is some comfort to feel that!

Amicus.—It is however, I suppose, an advantage to every artist to see his works in the exhibition by the side of others. It must tell him where he stands, and his faults; and in some degree may, I should imagine, instruct him how to amend them.

Studens.—Yes: it is a true monitor, though a stern one.

Amicus.—Yet friendly in the long run. No doubt it must be one of the severest tests an artist can have of his own cherished works, to see them side by side with the cherished productions of others, all struggling to be first.

Studens.—It is a mutual lesson. We teach one another, and should receive the admonition with equanimity. The real friend is he, no doubt, who tells you the truth even at the chance of displeasing you; and in this sense an exhibition is a true friend to each exhibitor, and saves, or should save, his intimates an unwelcome office. It shakes him, and wakes him from his dream, and bids him open his eyes. I do believe every one is more or less under an hallucination while he is painting a picture, and moreover fancies there is a great deal more in it than there actually is.

Amicus.—"Great wits to madness nearly are allied," which I take to indicate the mentally half-sea's-over state under which great works are produced. All mortal productions must have faults, and few of the highest of these would probably ever have been finished had the author been alive, while producing them, to all their demerits. In any great effort I can well fancy that the *furor*—the youth of the work—should be kept up as long as possible: though it may be well in the latter stages of finish to appeal "from Philip drunk to Philip sober." I mean to bring in common sense to prune off redundancies, emphasise excellences, and harmonise and complete the whole—in *se teres atque rotundus*.

Studens.—Horace's recommendation to the poet was, as you know, to put his effusions on a shelf for seven years ere they received his final emendations; but I doubt if the dear little round man, and exquisite hard, ever thoroughly adopted his own rule:—it is so much easier to give than to take good advice, even if it be our own! He wrote his verses for all time, and it may be well predicted that they will reach their destination, by the hold they have on us now. And all Arts have much analogy, but it may not be denied that in painting, some works that have been struck off comparatively at a heat are among the most successful.

Amicus.—Oh surely the best works of Art are those that evidence long study?

Studens.—Not those of Rubens! except you mean previous study not individual to the work. His are corporeal rather than mental works, and appeal more to the eye than to the intellect. But I did not mean what you object to. I mean *comparatively* "at a heat;" for instance, one could not let one's

picture wait on a shelf for seven years for its final touch! I don't think one can define any time exactly as the best for doing a picture in. Different artists pursue such different methods. Some like to concentrate themselves wholly on one work from its commencement to its end, while others prefer two or three to be going on at the same time, now working on one, now on the other. And then different works by the same artist will take such unexpectedly various amounts of time. Moreover, painting is rarely all plain sailing; there is generally an agony-point to double somewhere in the voyage, and the time you arrive in port a good deal depends on the weather you meet with at this Cape! (of Good Hope or no, as it may be) so you see—

"You gentlemen of England who live at home at ease,
How little do you think upon the dangers of the seas."

Amicus.—But apart from similes you must think that ample time is essential to the production of fine painting as to other fine works.

Studens.—"Ample" means enough; I don't suppose it involves much to spare. In Pope's recipe for an epic poem, he recommends spreading out thoughts *varia*—adding, "they will be sure to cool." Now fresco-painting has all to be done in this hot state—there is no retouching.

Amicus.—But the cartoon is carefully studied first.

Studens.—Yes; but the artist in doing the real work is sure to attempt something beyond his preparatory level, or he is no true artist. We have it on authority, how Michael Angelo did the whole ceilings of the Sistine Chapel without assistance, in three years. That, it must be allowed, was very rapid; and from the multitude of works which the divine Raffaello produced in his short life he must have worked as rapidly too.

Amicus.—These men, at any rate, could not have had many "agony-points" to double. They must have begun by knowing exactly what they wanted to do, and have gone straight on to the end; going over so much ground every day, like a house-painter. I suppose these men are to be taken as exceptions.

Studens.—They were wonders for power. But they had no doubt their trials too; of this, one at least has left evidences—Michael Angelo—in the many works in marble he has left unfinished.

Amicus.—That might be from his impatience.

Studens.—No; of the marble works he has left incomplete several could not be finished. There is not stone enough left—it is cut away; and all sorts of incorrectness occurs—limbs of all kinds of lengths; but there is always the "great gusto." But I like them as they are with all their faults, and love them more than other people's perfections; however, he certainly worked in a hurry.

Amicus.—And in an hallucination?

Studens.—Oh yes; great as his achievements were, they were no doubt no more up to his dreams than other people's achievements are to theirs—only his dreams were higher as well as his grasp. However, there were not exhibitions of Art—in our modern sense of the word—in those days; artists had not to work up to time—to a particular day.

Amicus.—I have heard more than one artist say that he *prefers* to be thus tied to time, and can work better so than under other circumstances.

Studens.—Well, so have I: however, then it must be quite requisite to get into an hallucination, and railroad-paced *furor*. The artist withdraws himself from the world, and shuts himself up with his picture like an enchanter with his abracadabra, in his studio for a cave. Strict are the orders given, "Mr. So-and-so can see no one: he is finishing his picture for the Royal Academy." Thus saith his servant, as he or she opens the door, stationed in the midst an incarnate emblem of no thoroughfare. The artist meanwhile in his inner cell (crouched over his picture, or standing at distance, palette, maulstick, and brushes, held out wide at different angles, contemplating the next touch ere he rushes again at his canvas) lives in a delicious dream of hardwork and glory. Hour after hour, day after day, week after week passes; his vision takes form, expands into life, and lives on the surface of his canvas. At last the fated hour comes when it must go. The moment taps at the door. The arrival of the frame has only preceded its departure with the picture it embraces, a short half hour. The artist has had but just time to contemplate it in its appropriate wreath of

gold, without which it appears that no easel picture can be complete. It is taken out carefully, it is put into the van, with various associates for the same destination, carefully by careful men. It is gone—a weight is off the artist's mind! The bow that has been long so tightly strung is unloosed, and the overwrought spirit extends and stretches itself to the utmost extent in unwonted but delicious laxity. After awhile, however, his eye re-seeks his easel. It seems to gape like himself in vacancy. He tries to realise his picture on it. "Well," he exclaims, "I could have given it a few mere touches, but I am glad it is gone. I have worked hard, and now I'll luxuriate. I'll think no more of pictures for the next week." With this laudable resolve he steps across the threshold, but, vain thought! after awhile the image of his picture follows him.

"Post equitem sedit atra cura."

Not *atra* now, however, for everything is *coulour de rose*. It rises up before him like an exhalation, with a halo of the fancied glory it will reflect on its author! Of course he feels quite sure it will be accepted—the contrary contingency is among the impossibilities of nature! Moreover it will be well hung—of course.—A good place could not be denied to such a work, and he reckons on the quiet absorption he will have of the meed of praise. He thus bolsters hopes up into certainties, and is a happy man. Still it must be owned that as the time which is to decide its fate approaches, his confidence and courage (like Acres') oozes out somewhat from the palms of his hands! However, we will suppose the powers to be propitious. His two first hopes come *quite* true. His cherished work is accepted and well hung. In addition, moreover, it is very passably admired, but not by himself. Among the first who rush into the exhibition rooms on the opening day is our artist. He walks rapidly through the rooms and sees it not, and almost prepares himself for the lowest depth of Art-fate—"Rejection;" but his hurry has given him a needless pang. On returning with less hasty steps he recognises his cherished work, in what also he cannot deny, is a very fair place; but, "Oh flesh, how art thou fishified!" "Is that my picture! can that be my work!" he exclaims. He goes closer. It actually seems to stare at him like an embodied vital being, and to reproach him, its author, as the monster did "Frankenstein," for the miserable appearance it makes! "Ah!" he exclaims again, after a few moments of sorrowful contemplation, during which his excited heart-beatings have slackened down to a more equable pulse, "I am a sleeper awakened indeed! O child of my brain and Art, thou art indeed but the Iphiclus to the Heracles I thought thee. What I falsely thought delicacy in thee is feebleness; thy force is blackness; thy warmth hot, and thy freshness cold—cold as the North Pole!" Down goes the artist's own thermometer of spirits considerably below zero; in which condition he re-crosses the threshold of the National Gallery.

Amicus.—What! without looking at the other pictures?

Studens.—I am only supposing a very extreme case, where the shock of the disorder has been of a very malignant character indeed! In usual cases he looks with so much attention over the other works that he almost forgets his own, and is carried away, perhaps, quite by admiration of some other work; for really British artists are not a jealous class, whatever the world may say. But to return to my theme, and to speak in sober truth—I doubt whether any contributor to the exhibition passes out of its doors at his first visit to it *happy*—at least, if he does, he has a most enviable degree of self-content!

Amicus.—Or a most unenviable degree of blindness. But if an exhibition is so fraught with disappointment to those whose pictures are accepted and well hung, what must be the feelings of those who have their works rejected altogether?

Studens.—There seem to be three degrees of disappointment: that of the man whose work is well hung, and he does not like the look of it; that of him whose work is badly hung; and of him whose work is not hung at all. And I hardly know which situation is felt most acutely. The man whose work is well hung can put no flattering unction to his soul that it is the disadvantage of place that gives it so incomplete an appearance. His shortcomings, his

* Continued from p. 202.

errors, are all his own; but he, whose work is badly hung, elings to this mishap as an excuse for all its defects—a loophole to escape from self-reproach. "It can't," he exclaims, "be seen there at all—how that picture injures it! How differently it would have looked here!" and kind friends chime in with his remarks, and aid his resources of throwing the blame on other people.

Amicus.—But he who is rejected altogether?

Students.—Oh, he is an injured man, of course; and he sees in his mind envy, hatred, and malice, and all uncharitableness, hovering over the Academy like harpies, or presiding at her councils like amiable compounds of Fates and Furies! But even in this third and ultimate case, as regards self-judgment, the aspirant escapes the hard competitive rubs of other works against his own. He thinks quite as well of his picture as ever, and is left free to image to himself and others the effect his work would have had if it *had* been accepted—only accepted: "it would not have mattered where it were hung—even in the Octagon Room; it would have made its public for itself: it could not have been hid." This, if he does not say or think himself, some dear mother or kind sister suggests it as balm to the wounded spirit, which his ready ear drinks in only too readily—for the ouns of his rejection rests probably with himself.

Amicus.—But you would not say that injustice is never done?

Students.—R.A. does not stand for "Real Angel." The Royal Academy are but men, and therefore they are not perfect, nor are they always right in judgment; but I believe they are as fair as any other body of men would be. The selecting council take vast care and attention in their selection; and as for the poor hangers—I fully believe that were each weighed at the commencement and at the end of their month's labour and anxiety, they would be found much lighter for their work.

Amicus.—Such a statistic might shield them from vituperation.

Students.—Apart from the responsibility of having to arrange in a short time, and within a confined space, the principal British Art-labours of the year, it is really a very difficult thing to arrange pictures well. They injure or harmonise with each other in juxtaposition to a far greater extent than any but artists can appreciate. One of the best pieces of picture-hanging I ever saw was the British portion of the Beaux-Arts at Paris last year; but there the arrangers had the advantage of their materials being the selected works of years, instead of the efforts of one year. If our artists do not paint better than the French, they certainly "hang" better.

Amicus.—I wonder if our neighbours have the same idea. I suppose we have all something to learn. I like to see the Art-works of various countries together. That Beaux-Arts Exhibition was a great benefit to all lovers of the gentle craft of brush and palette. It was well to see our British works there, and I like to see foreign works here, in our exhibitions—the reciprocity is useful.

Students.—If it is not, as the Irishman said, "all one side!" The worst of it is, that though foreign works are purchased here from our exhibitions, ours would not be bought abroad.

Amicus.—I suppose that is a penalty we pay for being the richer country. However, we are sufficient for ourselves. There is a large current sale of British pictures in this country.

Students.—Oh! we have no reason to complain on the whole of the general encouragement for our Art. It is at the present time far more than could have been predicted forty, thirty—nay, twenty years ago. It is not perhaps the highest style of Art that is most encouraged in this country; but then we must recollect that this also applies to literature.

Amicus.—Macaulay's works are surely not only highly appreciated, but are most extensively read; and a bookseller would add, "profitable speculations."

Students.—Yes, they are exceptions to which one turns with pleasure. Assuredly Macaulay's works are among the few in the present day that will live. That they are appreciated is very hopeful for literature and the taste of the people; and I believe the taste in Art is on the rise, too; and that those buyers who began by only relishing a bit of rustic landscape, or rustic beauty, or pictures of animals, will end by equally cherishing the higher

aims of the muse. When I talk of bits of landscapes and animal pictures, do not think for a moment that I decry them, or ever wish to see them have less encouragement than they have now, only I should like to see the other walk have its due proportion too. Art to be a truth must be the exponent of the time and people, and British Art would cease to be British if it did not bud and blossom out into all those familiar scenes and objects that we British love so much; but I am always glad to see encouragement and appreciation attach itself to a style of Art analogous, we may say, to Macaulay's province in literature.

Amicus.—I have heard some one mention as the characteristics requisite of an historical work, that there should be a man with a brown back in the foreground, and that the whole work should be intensely uninteresting!

Students.—And you would be the first to say, too, that Macaulay is not uninteresting, and that his style might be appropriately brought in to illustrate what an historical picture should be—not a collection of dry details and date, but instinct with vital existence and character—epic, dramatic, biographic, individual. Macaulay has the power to make his people move and speak; you see them—hear them, and in analogy so should painting.

Amicus.—And so, I am sure, do some of our painters of the present day. We are not obliged to look abroad to Paul Delaroche and others; we have men who do this here—and they are encouraged.

Students.—But they are obliged to paint on a less scale than is desirable.

Amicus.—That is on account of the size of our houses, which do not admit of very large pictures.

Students.—Exactly; I have no objection to small pictures, but let us have large ones too. If individuals encourage the small scale, so should Government encourage the large. She should set apart a certain annual sum out of our national resources for such full-sized works, as should be best illustrative of our historical, actual, poetical, biographical facts and character, past and present.

Amicus.—Earl Stanhope has originated an advance in that direction by his excellent motion of a portrait gallery of British worthies, and the house has endorsed it.

Students.—I trust it is the smaller end of the wedge. Excellent in itself, I hope greater things will follow. Anything in that way carried out by the legislature will be well appreciated by the people. We are a commercial people: and who are now the great supporters of Art in this country—the great buyers? Why, the men who have made their money by commerce; and they appreciate what is done judiciously in the furtherance of Art by the powers that be. For why? They love it themselves. What would our painters do without Manchester and Liverpool? It is not our hereditary peerage now that supports Art; it is our wealthy aristocracy of energy and commerce. And this is what gives the highest hope for Art, and of that continued and substantial nourishment by means of which alone Art can be expected to put forth its best bloom. Artists must live to be able to paint. And this renders the prices of pictures of so much importance. It is only of late years that modern Art has really become of commercial value. The spirit of our country is commercial, and with this our Art must be in some way united to advance. Art has never stood alone; it has been ever supported by something stronger than itself,—the agent of a creed or a state policy. It must here have a basis of commercial value to rest on. This it has gained. What a difference from former times!—When Wilkie sold his "Village Politicians" for £30, his associates and contemporaries thought him a lucky fellow; and, without making invidious comparisons, the exhibition of this year will yield us strong examples of pictures not nearly as good yielding to the authors ten or twenty times as much. What would such a picture sell for if it were produced now?

Amicus.—And how has all this been done? I suppose picture dealers have helped it.

Students.—I own it so; and we must not be too keen in finding fault with the staff that has propped us. It is but a few years ago that nothing but old pictures would go down, and that manufactories of Raffaelles, &c., supplied those unfortunate country gentlemen, who, unhappily for their pockets, fancied

they had a taste. The public dealer then decried recent pictures, and would allow no genius to a modern brush. The pseudo-Raffaello and Correggio trade, however, became somewhat overblown and blown upon too; and some of the more intelligent among those who had turned their attention to trade in Art began to perceive that there was a field for making money in the works of the day, which were pressing their way upwards in spite of the "old masters." I do not give picture dealers in general much credit for an abstract attachment to Art for its own sake, although there are honourable exceptions doubtless. It was their keen sense of interest that saw that the time was come for modern pictures to have a commercial value. It became their interest to raise the public estimation of this branch. No doubt the dealers take up pets among the artists, but on the whole they have been useful to modern Art; and for their good incomes and pleasant establishments many of our painters are very considerably indebted to them.

Amicus.—And such men as Mr. Ruskin do good too.

Students.—Yes—the dealers buy pictures to sell; and Mr. Ruskin writes books about Art to sell; and they both do good to the subject they treat. They both work at their mission, and I give both credit for not being wholly influenced by personal motives. Even the predominance of Mr. Ruskin's organ of destruction is a great agent for good. He sweeps his goosequill this way and that; he makes a clearance. He is a good pioneer; he takes up his axe and strides forth into the woods, and, like Billy Kirby, in Cooper's admirable tale of the American border, delights in the destruction he makes. Whether he could utilise into an edifice the materials he fells, is another matter.

Amicus.—Talking of Ruskin is next of kin to speaking of Pre-Raffaellism. What think you of it this year in the exhibition?

Students.—Van-eckism rather—to which it is more allied in execution than to the art of Cimabue, Giotto, and that ilk. The success of an episode in Art like "Pre-Raffaellism" depends on a good many things, and at the time it first came out the town was just ripe for a diversion of archaeological art; and the especial phase it took could not have been better devised to hit the public had it been suggested by a shrewd picture dealer. There is "vis" in the men who took it up, and some admirable pieces of mere painting owe their existence to the effort; but as a style it is doomed.

Amicus.—Well, at one time, it seemed as if it were going to sweep all before it.

Students.—A sudden flow has by nature a sudden ebb. In my artistic recollection, which now spreads over a good many years, I can recollect several phases of Art that the public have overpraised which have had a sudden downfall. Taste is always oscillating, and is never but a moment in its true place of rest, but swerving either on this side or that, especially as regards works of the day; and no little injustice is sometimes attendant upon this. When the public have overpraised an artist very much, and the time comes to find out its mistake—which is always done in the long run—it revenges itself on the former subject of its adulation for the error it has committed; and having before deked him out with attributes to which he had no real claim, when the reaction has taken place, will not even allow him the excellences which he really does possess!

Amicus.—And would you include the press?

Students.—I will give you a ease in point years ago. A leading journal, some fifteen years ago, praised up, I think beyond his merit, the most imaginative perhaps, or at least the most inventive of the "R.A.'s," then quite a young man, whose multitudinous and poetic works took the artist-world quite by storm. Nothing was too great to be said of him, and half a column was not enough mention of his excellences. His works had many great merits, but did not deserve to be set forth as equal to those of Raffaelle. They have the same qualities now as they then had; and yet we find the same journal, a few years ago, presuming to congratulate the public that the annual Royal Academy Exhibition that year had no work by that artist, coupling him with another high name—that of a fellow-countryman of his—whose works are standard! Thus do we adulate an image into a god, and find-

ing we are wrong, revenge ourselves by dashing it all to pieces!

Amicus.—And is Pre-Raffaellism in danger in like manner?

Students.—I should not wonder if a few years hence it is ranked lower than it deserves.

Amicus.—It does not appear even now to be so much in the ascendant as it was last year, which perhaps may have been its time of crisis. But you do not deny great merit in it? such a public success is not without some foundation.

Students.—There is the merit of fagging out in it; it is a kind of Daguerreotype painting. But critics have not discriminated its qualities. With some few exceptions, Pre-Raffaellism has had the merit solely of execution, and not of sentiment. The extremeness of ugliness has been very truthfully displayed by it; but it is much easier to portray ugliness than beauty, and meanness than dignity. There can be no substitute for beauty. There has been much pseudo-faithfulness in Pre-Raffaellism, obtained by emphasising ugliness both of form and tint. It thus gets the praise of truth for actual untruth, and for power from want of power. Pre-Raffaellism has dealt largely in ugliness; and if that were allowable before the time of Raffaele, it assuredly is not so after, when that great master left so many examples of the most human and faithful expression, combined with the greatest beauty. What would the world think if a corps of sculptors were to be Pre-Phidian, and give us a number of Cyclopean and Assyrian rude idols?

Amicus.—But surely you agree in the Pre-Raffaellism having done good to the English school?

Students.—There is a vigour in the episode, and there is a definition in its art that is well opposed to shiplop. But I hold most of the Pre-Raffaellite effects to be false; they have a similar reference to nature, in regard to relief, as a plant pressed in a "hortus-siccus" has to the free flower in nature—flat and distorted. Forms are set forth by them with such confidence, that the world hardly ventures to call them ill drawn—hardly supposes the artist would venture to put them forward with such startling earnestness if they were not true. You will say, perhaps, I am talking illiberally of this school; but I am simply expressing what I cannot be blind to, and opposing an undue cry for certain peculiarities which have no foundation in true Art. There is no excuse for disagreeableness in Art; and though I may see some excellent qualities in the Pre-Raffaellite school, I hardly know a picture among their productions which I covet, or that I believe will hold the ground it at present occupies.

Amicus.—But do not you think that the young men who have commenced this school will do great things when their peculiarities are modified by time?

Students.—I should hope so; I believe there is an excellent likelihood of it. But I have lived long enough in Art not to put faith in promises; I believe in works when they are done, and not till then.

Amicus.—They certainly number among them men of great talent.

Students.—Undoubtedly. Moreover, it is not, perhaps, that I estimate the productions of the Pre-Raffaellites lower than other people, but that I estimate those of a more unaffected style higher. Out of the present exhibition, even among the productions of the young men, it is not the Pre-Raffaellite pictures I should wish to have, either for my own pleasure or for their abstract merit. I see other pictures there which have their excellences without their demerits. Pre-Raffaellism is an overstrained style in all its material points; and its sentiment, even when effective, is apt to be overstrained too. But to this there are exceptions; but as a style it does not appear to be a working out of unaffected, simple thought.

Amicus.—Rather legendary too, perhaps, than historic or epic; and for its success in some degree to be obliged to Mr. Ruskin.

Students.—Perhaps.

Amicus.—And to the picture dealers?

Students.—I do not say that.

Amicus.—You do not actually affirm it! Still these gentlemen must be very powerful with the public. This reminds me of what I heard a sculptor exclaim the other day at an Art-discussion, in which the press and dealers were severely handled:—"I wish Mr. Ruskin and the dealers would only take me up too, and my Art!"

THE LATE EARL OF BELFAST.

ENGRAVED BY R. A. ARLETT, FROM THE STATUE
BY P. MACDOWELL, R.A.

It is our intention occasionally to introduce into the *Art-Journal*, as circumstances may seem to render it advisable, engravings from some of the numerous statues which have recently been erected to the memory of distinguished individuals. Portrait sculpture has, within the last few years, met with great encouragement, and, as a consequence, has advanced in style and character. In making our selection of such works, it will be our object to choose those only which appear to us worthy of being classed with the poetical conceptions of ideal sculpture.

We commence then with an engraving from the bronze statue by MacDowell, recently erected by public subscription in the town of Belfast, to the memory of the late Earl of Belfast, son of the Marquis of Donegall. We must borrow some fragments from the eloquent address delivered at the inauguration of the statue by the Lord-Lieutenant of Ireland, the Earl of Carlisle, as a more fitting tribute to the worth of his young friend than any words we can offer:—

"For what purpose, let me ask, is it that we are now assembled? To pass what, in both ancient and modern nations, has been always reckoned as the highest and culminating honour which can attach to the departed—to raise a statue to their memory, in the full light of day, when the concourse of men is thickest. And to whom, let me ask also, is this honour to be assigned? Is it to the successful warrior, who has defended the firesides and upheld the glories of his native land? Is it to the veteran statesman, whose long career of honoured years has been numbered by benefits bestowed on his fellow-countrymen? Is it to the powerful monarch whose will is law, whose breath is patronage? No; but to a young man who had only attained the age of twenty-five years, who had never filled any public station; and who, if connected with the people of this district by the ties of hereditary descent, and anticipated inheritance of property, yet now, from his cold grave, cannot remunerate, or even thank, one human being. . . . It is some praise that a young man of one of the first families in the country, born, so to speak, in the purple, reared amidst all softness, inclined as well by temperament as by training to the keenest susceptibilities of refinement—to the polished and imaginative side of human existence—to the soft influences of Art, and music, and song, should not yet have confined himself to those smooth limits and trim enclosures, from which the bleak winds of our working-day world are shut out so carefully, but should have taken the more real as well as the more generous view of the true purposes of human existence. From the days of his early boyhood he had a strong, I may say a fervent wish to apply the faculties which his Creator had given him to the service of his fellow-men, and especially of his fellow-countrymen. . . . I have hinted at his aptitude for musical composition, in which he showed such remarkable proficiency. Well, I find that the sale of his earliest musical compositions brought him the sum of £100, which he applied to the relief of the sufferers by famine in the dreadful years of 1846 and 1847. He had long entertained an eager hope of founding in this city an institution containing reading and lecture-rooms for the working classes, with a gallery for painting and sculpture—arts which he loved and appreciated so well. I have a mournful satisfaction in referring to him as an associate in the delivery of lectures in public assemblies; and many of you, I doubt not, will remember with pleasure the promptitude with which he came forward to make his first speech in public, on a sudden emergency, at the opening of the Belfast School of Design."

Such is a brief sketch of the man whom the citizens of Belfast, who could perhaps best appreciate his worth, have delighted to honour. MacDowell's statue of this gifted young noble realises his person and character with unqualified success; it is not alone a beautiful work of Art, but it reflects the beauties of the mind and person of him who—

"Gentle, wise, and good,
Manhood's loftiest aims pursued
With a heart of maidenhood."

He died of consumption, at Naples, in 1853.

THE ART SEASON OF 1856.

WE are not so ungrateful as to give the sum of the season as—*par et preterea nihil*; the glad tidings of peace came in time to give happiness to many hearths; the impulse was soon felt—men of genius, who, at the end of last year, knew not when they might again be employed, have been gradually yet fully re-commissioned. But sculpture does not so soon recover from a state of depression as painting. We could name artists of eminence in this department who have not received a commission during the last twelve months; hence the meagre exhibition of sculpture this year. We very ingenuously declare ourselves destitute of taste for large Art; but verily there must be somewhere a craving appetite for minor productions. We see yearly thousands of pictures; and of these, hundreds are good enough or bad enough to impress the memory inasmuch that they may be remembered; but having disappeared from the walls of the exhibition rooms, how rarely do we again see any of them! Of some few of paramount excellence we learn the destination; we may know their whereabouts, though we may never see them again. We have seen known works distributed and re-distributed by the hammer of the auctioneer, yet these bear an insignificant proportion to those purchased directly from the painter, and indirectly from them through dealers. The great proportion of collections now in progress of formation are the property of the middle classes, to whose patronage in a very great measure the prosperity of Art is indebted. Those of our countrymen who are facetiously termed the "cotton lords" and the "iron princes" of our land, are munificent buyers of the works of living artists, and all therefore of the productions which they acquire will hereafter be property unquestionably genuine; whereas those collections, generally, of so-called old masters, formed under the insufficient warranty of foreign dealers, will, under the matter-of-fact test of the auctioneer's hammer, realise one twentieth of their cost.—With reference to the sales of our modern Art, and the channels into which it flows, the fact we state would be attested by the sale-books of the different Art-societies, if we were to refer back during the few last years to these records.

We had last year to note a falling off in the receipts of the Royal Academy, but we believe that this season the amount derived from visitors is an improvement upon that of 1855, though yet far below that of 1851, the Great Exhibition year. The summing up of last year was a source of consternation to the royal body; it showed that their course of prosperity might be interrupted by causes even difficult of explanation. Many really sensible and practicable hints have been lately thrown out with a view to their adoption for the improvements of the institution, but as a body they are not yet sufficiently advanced to admit of any liberal change. They have a considerable measure of justice to fulfil before they can enter upon any course of what will be called liberality. Alas! the lady whom they have peddled as their deity of justice is not blinded, and her scales and weights are adjusted to an infinitesimal *avoidsupois*. But of the exclusiveness of the Academy enough has been said; the ill-judged elections must bring about the ultimate remedy. The long list of portraits and pictures previously sold that are sent for exhibition to the Academy renders the question of the amount of sales somewhat difficult of solution: the prices at which the more important works have been commissioned and disposed of are generally known, but we have no space to individualise—it is enough to say that the worst have realised the largest sums. In comparison with the amount paid into the Academy those received by the other institutions are small, but they are generally considered average returns, some even beyond a mean computation. The Society of British Artists exhibited eight hundred and forty works, of which two hundred were sold, independently of those disposed of before exhibition, and the amount received was £6000. The catalogue of the National Institution gives a list of five hundred and eighty works, of which a proportion was sold to the amount of £3000. The Society of Painters in Water-Colours have exhibited three hundred drawings, of which two hundred and twenty-two were

ENGRAVED BY R. A. ARTLETT, FROM THE STATUE BY P. MAC DONALD, R.A.

sold, including all the large and principal works. To this gallery there has been a great increase of visitors this season—an augmentation of eight thousand beyond that of 1851, when the doors were kept open a fortnight beyond the accustomed term. Upon several occasions, at the early part of the season, the press of visitors was so great that the staircase was most inconveniently crowded, as was also the room, and numbers were obliged to postpone their visit until a more favourable opportunity. This institution, in its policy, is a model well worthy of imitation by the Royal Academy; it never rejects any candidate of a certain degree of merit; and perhaps the circumstances attending the last election are unique in the history of such institutions—we mean the withdrawal and re-election of Harding and Holland, both of whom have been treated by the Academy in a manner pointedly insulting. The New Society of Painters in Water-Colours exhibited three hundred and forty-nine drawings, of which one hundred and fifty were sold, realising an amount between two and three thousand pounds; and thus supposing the British Institution to have exhibited five hundred and fifty pictures, there have been seen in the various exhibitions more than three thousand works of Art never before exhibited.

In a list so numerous the landscape subject-matter is of every variety; there is no locality of any pictorial interest that is not represented—and, for the sake of a *variorum*, very many of no pictorial interest at all—abstracts of every region lying between the sunniest parallels of the palmy latitudes, and the perennial obscurity of others condemned to lie for ever countless fathoms below zero. Rome is no longer the “eternal” city; Venice now rejoices in that epithet—an everlasting theme in brick and mortar, which makes us long for the novelty of Hampstead and Wimbledon Common. Then there are the travelled landscapes—those of Egypt and India, with subjects even of Algerian scenery: hence, perhaps, we may be invited to perch like sea-birds on some islet-rock of the classic Archipelago; visit the site of Carthage, seasoned with a suggestion of Marius; or the ruins of Corinth, still guarded by the ghost of the Consul Mummius. We have scenes from Arcadia, teeming with flowers

“Sweeter than the lids of Juno’s eyes;”

and subjects among the sublimest Alps, veiled in snow, and suggesting themselves to the spectator as the gigantic handmaidens of some outraged consecration, and thus condemned for ever to stand mysteriously veiled. The Italian peninsula has supplied its quota, but without much variety—for painters, like sheep, tread in each other’s footsteps; hence the continued reproduction of the Italian lakes, the villages which lie scattered on their shores, and the mountains by which they are surrounded—their surfaces and the skies by which they are canopied afford but little variety of feature. We frequently turn from them with a sense of refreshment to the surging waters of the North Sea. But after all, what is there equal in freshness to the landscape of our own isles? The trees are picturesque beyond everything elsewhere to be seen, and the combinations of lake and mountain in the lake districts of England, Wales, Ireland, and Scotland, are unequalled in the world. Switzerland and the Italian lakes are much bepraised by travellers; but all travellers are not painters, and it requires some knowledge of Art to learn that mountainous Switzerland does not paint well; and all that can in any wise vie with our romantic landscape are the lakes of Switzerland and Italy, while there is nothing that approaches the verdure of our wooded landscapes, which, be it understood, is much more difficult to paint than Italian scenery.

In our first glance of the contents of the Academy this year we were struck by the number of large portraits, and the quantity of small pictures. The community of painters seemed to have been laid asleep by the wand of some enchanter during the greater part of the year, and to have shaken off the soporific influence only just in time to paint a picture for the exhibition, without a thought to give to the selection of subject. If this were once the case it would not excite notice, but it is always the same. We repeat what we have before so frequently said—these exhibitions betray a melancholy want of reading among our pro-

fessors of Art. There are a few works which are invested with the dignity of historical narrative. Elmore’s “Charles V.” is one; it has been painted before, but never so well; we wish he had painted a subject entirely original, and equally well. Ward’s picture is also full of earnestness and thought, but he is painting too much from the first French revolution. In such melodramatic subjects as “Andrew Marvell returning the Bribe” (Wallis) there is much interest, but the subject is not made the most of. “The Death of Chatterton,” by the same, is better. “Cromwell at the Traitor’s Gate” (F. Goodall) is an admirable subject, and treated with a becoming sentiment. It is extraordinary, that of more than thirteen hundred works there should be so few painted with a real feeling for originality and the dignity of historic and didactic Art. There can be no hope of anything great from Pre-Raphaelism, as all compositions in this manner are constituted of *minutiae*. Paton has never professed Pre-Raphaelism, but his picture, “Home,” combines breadth and finish with a feeling that the new school would do well to imitate. In bygone years we have protested against the abuse of Don Quixote, and the Vicar of Wakefield: they have disappeared from the scene, but there is no improvement—we seem rather to have receded. Dr. Primrose and the knight of the useful countenance are succeeded by a rapid sentimentality and the most commonplace vulgarity. If a novel and telling subject be exhibited by one painter, it is dwelt upon by others for years afterwards. Incident and accident of the most ordinary kind are elaborated with a care which, applied to a worthy subject, must result in a first-class picture. We are weary of theatrical rusticity and improbable vagabondism, cottage scenery and prim-looking charity-girls. It is true that the public have bought largely of these things; but then the public in matters of Art are not their own keepers,—yet it appears that it rests solely with them to raise the standard of subject-matter, if painters will not make any effort at self-instruction.

CORRESPONDENCE.

To the Editor of “THE ART-JOURNAL.”

THE NATIONAL GALLERY.

[We have received the following letter on this subject. By our notice of last month may be seen how entirely we differ from the writer of it. We deem his proposal visionary, nevertheless we insert it—considering it one of the duties of our Journal to afford an open arena for the discussion of such subjects.]

SIR,—In the *Art-Journal* of this month (August), in your article concerning the National Gallery, and its removal (which you advocate) to the Gore Estate, Kensington, the question is put, “Where, if it be not to go thither, shall it go?” *A propos* of this question, I address to you the following remarks; and if they be given in a somewhat roundabout way, I hope you will excuse it.

“Are our Art-institutions to be central or suburban?” appears to be a question that will soon again occupy the attention of Government. As an abstraction there appears to me but little doubt as to the reply. If Art is to enter into the heart of the people of this great metropolis, it is not to be effected by removing it to the outskirts. If benefiting the people be an object, by affording them all those civilising and intellectual and refining advantages derivable from the contemplation of fine works of Art; and if benefiting Art be also an object, by accustoming the people to the delights of it, and rendering it more a necessity to them than it is now, evidently such a site as would offer to the people and the pictures the readiest facilities for being together would be the best.

Charing Cross is now very nearly the centre of London, as a glance on the map will show, and it is from this point that it has been proposed to remove the national pictures to the beautiful suburb of Kensington. A reason presented for this is the evils they suffer from the smoke of London. Now the smoke will eventually either be done away with by artificial means or it will not. If it be done away with, which there are excellent reasons for believing the ingenuity of man will ere long effect, the great argument for the removal of the pictures equally vanishes; and if it be not done away with, London is so rapidly increasing to the westward that in a

few short years, perhaps by the time the new arrangements are completed (for the pace of Government proceedings is well known), the smoke will have overtaken the pictures again in their new site! I am not a believer, at all to the extent that has been alleged, in the destructive influences of smoke; but I would rather have all the pictures covered with glass, as some of them already are, where the people should have facilities for visiting them, than uncovered—as is undoubtedly the best mode of exhibiting oil-paintings—where but a tithe of the same numbers would ever go to visit them.

I am for the centralisation of Art, but not for its centralisation on the edge of London. I am for its centralisation in the centre of London, where I would have not only the national works of painting and sculpture, but also all those Government institutions of Art which are connected with the Board of Trade—viz., the central schools of design and museums of ornamental art. I do not say under one roof or under one management, but I hold that all these departments of Art, as associated in elements and objects—those of improving the tastes of the people—should not be far separated in situation, but be so placed in regard to each other as to be visited and consulted, whether for pleasure or study, by an easy transition. The more, indeed, they might seem to belong to each other the better,—as in itself involving a useful lesson much wanted here, that all these various departments are but higher and lower branches of the same great Art tree.

Now for the site. We have consulted the map once, let us do so again. You see Charing Cross, with its adjacent buildings, is situated on the *outside* of an angle of the Thames. What is situated on the *inside* of this angle?—I mean on the opposite—“the Borough” side of the water. Let us cross Hungerford Bridge, and see. Why, with the exception of a few wharves, warehouses, and manufactories, on the edge of the Thames, the space comprised between this portion of the bank of the river and the South-western Rail contains but a mass of small houses, tumbledown property, and waste ground. Moreover, see how the bridges of Westminster, Hungerford, Waterloo, Blackfriars, Southwark, and London, all converge to this spot, offering direct routes for transit hither, and rendering it more really the centre of London than any other spot. Some of us hardly, I believe, contemplate the Borough side of the town as in truth belonging to London, nor associate it in idea with anything but manufactories and warehouses; but, in an Art point of view, let them be assured that no spot on the river affords so fine a view of our magnificent metropolis and its various river attractions,—the new Houses of Parliament among them,—as is presented by this exact locality, as any one may verify any clear day at the farther end of Hungerford Bridge.

It is this spot which I would suggest to be occupied by British Art, with all her varied national treasures of tasteful instruction of that character. It is in this angle of the noble Thames that I would house them, and in such architectural accommodations and on such a terraced elevation as not only to command the finest river-view in London, but to offer equal beauties in turn to the London bank, and to the bridges, over which such ceaseless tides of population are continually pouring. Here should be located the government central school and museums of ornamental art, whose teachings are practically and more directly addressed to the manufacturing population, to whom such a situation for the consulting of their treasures as would enable them to visit them in an unoccupied hour or so, would be a vast boon. And here, too, should be the sister collections of painting and sculpture, and all which to them belongs; and here should be lecture halls for the people, where they might hear explained the principles on which the benefit of these things depend.

But this is not all that occurs to me. The contemplation of this site for British Art, and its neighbourhood to Charing Cross, leads at once to the vision of the vast advantage that might be taken of all this to endow London, at this central point, with a wide, expanded, free space, analogous to that of the Place de la Concorde, at Paris, opening out and introducing one bank of our great metropolis to the other, and the river to both. It is this mutuality that gives a great charm to this spot in Paris,—the Louvre and the St. Germain’s side, and the river and the old city, all forming the *ensemble*.

The advantage to Paris of the great opening of the Place de la Concorde cannot be over-estimated. I would suggest another such in London—uniting the two sides of our metropolis to our great river at its best point. For this it would be requisite for Government to occupy the before-mentioned portion of the Borough side which is comprised between the angle made by the river

at that end of Hungerford Bridge, and that portion of the South-western Railway which is near the Waterloo Station, and to lay this area out into a wide esplanade, with the requisite Art buildings. Also, to remove all the buildings between Charing Cross and the Thames where they most nearly approach, opening out that square to the river, and, in fine, to connect the two banks by such a bridge, or series of bridging edifices, as would, no doubt, under the hands of our architects, produce the grandest architectural passage of a river the world has yet seen.

Sir Robert Peel is said to have characterised Trafalgar Square as the noblest site in Europe! what would it be *then*? And think what a *lungs* it would be to London! The old town might draw in a long breath at the very thoughts of it! Government might then let the Royal Academy have the whole of that building of which they have now barely half, which would enable them, I hope, to rectify most of their present shortcomings; and across the water at either end of one great square, our académie Fine Arts would have in sight the cognate establishments of our national Art-treasures, and also of our schools and museums of ornament applied to trade, manufactures, and commerce. This would be real centralisation!

My letter has drawn out so long that I will not go into any details; but I shall be very ready, if it interest at all yourself or your readers, to fill up the sketch somewhat more at a future time.

I am, sir, yours, &c.,

W. L., A LOVER OF ART.

[We think our correspondent had better be content with the "sketch" he has sent; the "filling up" satisfactorily, even to himself, we fancy, he would find a difficult task. Many a pen-and-ink sketch will not "paint;" and there is no severer test to a visionary scheme than to pin its author down to a completion of its details.

We acknowledge readily that an open expanse in the centre of London would be an advantage to it. Thus far, and no further, can we go with our correspondent. But as regards the special subject on which he hangs his observations—viz., "the location of the National Gallery," nothing can be wider of the mark than the point he indicates. The immediate propinquity of the Thames (which forms such an element in his plan), in its present state, with its villanous variety of exhalations, would certainly be no advantage to the national pictures, which are considered with justice to be injured by even the atmosphere of their present site. Our correspondent is very hopeful as to the speedy doing away of smoke—we wish we had grounds for a similar faith! Our views as to the proper site for our treasures of Art are already before the public; and the objections of our correspondent are mainly anticipated and answered in our article of last month. We will just now, therefore, add little more on this subject; yet we would assure our correspondent that, unresponsive as our houses of legislature usually are to the calls and interests of Art, they are not so indifferent to them as for a moment to entertain the idea of placing our national pictures amid the fetid steams of bone and hide warehouses, or manufactories of pyrolignic acid and vitriol.

Notwithstanding the success of Lord Elcho's motion in the House of Commons, and the report of a committee which we are to look for in consequence, the Art-buildings will be erected at Kensington Gore!

All the arguments put forward have failed to carry conviction that this site—Kensington Gore—is not, all things considered, the best. Indeed, there has been no attempt to point out any other, except that which is still more distant from the heart of the metropolis—Kensington Gardens. Surely we may lay some stress on the fact that the large amount of space at Kensington Gore is bought and paid for—a moiety of its cost having been met by the surplus fund of the memorable year 1851—a great fact!

The delay caused by the proceedings of the House of Commons is much to be deplored; it will do some mischief, but no possible good; for, of a surety, the result will be—when certain meetings have taken place, a score or two of witnesses have been examined, and the proceedings carefully printed—the issuing of a report recommending Parliament to proceed to erect buildings at Kensington Gore, for the erection of which annual grants will be moved for and voted.—Ed. A.-J.]

THE ANTECEDENTS OF OUR CABINET AND ORNAMENTAL BRONZES.

A MOST prolific school of Art is the French quasi-sculptural; that which teems with little bronzes of every imaginative form and character—at least, those productions which are good-naturedly called in the mass "bronzes"—heroic, poetic, eccentric, cinquecento, Renaissance—everything. The cradle of their earliest manner was Nuremberg; but the crisp and hirsute curiosities of the progress of the art have nothing in common with the sober dignities of Peter Vischer and Veit Stoss. The Nuremberg bronze art of the last quarter of the fifteenth and the first quarter of the sixteenth century is one thing—the bronze art of the present day is another: and yet the latter has marked relations with the former. Our memories of Nuremberg are refreshed by Kugler in an article in the *Kunstblatt*, though we cannot assent to all his conclusions: we have never been able to divest ourselves of an opinion, deliberately formed, that the present period of German Art is not its most admirable epoch—certainly not that by which its earlier stages are to be criticised. What a deep impression does the St. Sebald monument, by Vischer, leave upon the mind of every lover of Art! he is struck with wonder at the amount of the artist's information—for in those days the means and appliances of Art were few and limited. It is true that he has worked rather from his feeling than from any fundamental knowledge of those early principles of the Gothic, which were gradually developed from the classic traditions that in Italy had begun to reign paramount. The entire construction of the tabernacle which encloses the reliquarium of St. Sebald is essentially Gothic, and the somewhat obtuse pyramidal coronals remind us of the very earliest Gothic; while the capitals, basements, &c., suggest all the licences of the Renaissance, and the compositions which accompany the figures recall Dürer's colossal wood carving in honour of the Emperor Max. It is thus curious to contemplate the variety of style, and even the infirmities of taste which prevail in this and other contemporary works; but we pass at once from complaints to well-merited admiration, even of the manner in which these influences are expressed. The statuettes of the apostles on the columns of the tabernacle, and the smaller ones of the prophets, evidence an inclination to the older types of the German style; and it is not at all difficult to understand this, when we remember the tyranny of manner in the execution of figures at this time. In the reliefs from the holy legend is traceable a certain classical freedom and beauty; and in the decorative compositions of a symbolical and ideal kind, the artist revels in that naturalism which declared itself in a manner so pronounced at the epoch of the Renaissance—this is especially seen in the draped female figures of this monument, and also in Vischer's allegorical designs descriptive of the Reformation. The same predilection is obvious in the numerous figures of children which enter into the composition, both in the upper and lower parts, and these are qualified by a captivating simplicity. The mythic decorative figures are very attractive, as possessing in full force the charm of the Renaissance—the most felicitous being the syren-like torch-bearers at the corners of the tabernacle, which are amongst the most original conceptions that could under such circumstances be realised. With respect to mechanical execution, that still bears the mark of the modelling-tool, inasmuch as to have left the work in some degree rough; but the greater part is distinguished by much original freshness and decision of touch. By no means the least remarkable feature of this great work is the manner in which it is put together, composed as it is of an infinity of minute parts. The resemblance already mentioned to certain of the works of Dürer may be further traced in the treatment of the nude, and in the introduction of a classical element. Thus not only is the degree of relationship between these artists declared, but also their respective differences, for Dürer does not participate in that disposition to Germanism so manifest in the peculiarities of this work. The beautiful Romhild monument is attributed to Peter Vischer; but it is evidently the production of different artists; and if Vischer had any share in the work, it extended

perhaps no farther than the bronze easting. There are also among the monuments in the Cathedral at Bamberg tombstones with the figures of prelates and bronze bas-reliefs, which are attributed to Peter Vischer; and it is satisfactorily shown that two of them are of Nuremberg execution—that of the Bishop Henry IV., and that of George II.; the latter cast after a drawing by the Bamberg artist Wolfgang Katzheimer; but inasmuch as this work is not to be compared with the St. Sebald's monument, it cannot be supposed that Vischer prepared the models. The ornamentation is of much beauty, but the figures are deficient in animation and artistic feeling. Portions of the monument of the Elector John Cicero, in the cathedral at Berlin, which are contemporary with these works, are infinitely superior in execution; so that even this composition, which was certainly cast by Vischer, is also doubted, on very plausible grounds, to have been a production of this master. But the reputation of this artist rests upon his Nuremberg works: his friends do his memory no service in attributing to him others with which his name may be associated only as to the bronzing. We cannot quit Nuremberg for any of the merely probable sites of monuments attributed to the St. Sebald's artist. And by the way, who was St. Sebald? we only know that this was his resting-place, and the scene of his miracles; he was canonized only in 1370, and immortalised by Vischer in 1519. But we cannot think of Nuremberg without remembering also other stars of that constellation that has now for more than three centuries shone with a steady light on the world of Art. Despite its mingled histories, we cannot withhold our most honest applause from the beautiful fountain by the Rupprechts and Schönhofen; there are sixteen admirable figures—let them be, if you will, the Electors of Mayence, Treves, Cologne, Bohemia, the Palatinate, Brandenburg, and Saxony; and let the rest be Joshua, David, Judas Maccabæus, Hector, Alexander, Julius Caesar, with Charlemagne and others—a society selected with a singular predilection for fighting men; but there they are, figures that we have recognised in all the Art-capitals of Europe, and with whom we have established a nodding acquaintance. Then there are the nude Virtues at the fountain in the Lorenzplatz, as old as the latter part of the sixteenth century; and then the famous Gänsemännchen, in the fruit-market, with a goose under each arm—everybody knows this most original figure, but nobody knows the name of the artist—most singular that the name of a public work so celebrated should be lost! It is not surprising that the author of a picture, which is private property, should be forgotten in its passage through the hands of many possessors; but (*parvum magno componere*) Cologne Cathedral and the Gänsemännchen are two curious examples of public forgetfulness. Of Veit Stoss, Adam Kraft, Wohlgemuth, and others, it is unnecessary to speak at any length; we have instanced enough for our purpose, which is to point out the excellence of the Nuremberg school, as abounding with material, not only for small bronze-work, but for metal compositions of any scale. Continually do we recognise the old guild figures from the walls of Florence (excellent for costume), only reproduced; and continually do we meet with some or other of these figures from Nuremberg undisguisedly as originals in modern works. This is not the use that an artist of any calibre at all makes of the productions of the great masters; they should be employed as stimulants and correctives. We cannot help admiring the excellence of the casting of the numberless minute objects which are now produced in metal, but we cannot in an equal degree praise generally the subjects which are adopted for execution. All these productions are of foreign manufacture; many are indeed admirable—those which are really artistic; but all persons of taste must deem otherwise of those which are merely mercantile. The Germans have carried zinc and iron castings to great perfection: and for large productions and copies, these casts are very effective—but at present we have seen few of them in this country. It is much to be regretted that there is among ourselves no enterprise in small bronzes; when this does arise, and we think that it must soon, it is much to be desired that, instead of the ultra-grotesque, our artists will essay something of the earnest nature-worship of our old and inestimable friend, Peter Vischer, of immortal memory.

HERALDRY MAY HAVE MEANING!

HERALDRY may be considered now by some as a merely decorative display, adopted by families for distinction alone, and being without import or any rational indicativeness. But this could not have always been the case with the "blazon of arms;" for if its usage had no more purpose than is now often applied to the art, its use would have died out long ago. Scholars have from time to time found in heraldic history an important branch of archaeology; and in times not very remote it was made auxiliary to family records, and the better determining of descents and alliances. Some of these heraldic histories would, if recited, be found curious and entertaining at least, if not instructive also; but, passing these more gravely industrious applications of heraldry into other hands, permit it be stated that some of the legends conveyed in blazonry are romantic, others are classical, and a still larger number are poetical and pleasing enough to engage attention for a brief while; and as a filling up of some minutes with at least one of the pleasant relaxations of literary leisure.

Many persons now adopt crests and coats-of-arms; would it not then be a step in literary progress if the meaning of these signs became somewhat of a living language to those who use them; and that the pictures chosen, or assumed, should again speak to the mind as well as to the eye, as they probably did to those who displayed coats-of-arms formerly?

PRACTICAL PURPOSES OF HERALDIC DEVICES.—It is found convenient to have a crest stamped on family plate, so as to identify it as property. Those who have carriages mark them with some emblem of this kind, to discriminate the ownership of the vehicle in a crowd. Many have their arms, or crest, printed neatly on paper, so as to be able to paste them into books, or put them on other portable property, which is done more conveniently than painting or writing names on them: these and other domestic uses for heraldic marks will be easily remembered; but family history may be sometimes helped out by heraldry; a tradition may by this key be turned into probability, or a probability may assume the consistency of facts.

AN HISTORICAL APPLICATION.—I had often heard that Bandon, the town of my nativity, was colonised by English settlers brought there by the great Earl of Cork; and as my family had been manufacturers in that town for a period as long as tradition ran, I, in the year 1827, asked Sir William Betham, Ulster King-at-Arms, whether there were any armorial bearings known to belong to the name of Dowden. Sir William made a regular search, and with friendly politeness handed to me a copy of the crest and shield of "Dowding, of Somersetshire," now "Dowden," of Bandon, county of Cork. Its description is:—"Crest—A catherine-wheel, azure. Shield—Argent, on a chevron Gules, bearing three fleurs-de-lis Or, between three doves of the second."* The motto superadded is, "Fide et Fervore." Now to give a meaning to these emblems. First, the crest—the catherine-wheel. The indication of some form of martyrdom is very usual in heraldic types, but this form of its infliction is among the least frequent. Saint Catherine, her legend says, was by the pagans immolated to their gods, and the instrument of her torture and death was a wheel armed with sharp knives; this wheel and its cruel blades being of steel, the steel, whitish-blue tint is the metal colour of this indication of suffering and endurance. This is our nearest history of the catherine-wheel; but if we go back to times antecedent to Christian martyrology, we find legendary lore connected with the "rota," or wheel, which has a less painful translation and import: mythological meaning, and classical characteristics, are revealed from its use. The wheel, we find, was one of Minerva's chosen emblems. We know that the wise goddess was a great spinner; indeed, somewhat too jealous of that art, and of her textile

tectonics, we remember how, with a blow of her shuttle, she "knocked the conceit" out of her rival in that Fine Art, and made poor Arachne into a spider, thus dooming her, for her daring, to "work at the web" for ever. Now as spinning is the pre-eminence of weaving, weavers claim high patronage—indeed, no less than that of Minerva herself; and as tradition in the family of the Dowdings says that they were weavers long ago, and modern fact declares that their descendants, the Dowdens, did not disgrace the continuance, or leave the patriarchal caste, that family may claim the wheel of Minerva as their emblem, having for a couple of centuries followed in their manufacturing manipulations the "art and mystery" of the goddess. A few other families also claim "a wheel" as their crest; be it then the spinning-wheel, it is the kindest key to their history, and I present to them freely this medium of intelligence, with its honours and its pleasures; the dignity of which is not severely limited to hand-cunning, but points out the protecting influence of the patroness of mind-wisdom as well. And now can any one desire a higher feather in his cap than that which may surmount a catherine-wheel crest in front of it? Again for awhile returning from the blue-eyed goddess Minerva, we come to our christianised mythism, and find all the appellatives of Pallas revived and continued in St. Catherine of Alexandria. This lady was the patroness saint of intellectual philosophy; she disputed in "the schools," and is in her pictured history represented as putting no less than fifty logomachies to silence! Surely this was a vigorous put forth of the disputations powers possessed by a lady saint. Brande, the antiquary, tells us in his "History of Popular Antiquities" something about her consequent beneficences as follows:—

"St. Catherine favours learned men,
And gives them wisdom hie;
And teacheth the resolving doubts,
And always yieldeth aide.
Against the scolding sophister
To make the reason staid."

So that we find wisdom and spinning have long been associated, and this successor of Minerva, in the curious old book called the "World of Wonders," is styled "St. Catherine, the Protectress of both Art and Science."

The floral distinction of St. Catherine is the well-known annual, with the blue blossom and extended calyx, made up of rays or filaments of green, somewhat resembling a cluster of thorns. Here we have the Catherine-flower, with its true-blue blossom, showing constancy, which persists for its time, although beset and encircled with these apparently thorny difficulties. The scientific name of the genus to which this flower belongs does not assist the legend in any way—*Nigella* only telling us of its black seeds; but the name "*Damascena*," which distinguishes the species botanically, turns our recollection to Damascus as one of its habitats, takes us in thought to the early crusading struggles for the possession of "the Holy Land;" and thus we find our flower within the series of badges proper to floral ecclesiastical ornamentation. These notes seem to contain the principal matters connected with the heraldic catherine-wheel; we take leave of that portion of the subject, and, following out the attempt to read heraldic history, the shield comes to be described in its import. The three doves are presented "Gules," or tinted in one of the shades of red, the colour of the African and Portuguese doves—"the collared turtles," tamed birds which our Crusaders probably knew familiarly; we describe these, a little out of their order in succession, but as animals are more noble than plants, we give them place and precedence. Doves have much emblematic significance, but all in keeping with the same series of sentiments. They appear constantly in ecclesiastical imagery, and are introduced in various religious rites. In some cases the living bird itself, and in others representations of it, have been made emblematic in ancient and in modern ceremonies. The introduction of this bird on a shield under a crest, in memorial of St. Catherine, is appropriate—for the doves suggest the patient and pure endurance attributed to that martyr. There are, we know, much more lofty imaginings which the religious history of the dove conveys, but we appropriate only its less solemn indications, and use them merely to portray human feeling. We may also glance at their mythological considerations, and remember

that these birds were the equipage of Venus; as they were chosen to draw the Queen of Love down to earth, they became emblems of her attributes, and remain dedicated to her, and the feelings of which she was the promoter and accredited patroness. The doves have always retained this attribute, for it was those with the flesh-coloured breast plumage that our own Shakspeare made to portray extremely affectionate gentleness in "Hamlet;" he makes the queen say—

"Anon as patient as the female dove,
When that her golden couplets are disclosed,
His silence will sit drooping."

Classical history, through Ælian and Tibullus, tells that doves delivered oracles in the forests of Dodona; this story might associate them with the wheel emblem of the goddess of wisdom; but as it would be rather a severe kind of duty to impose on the messengers of Cytheræ, we shall not dwell on it further.

We now come to the flowers on the shield—the fleurs-de-lis, or, as they have been read, fleurs-de-lis; these appear "Or"—in gold, the nearest metallic colour, and they are the well-known showy yellow iris, or flag lily of all our marshes. To adapt this plant as the heraldic flower of the French nation, when under the Bourbon dynasty, the derivation of its name was made arbitrarily to be from "fleur de St. Louis," and fleur-de-lis was adopted as its abbreviation; but an origin of its name from its fine showiness, "fleur de-lis"—a delighting flower, is more applicable, and possesses the universality of meaning proper to a plant which is very generally distributed, and is not at all limited to the decoration of wild nature in France. The classical history of our plant tells us that its "deliciousness" was sufficient to induce Juno Matrix, when nursing the infant Mars, to delight his young godship with it. The Queen of Olympus holds it in her royal hand during that pleasing time of royalty. Shakspeare also introduces it in its Gallic symbolism, when he makes King Henry V. pronounce it so doubtfully in a love question to his foreign love, that the French lady, Catherine, coquets a little, and pretends not to understand him; the king says, "What sayest thou, my fair flower-de-luce?" and she replies archly, "I know not dat;" however, they soon understood this much of the language of flowers. But elsewhere Shakspeare, true to nature and observation, gives to this plant its due English habitat from his memory, when he describes a garland thus, in the "Winter's Tale:"—

"Lilies of all kinds, the flower-de-luce being one."

And although the pretty Perdita who wreathed the flowers was a Bohemian maiden, the flower-de-luce was presented to our poet's observation in his own England. Spenser too, in his melodious stanzas, sings of this strikingly handsome wild flower as follows:—

"The lily, lady of the flowering field,
The flower-de-luce her lovely paramour,
Bid thee to them the fruitless labours yield,
And soone leave off this toilsome weary stoure;
Loe! loe! how brave she decks her bounteous bow'r,
With silken eurtains and gold coverlets,
Therein to shroude her sumptuous belamour;
Yet neither cards nor spins, ne cares nor frets,
But to her mother Nature all her care she lets."

There could be much more gathered to give to our iris poetical and legendary position, and that too as an heraldic armorial bearing, but my purpose is merely to show what might be done in readings of heraldry, I need not exhaust this subject. But I hope I have by this time succeeded in showing that heraldry has its history and its poetry; that formerly it was not held to be an idle, arbitrary, and incongruous agroupment of monstrous distortions, but was intended to convey a mind and a meaning when investigated and displayed. If other persons who have access to heraldic history would seek to unravel this blazonry, there can be no doubt that the reading of these pictorial rebuses might afford many pleasant pages in mediæval literature.

It is in this view—and with this hope—these remarks have been offered to the reader; and the writer will be largely rewarded if it be his good fortune to draw attention to the subject, and induce its consideration in the light he has attempted to supply.

RICHARD DOWDEN (RICHARD).

RATH-LEE, CORK.

* The chevron which supports the shield, in heraldry, is generally a well understood part of the armature, and is in heraldry called "a common ordinary;" but as some readers may not like the trouble of learning its meaning, it may be noticed here that it is intended to represent two rafters in the roof of a building—VΛ: it indicates sustentation or support, and assumes competent stability in a house or family which can show or produce "a chevron proper."

THE ART-UNION OF LONDON.

THE Prize Exhibition of the Art-Union of London was opened on the ninth of last month with a catalogue of one hundred and fifty-nine works, of which thirty-six are in water-colour. The highest prize, of the value of 200*l.*, was Hering's picture from the British Institution, 'Old Bridge near Pella, Piedmont,' the next, of the value of 150*l.*, is, 'Shades of Autumn,' by A. W. Williams; those of 100*l.* are—'Streatley Mill, on the Thames,' a 'Summer's Noon,' H. J. Boddington; 'On the Conway, Caernarvonshire,' H. B. Willis; 'Loch Long,' G. Cole; and 'The Mid-day Meal,' H. B. Willis. Of the value of 75*l.* there are four prizes—'The Weald of Sussex—Chancetonbury Downs in the Distance,' G. Cole; 'The Hotel de Ville, Brussels,' W. Callow, a water-colour drawing; 'Oyster-Dredging off the Mumbles' Head,' E. Duane, also in water-colour; 'The Town of Cochem, on the Moselle—Wimberg Castle in the Distance,' V. Cole. Of the value of 60*l.* there are ten prizes, and all the others are below that amount. As we have seen and have already noticed the best of the works in this selection—although many of them look better than they did in the positions from which they have been removed—it is not necessary to re-examine them; we may mention, however, some of the most meritorious of those that have been chosen. Besides those already named there are—'Bianca'—The Taming of the Shrew, F. S. Cary; 'A River-Bit, North Wales,' J. Dearle; 'A Summer's Morning, North Wales,' H. J. Boddington; 'Dean Swift and the Messenger,' T. P. Hall; 'Cottages at Pyrford, Surrey,' F. W. Hulme; 'Near Coniston, Cumberland,' J. F. Hardy; 'Sunny Moments,' F. W. Hulme; 'The Deer Park,' H. Jutsum; 'Shades of Autumn,' Alfred W. Williams; 'Swaledale,' J. Peel; 'Scene from the Gentle Shepherd,' W. Underhill; 'Moor Sabod, from near Brynattyreh, North Wales,' F. W. Hulme; 'Trellis Vine on the Lake of Lugano, North Italy,' W. W. Fenn; 'A Bright Day on the Thames,' J. Dearle; 'A Favourite Retreat, North Wales,' F. W. Hulme; 'Medmenham Abbey, on the Thames—Summer Evening,' H. J. Boddington; 'On the Brook, Vale Pengwern, North Wales,' P. Deakin; 'A Farm Pond,' J. Stark; 'A Somersetshire Lane, near Bristol,' G. Fripp; 'The Passing Cloud,' E. G. Warren; 'Summer Shade,' E. G. Warren; 'The Homestead,' C. Davidson, &c. Thus the bulk of the selections are landscape, and many that we have not mentioned are inferior in quality. Having seen what is, and has been, done by another similar institution—the Glasgow Art-Union—we cannot think the plan still pursued by the London Art-Union works well—that of confiding the selection of the works to the taste and judgment of the prizeholders. The figure pictures are few; none approach a high tone of didactic sentiment, and they bear an insignificant proportion to the number of mediocre landscapes. We should not have been led to make these observations, but that the Exhibition of the Glasgow Art-Union shows that it is not only not impossible, but that it is easy, to procure productions of high class. We have had some experience in counselling prizeholders, and we have generally found that in their eyes the *largest* picture at a given value was always considered the best. We have watched carefully every exhibition, from the foundation of the institution in 1837, and know that a lengthy catalogue of low class painters speculate in works for prizeholders, and generally succeed in disposing of them. It is not the intention of the institution to foster, year after year, Art deficient of all promise. We do not wish to be unduly harsh, but it is necessary to be just; we can point to the works, in this exhibition, of artists who, though without reputation as painters, are in sufficiently easy circumstances—a tolerably prosperous condition of life, accomplished by means from which men of real talent would shrink. It is not our purpose to go into any analytical comparison of the results effected by the two institutions, but we cannot help mentioning one fact, which is, that while the Art-Union of London purchases pictures to the amount of only 6440*l.*, the Art-Union of Glasgow expends 7990*l.* The plates for the ensuing year will be 'The Piper,' engraved by Mr. E. Goodall, after the picture of that title by F. Goodall, A.R.A., and 'The Clemency of Cœur-de-Lion,' engraved by

Mr. Shentou from Cross's picture, which it will be remembered was exhibited at Westminster Hall during the competitions for the decoration of the Houses of Parliament; and for a future year a series of wood-engravings from the best pictures of deceased British artists are under the superintendence of W. J. Linton. It cannot be doubted, if these are judiciously selected, this last will be a work of much interest. An arrangement has been entered into with the Etching Club for a volume of etchings. The works of that society are always of high merit; this, therefore, may be earnestly looked forward to. In addition to the pictures, the distribution comprehended also eleven bronzes of 'Her Majesty on Horseback,' five bronzes in relief of 'The Duke of Wellington Entering Madrid,' thirty iron vases, twenty porcelain statuettes—'The Stepping Stones,' fifty porcelain statuettes—'The Dancing Girl Reposing,' thirty-four porcelain busts—'Clytie,' forty silver medals of Flaxman, and thirty other medals, also silver, of Vauburgh. Of 'The Snapper Seue' there were five hundred lithographed impressions, and of 'Tyndale Translating the Bible,' two hundred and fifty mezzotint impressions. Examples of all these works are added to the exhibition, and many are admirable in execution.

THE GLASGOW ART-UNION.

THE prize pictures of the Art-Union of Glasgow are exhibited in the gallery of the Old Water-Colour Society, in Pall Mall East. It appears to be the policy of this society to exhibit their selection in certain of the principal towns of the kingdom, and being now located "next door" to the temporary abiding place of the prizes of the Art-Union of London, the collection of the northern society appears to great advantage, as far transcending the collection of the metropolitan institution. The number of pictures is two hundred and eight, among which are many works of a very high degree of merit. The first prize, of 400*l.*, is 'Conquered, but not subdued,' by Thomas Faed; the next, of 367*l.* 10*s.*, is a 'Landscape and Figures,' by Creswick and Ansdell; then follow a 'Highland Deer Forest, Isle of Skye,' 350*l.*, R. McCulloch; 'The Graces and the Loves,' W. E. Frost, A.R.A., 350*l.*; 'The Infant School in a Country Church,' R. McInnes, 250*l.*; 'Storm on a Highland Coast—Ben Blavon, Isle of Skye,' H. McCulloch, R.S.A., 200*l.*; 'Burns in Edinburgh, 1786,' W. Johnston, R.S.A., 200*l.*; 'The Kiosk—Lalla Rookh,' F. Wyburd, 200*l.*; 'Cottage Window,' R. Gavin, 150*l.*; 'Isola di San Guido—Lago d'Orta, Piedmont,' G. E. Hering, 150*l.*; 'Ye Lymmerie his Dreame,' E. H. Corbould, 150*l.*; 'Whew! caught again!' E. Nicol, A.R.S.A., 130*l.*; 'Summer Trophies,' J. Sant, 126*l.*, &c. &c. This selection must be unhesitatingly pronounced the best that has ever been exhibited by any Art-Union Society, inasmuch as it contains pictures which have done honour to the collections in which they have been shown, and many others which have never before been seen by the public—works that have been commissioned immediately from the artists, and transferred from their respective studios to the walls of the room in which they now hang. The first prize, 'Conquered, but not subdued,' by Faed, we have not before seen; it is a subject from cottage life, the unsuited one being a ragged barefooted urchin, who, for some unexplained misdemeanour, has been placed in the corner against the wall by his mother, who sits calmly peeling potatoes for the mid-day meal. The brother and sister of the delinquent are indulging in pleasures at his disgrace, which he fiercely threatens to avenge when an opportunity shall present itself. The figures are very intelligibly characterised. The whole is a triumph in expression; and the nicest balance prevails throughout the composition. The cottage is a reality, not overdone with furniture and utensils—there is space for the figures, and they have room to move. It is a production of a very high degree of merit; but we must confess some regret at seeing such an amount of labour bestowed on a subject which is comparatively worthless as an excitant of any wholesome emotion. Wilkie has had a thousand followers, but

he has yet far distanced every one. The 'Landscape and Figures,' by Creswick and Ansdell, is a large picture, a composition in which the painter of the landscape introduces a windmill—that which has already appeared in some of his recent works. It is an open composition, presenting a breadth of light—an effect not frequently painted by the artist. A shallow river occupies nearly the whole of the nearest section, in which a group of farm-horses have stopped to drink while passing the ford. The picture is marked "unfinished," we cannot, therefore, tell what final treatment it may be subjected to; but it can only be observed that it wants point, which will doubtless be communicated to it when again returned to the easel. The 'Girl at the Mountain Well,' by Sant, is a life-size half-length of extreme simplicity, the features being endowed with a quality of expression far above the level of a rustic drudge. The commonplace costume is most skillfully concealed by a piece of drapery, which in its turn is rendered unobtrusive by subdued colour—this art is fully understood by the painter. The other work by the same artist is 'Summer Trophies,' presenting a child in a sylvan retreat, busied with the Flora of the leafy wilderness. She has decorated her head with a coronal of poppies, and is further occupied in forming bouquets of a variety of wild flowers. This picture forms a striking contrast to the other, being full of colour, while the other is entirely without it. Another work which has not been exhibited is 'Homeward Bound,' by J. W. Carmichael. The subject is a transport off Gibraltar, apparently returning from the Black Sea. The rig and sailing of the vessel are beyond all praise; every rope and spar is in its place—indeed, we never see any marine subjects painted with such a knowledge of seamanship as the works of this artist. The movement and liquid depth of the water are strikingly real. 'The Crimean Story,' by Hugh Cameron, is the production of a painter whose works we have not before seen. The subject is a wounded soldier, returned from the scene of war, narrating his achievements to a small knot of wondering rustics. It is painted with a modesty rarely to be seen combined with so much talent. Among other works chosen by the society may be mentioned—'The Lym Spout, near Dalry,' H. McCulloch, R.S.A.; 'Birk Craig, near Harrowgate, Yorkshire,' George Stanfield; 'Sunshine and Showers,' H. Jutsum; 'French Interior,' Eliza Goodall; 'The Dancing Lesson,' R. T. Ross, A.R.S.A.; 'Ludlow Castle,' D. O. Hill, R.S.A.; 'A Woodland Pool,' B. Williams—a most careful study from nature. We must in conclusion observe of the Glasgow Art-Union, that its exhibitions have from the first been of a superior kind; and should the selections in years to come evince a proportionable degree of improvement, it must become the first institution of its class in the kingdom.

We record these opinions with a feeling akin to regret, for it is not pleasant to see the old society so effectually distanced by the new. But that such is the case is certain; and unless the Art-Union of London adopt some plan by which it may successfully compete with its rival, the result must inevitably be that Glasgow will receive the guineas of London. The evil—if evil it be—is very greatly enhanced by the fact that the two exhibitions are so near each other, that visitors to one will visit both, and the contrast between the strength of the one and the weakness of the other cannot fail to produce a prejudicial effect upon the interests of the Art-Union of London. If it be wisdom to "learn to be wise by others' harm," it is surely wise to imitate or to follow the excellences of which we have experience. During many years past we have been endeavouring to induce the Art-Union of London to appoint a committee of selection, if not of the whole, certainly of a part of their purchases. We say again, emphatically, "to this conclusion they must come at last." The earnest gratitude of the artists, and, indeed, of the community, is due to the Committee of the London Art-Union, and especially to its earnest and indefatigable secretaries: but they must advance—they must introduce those improvements of the value of which they have indisputable evidence "close at hand."

Much that is good has been done—and well done; but the time has arrived when a review of the constitution of the Art-Union of London is necessary to its existence.

THE CRYSTAL PALACE,

AS A TEACHER OF ART AND ART-MANUFACTURE.

PART III.

THE several Art-Courts are certainly advancing, although still very incomplete; that of Sheffield, to which we directed attention in the second part of this series, is now much more perfect than it has been: the cases are all full, and a statue emblematic of the town—the work of a native sculptor—occupies the centre, and has a very striking and agreeable effect; it is also a production of considerable merit. The Birmingham Court is by no means satisfactory. It was our intention to have treated this subject in our present number; we postpone this duty, however, in hopes of a better arrangement—by which we may be enabled to do justice to this great city of the most important branch of British Art-manufacture. If Birmingham be not fully represented by its manufacturers—who are numerous and powerful, and who can do much to uphold and extend its repute—its fame is at all events amply sustained by the now eminent firm of Elkington and Mason; to their extensive and admirable collection we shall have chiefly to refer when we treat an always interesting and important subject—the produce and manufacture of Birmingham.

That we have now to bring under notice, is the STATIONERY COURT, which, indeed, contains no very large assemblage of Art-works, but which is in itself a very elegant construction. It was designed and erected by J. G. Crace; “the style is

composite, and may be regarded as the application of cinque-cento ornamental decoration to a wooden structure;” so at least says the guide-book. It has no pretensions to architecture of a pure order, but produces a good effect, and is undoubtedly a light and graceful erection, well suited to the purpose intended. “Over the opening through which we enter, and between the stained glass windows let into the wall, have been introduced allegorical figures of the Arts and Sciences applied to the manufacture of the articles exhibited in the Court; and over the opening at the back, the artist has depicted the genii of Manufacture, Commerce,” &c. The interior walls of the Court are divided, in the upper portions, into panels; these have a ground-work of white colour, and borders of a deep morone, richly decorated with designs in gold; in the centre of each is a medallion, on which are represented Cupidons, engaged in one of the various mechanical and scientific arts having reference to paper, printing, engraving, &c.: the spaces between the compartments are of a rich blue colour, also decorated with patterns in gold. The ceiling—or what is presumed to be such, for, as in all the Courts, a part only stands for the whole—is supported by deep projecting beams, very light in construction, and having the form of pendants; they are painted in imitation of dark oak, the mouldings being picked out with gold and colours. Above each of the compartments or panels is a small panel, running horizontally, and of a blue ground, to harmonise with the intermediate upright panels alternating with the others. This Court, as its name indicates, contains examples of ornamental painting, fancy

stationery, drawing, specimens of chromo-lithography, photographs, and all the varied requirements of the writing-desk. The most striking object in this Court is, however, the stereoscope stand, in carved box-wood, the work of Mr. Rogers, executed for Mr. Claudet, and exhibited here by him. It was one of the most meritorious of British contributions to the Exhibition in Paris, but there obtained comparatively little notice among so many “matters more attractive;” placed where it now is, it can be seen to advantage. The general design of this work is by Mr. W. Harry Rogers; the architectural details having been supplied by Mr. Charles Barry. The height is about seven feet and a half: it is in the purest Italian style, as will be shown by the engravings of two of the panels, printed on the succeeding page. The form is hexagonal. As an example of wood carving, it has been rarely surpassed; and although used for the purpose of exhibiting the stereoscopic views of Mr. Claudet, there are few productions of modern Art which surpass this in merit.

Among the principal contents of the Court which will attract the notice of the visitor, we may mention a large ornamental case that stands in the centre,—it contains specimens of all kinds of useful and ornamental stationery, exhibited by Messrs. Waterlow and Sons; another large and elegantly arranged case of articles in papier maché, by Messrs. Spiers and Son, of Oxford; numerous examples of chromo-lithographic prints, by Messrs. Hanhart, and Messrs. Rowney and Co.; a number of specimens of Owen Jones’s forthcoming work, “The Grammar of Ornament,” printed by Messrs. Day and Son; a

THE STATIONERY COURT, CRYSTAL PALACE.

variety of Baxter’s examples of printing in oil-colours; bookbinding by Mr. J. Leighton, and Messrs. Leighton, Son, and Hodge; water-colours and drawing materials of every description, by Messrs. Rowney and Co.; maps of the Ordnance Survey, &c. &c. The varied and pleasing character of the contributions to the Stationery Court cannot fail to invite attention.

Behind the Stationery Court, but connected with it by one of the entrances, are several collections of value; the passage which contains them, indeed,

runs the whole length of the three Courts, that of Birmingham, that of Sheffield, and that under immediate notice; while on the opposite side are large apartments, fitted up and occupied by Messrs. Benham and Sons for stoves and ranges, Messrs. T. H. Filmer for household furniture, Messrs. Crace for church furniture, from the designs of Mr. Shaw, and other objects of less importance. The passage should be examined carefully, for here the visitor will find many works of merit,—such as the cast-iron of Messrs. Kennard; the inlaid tables, pillars, &c.,

of Mr. Stevens; the Cornish Serpentine vases, chimney-pieces, &c., exhibited by the London and Penzance Serpentine Company; the Matlock specimens of Mr. Smedley; monuments, vases, chimney-pieces, balconies, &c., of Ransome’s patent siliceous stone; iron and brass door furniture of Messrs. Hart and Son; the patent Derbyshire stone-ware of Messrs. Bourne and Son, &c. &c., with a collection of works in terra-cotta, the manufacture of Mr. Blashfield, which we shall be hereafter called upon to notice more at length.

The group we introduce upon this page is from a variety of striking productions, contributed by ZIMMERMAN, of Frankfort, and manufactured by him at his famous establishment, situated a few miles from that great city. The works are all in cast-iron; but it will be by no means at once apparent that they are of the inferior metal; being generally coloured to imitate bronze, for which they may be easily mistaken. They are singularly sharp and clear, and exhibit skill in casting which we believe to be unrivalled, although the castings of Liege, of Paris (André), and Colebrooke Dale, are of great excellence. Certainly, in such minor utilities as those we have selected for engraving, there are none that rival the productions of the factory of M. Zimmerman. We had the pleasure to visit it about four years ago, and personally examined the several processes through which the iron passed. By a judicious overlooking of very skilful workmen these effects are pro-

duced, which the visitor will do well to examine, giving to iron almost the value of more costly

stands, wafer boxes, envelope cases, &c.; and these we have selected for engraving, together with one of the miniature mirrors, of which there are many of a very pleasing and striking character. We have not engraved any of the statuettes, although, perhaps, these are the more extraordinary productions of the factory. They will be mistaken for bronze by nine-tenths of those who examine them, until very carefully looked into, and even then the result will be by no means unsatisfactory. Several of them are scattered about the Stationery Court; others will be found in the Birmingham Court; while those of a more ordinary character are placed for sale in the north gallery. M. Zimmerman has also an establishment in the Strand; and the circulation of his productions, rendered accessible to all classes, will certainly contribute to elevate taste and promote enjoyment among those who covet such productions of Art as circumstances place beyond their reach.

frequently there is evidence of thought and originality; the best are those which are auxiliaries to the writing-table—inkstands, almet cases, candle-

tribute to elevate taste and promote enjoyment among those who covet such productions of Art as circumstances place beyond their reach.

THE CAST-IRON WORKS OF ZIMMERMAN, OF FRANKFORT.

We resume our notice of the CERAMIC COURT: it is, indeed, the only one of the Art-Courts that may be considered and described as complete, and, because of its interest and importance, our readers will expect that we treat it frequently and at length. Our comments on the other Courts are made less as reports than as inducements. We desire to see them receive that completeness which at present they are without, but the necessity for which, we trust, will be perceived by the leading manufacturers in the several localities which ought to be, and may be, duly and properly represented. The Ceramic Court, however, leaves us nothing to desire, unless it be a larger exhibition of modern works, the productions of existing British manufacturers. We are

well aware that Mr. Battam finds difficulties in this respect; of a surety the second class producers of porcelain and earthenware do not produce much that will not sadly "dwindle" beside the produce of old Dresden, old Sevres, old Chelsea, and old "Wedgwood;" but there are not many of them who can contribute nothing worthy: a few really good works may be sent by nearly every manufacturer in Staffordshire: these should be sought for, sent, and exhibited; and Mr. Battam will not have properly finished his allotted task until this be done. We rejoice to know that the Ceramic Court has attracted universal attention; it is thronged daily, not alone by admiring, but by studious, groups: the productions of Minton, Copeland, and Kerr and Binns, excite ad-

miration equal to their deserts,—and that is saying much. Undoubtedly the result has been to elevate British Ceramic Art in public estimation, and to convince the most accomplished connoisseur that England in the nineteenth century need fear nothing in competition with France and Germany of the same epoch, although perhaps our recent productions fall short of those of a century ago, as much as do those of Dresden and Sevres in comparison with their exquisite produce during their high and palmy days.

We have to announce the receipt of further loans of great value and importance. The co-operation which Mr. Battam has received from the possessors of many valuable collections fully evidences the interest

felt in the success of this exhibition. Indeed, offers of loans have been made beyond the capacity of the space now at disposal. These will remain available for a future opportunity, and thus secure a permanent and varied attraction. We have great pleasure in adding to the list we have already given of those who have so kindly and liberally placed their "fragile treasures" at the service of the Exhibition. His Grace the DUKE OF DEVONSHIRE has furnished some valuable specimens of Chinese and Japanese porcelain, together with some fine examples of Sèvres.

LADY MOLESWORTH has also generously lent a valuable series of Dresden, Capo de Monte, and Chelsea porcelain. We would draw special attention to the group of the "Grecian Daughter," and the statuettes of the Seasons, of old Chelsea porcelain, which may well sustain comparison with the Dresden productions of that class. A statuette of Bacchus, of the Nymphenburg manufacture, from the same collection, is a remarkably fine work. There are also some excellent examples of bird-painting upon the Dresden specimens. SIR GARDNER WILKINSON has lent a most interesting series, illustrating the pottery of

ancient and modern Egypt, early Etruscan, from Chiusi (ancient Clusium), Samian ware, &c.

The examples of Egyptian ware are further enriched by a number of specimens of that manufacture lent by ARTHUR ANDERSON, Esq., who has likewise added some specimens of early Peruvian, of considerable interest.

We now proceed in detail to notice the exhibition of the modern manufacture, and in the present number illustrate some of the most remarkable productions of MR. ALDERMAN COPELAND's famous works. We have frequently had occasion, in commenting upon the progress of the Staffordshire potteries, to refer to the great excellence of the different class of wares emanating from this manufactory, which has exercised so marked an influence in creating and extending the fame of English Ceramic Art.

The specimens in this exhibition exemplify very fully and successfully the various branches which this celebrated manufactory includes in the wide sphere of its operation. The range is very comprehensive. We have here a large collection of vases

of various sizes and design—one of immense magnitude—panels for fireplace coverings, statuettes, groups, dessert baskets, &c., in statuary porcelain; many examples of the beautiful jewelled ware (a special feature of this exhibition), in vases, tazzi, and specimens of the service in possession of her Majesty. To this last must be added an elegant assortment of *jardinières*, conservatory vases and pillars, toilet ware, and an assortment of the ordinary printed ware. In one branch of Art, and that of a most important character, this house has unquestionably stood pre-eminent. We refer to the manufacture of statuary porcelain, which has since given rise to so many imitations. While for many years these works were under the Art-direction of Mr. Battam, the productions of such artists as Gibson, R.A., Wyatt, R.A., Foley, R.A., Marshall, R.A., Theed, Durham, Papworth, &c., were published; thus not only elevating the standard of the productions of this manufactory, but also exercising a most valuable and stimulating influence upon the exertions of others in the trade. The co-operation of artists of such eminence has been most valuable, both directly and indirectly. Not

GROUP OF WORKS IN PORCELAIN: MR. ALDERMAN COPELAND.

only has the branch of Art with which they were immediately connected been raised to a high position in Art-manufacture, but this success has induced an improvement in the general production, and has in a considerable degree tended to arouse that feeling of honourable rivalry which has given so valuable an impulse to the exertions of the pottery districts.

Nor while referring to this subject, should the value of the encouragement given by the Art-Union of London be forgotten or under-estimated. To this society the Ceramic Art of England is largely indebted. At a time when the manufacture of the statuary porcelain was struggling into publicity—when those who should have been the foremost to recognise the value and importance of such an adjunct to the manufacture, were blind and indifferent to its merits, the Art-Union of London at once

acknowledged them, and gave such encouragement by their commissions as finally stamped the invention with a complete success. To this society the credit of fostering, by early patronage, a branch of Art which has since become so important, both in its artistic and industrial relation to English manufacture, is eminently due. The works executed for this society by Mr. Alderman Copeland have been from the models of Gibson, Marshall, Foley, and the antique.

Amongst the examples of statuary porcelain are three remarkably fine busts, life-size, of Clitiae, Juno, and Ariadne, from the antique. As works of pottery they are extraordinary productions; and, considering the many difficulties attending the manufacture—including a contraction of nearly one fourth in the dimensions consequent upon the process of "firing"—their perfection is astonishing. With such illustra-

tions as these as to the capabilities of this material, we look for its application in a variety of ways not hitherto developed.

The designs on the panels for fireplace coverings are of varied character, all in good taste and admirable in point of execution. This branch has of late years become most important as a trade demand, and appears still increasing. We have on former occasions detailed the peculiar fitness of this material for the purpose, not only as regards the facility it offers for decoration in conformity with the style of room in which the stove is fixed, but also for its durability, and the economy of labour which its surface offers as to cleanliness, in comparison with that of metal. Among the most remarkable of the works exhibited is the great Alhambresque Vase, so prominent a feature in the Paris Exhibition last year. This vase,

upwards of five feet high, and fired in one piece, is a most important achievement, and proves the perfection to which the manufacture has been wrought.

Two large vases, *gros bleu*, and Grecian design in gold, are also of great excellence; the blue grounds

are remarkable for quality and uniformity of tint, and challenge comparison with some of the best examples of Sèvres.

A large vase of Etruscan form, with garlands of flowers and ornamentation in blue and gold, is of extremely good character, and had the flower-painting been less heavy in tone and execution, it would have been a perfect work.

The specimens we have engraved exhibit several varieties of the works of Mr. Alderman Copeland: we do not pause to describe them; they will be recognised in the cases, and their value and beauty appreciated.

It may be observed, that the engravings on this page are repetitions of some which have on previous occasions been introduced to the readers of this

Journal; but inasmuch as they are the most prominent and meritorious of the works exhibited by Mr. Alderman Copeland, and as all who visit the Ceramic Court will expect to see them pictured in this report of its contents, it would disappoint the visitors, and be unjust to the manufacturer, if they were on this occasion omitted.

We must refer in terms of great praise to several specimens of the *common printed ware* of the manufactory, as it is in this branch that so great an amount of good may be done in the advancement of public taste. We have patterns here which, from the style of design and quality of manufacture, are of the very highest merit, and produced at about

the same price as the execrable willow pattern. Indeed, some of the designs are of such a character as to satisfy the most exacting taste; and yet we are grateful to record that they have been generally popular in an unusual degree, the sales having been very great and continuous. This augurs well, and should induce persistence in such a course, alike creditable to producers and consumers.

We shall have occasion in a future number to refer to the productions of other manufacturers, several of whom are now sending in examples, and of others who have solicited space for works they

are expressly engaged upon for exhibition in this Court—the Ceramic Court of the Crystal Palace.

The importance of such a medium of publicity is now fully acknowledged, and the exhibitive space

will have to be enlarged to include all who desire and deserve to avail themselves of its advantages.

THE MONKS OF THE MIDDLE AGES.

BY THE REV. EDWARD L. CUTTS, B.A.

OUR business in the present article is to give a sketch of the monks of the middle ages, so far as Art is concerned with them. One branch of this subject has already been treated in Mrs. Jamieson's "Legends of the Monastic Orders." This accomplished lady has very pleasingly narrated the traditionary histories of the founders and saints of the orders, which have furnished subjects for the greatest works of Mediæval Art; and she has placed monasticism before her readers in its noblest and most poetical aspect. Our humbler aim is to give a view of the familiar daily life of ordinary monks in their monasteries, and of the way in which they enter into the general life without the cloister;—such a sketch as an Art-student might wish to have who is about to study that picturesque mediæval period of English history for subjects for his pencil; and who is aware that the religious orders occupied so important a position in middle-age society, that they cannot be overlooked by the historical student; and who feels that the flowing black robe and severe intellectual features of the Benedictine monk, or the coarse frock and sandalled feet of the mendicant friar, are too characteristic and too effective, in contrast with the gleaming armour and richly-coloured and embroidered robes of the sumptuous civil costumes of the period, to be neglected by the artist. Such a student would desire first to have a general sketch of the whole history of monachism, as a necessary preliminary to the fuller study of any particular portion of it. He would wish for a sketch of the internal economy of the cloister;—how the various buildings of a monastery were arranged, and what was the daily routine of the life of its inmates. He would seek to know under what circumstances these recluses mingled with the outer world. He would require accurate particulars of costumes and the like antiquarian details, that the accessories of his picture might be correct. And, if his monks are to be anything better than representations of monkish habits hung upon lay figures, he must know what kind of men the middle age monks were intellectually and morally. These particulars we proceed to supply as fully as the space at our command will permit.

Monachism arose in Egypt. As early as the second century we read of men and women who, attracted by the charms of a peaceful contemplative life, far away from the fierce, sensual, persecuting heathen world, betook themselves to a life of solitary asceticism. The mountainous desert on the east of the Nile valley was their favourite resort; there they lived in little hermitages, rudely piled up of stones, or hollowed out of the mountain-side, or in the cells of the ancient Egyptian sepulchres, feeding on pulse, and herbs, and water from the neighbouring well.

One of the frescoes in the Campo Santo, at Pisa, by Pietro Laurati, engraved in Mrs. Jamieson's "Legendary Art," gives a curious illustration of the eremitical life. It gives us a panorama of the desert, with the Nile in the foreground, and the rock caverns, and the little hermitages built among the date-palms, and the hermits at their ordinary occupations: here is one angling in the Nile, and another dragging out a net; there is one sitting at the door of his cell shaping wooden spoons; and here, again, we see them engaged in those mystical scenes in which an over-wrought imagination pictured to them the temptations of their senses in visible demon shapes—beautiful to tempt or terrible to affright; or materialised the spiritual joys of their minds in angelic or divine visions: Anthony driving out with his staff the beautiful demon from his cell, or wrapt in ecstasy beneath the Divine apparition.* Such pictures of the early hermits are not infrequent in mediæval art: there is a good small one in a fifteenth-century Psalter MS. in the British Museum. (Domit A., xvii. f. 84, C.)

* There is no need to put down all these supernatural tales as fables or impostures—spiritual excitement induces such appearances to susceptible natures; similar tales abound in the lives of the religious people of the middle ages, but they are not unknown in modern days: Luther's conflict with Satan in the Wartburg, to wit; and Colonel Gardiner's vision of the Saviour.

We can picture to ourselves how it must have startled the refined Græco-Egyptian world of Alexandria when occasionally some man, long lost to society and forgotten by his friends, reappeared in the streets and squares of the city, with attenuated limbs and mortified countenance, with a dark hair-cloth tunic for his only clothing, with a reputation for exalted sanctity and spiritual wisdom, and vague rumours of supernatural revelations of the unseen world; like another John Baptist preaching repentance to the luxurious citizens; or fetched, perhaps, by the Alexandrian bishop to give to the church the weight of his testimony to the ancient truth of some doctrine which began to be questioned in the schools.

Such men, when they returned to the desert, were frequently accompanied by numbers of others, whom the fame of their sanctity and the persuasion of their preaching had induced to adopt the eremitical life.

It is not to be wondered at that these new converts should frequently build or select their cells in the neighbourhood of that of the teacher whom they had followed into the desert, and should continue to look up to him as their spiritual guide. Gradually, this arrangement became systematised; a number of separate cells, grouped round a common oratory, contained a community of recluses, who agreed to certain rules and to the guidance of a chosen head; an enclosure wall was generally built around this group, and the establishment was called a *laura*.

The transition from this arrangement of a group of anchorites occupying the anchorages of a *laura* under a spiritual head, to that of a community living together in one building under the rule of an abbot, was natural and easy. The authorship of this cenobite system is attributed to St. Anthony, who occupied a ruined castle in the Nile desert, with a community of disciples, in the former half of the fourth century. The cenobitical institution did not supersede the eremitical, both continued to flourish together in every country of Christendom. The first written code of laws for the regulation of the lives of these communities was drawn up by Pachomius, a disciple of Anthony's. Pachomius is said to have peopled the Island of Tabenne, in the Nile, with cenobites, divided into monasteries, each of which had a superior, and a dean to every ten monks; Pachomius himself being the general director of the whole group of monasteries, which are said to have contained eleven hundred monks. The monks of St. Anthony are represented in ancient Greek pictures with a black or brown robe, and often with a tau cross of blue upon the shoulder or breast.

St. Basil, afterwards Bishop of Cesarea, who died A.D. 378, introduced monachism into Asia Minor, whence it spread over the East. He drew up a code of laws founded upon the rule of Pachomius, which was the foundation of all succeeding monastic institutions, and which is still the rule followed by all the monasteries of the Greek church. The rule of St. Basil enjoins poverty, obedience, and chastity, and self-mortification. The habit both of monks and nuns was, and still is, universally in the Greek church, a plain, coarse, black frock with a cowl, and a girdle of leather, or cord. The monks went barefooted and barelegged, and wore the Eastern tonsure, in which the hair is shaved in a crescent off the fore part of the head, instead of the Western tonsure, in which it is shaved in a circle off the crown. Hilarion is reputed to have introduced the Basilican institution into Syria; St. Augustine into Africa; St. Martin of Tours into France; St. Patrick into Ireland, in the fifth century.

The early history of the British church is enveloped in thick obscurity, but it seems to have derived its Christianity from an Eastern source, and its monastic system was probably derived from that established in France by St. Martin, the abbot-bishop of Tours. One remarkable feature in it is the constant union of the abbatial and episcopal offices; this conjunction, which was foreign to the usage of the church in general, seems to have obtained all but universally in the British, and subsequently in the English church. The British monasteries appear to have been very large; Bede tells us that there were no less than two thousand one hundred monks in the monastic establishment of Bangor at the time of St. Augustine's connection with it, in the sixth century, and there is reason to believe that

the number is not overstated. They appear to have been schools of learning. The vows do not appear to have been perpetual; in the legends of the British saints we constantly find that the monks quitted the cloister without scruple. The legends lead us to imagine that a provost, steward, and deans, were the officers under the abbot; answering, perhaps, to the prior, cellarer, and deans of Benedictine institutions. The abbot-bishop, at least, was sometimes a married man.

In the year 529 A.D., St. Benedict, an Italian of noble birth and great reputation, introduced into his new monastery on Monte Cassino—a hill between Rome and Naples—a new monastic rule. To the three vows of obedience, poverty, and chastity, which formed the foundation of most of the old rules, he added another, that of manual labour (for seven hours a day), not only for self-support, but also as a duty to God and man. Another important feature of his rule was that its vows were perpetual. And his rule lays down a daily routine of monastic life in much greater detail than the preceding rules appear to have done. The rule of St. Benedict speedily became popular, the majority of the existing monasteries embraced it; nearly all new monasteries for centuries afterwards adopted it; and we are told in proof of its universality of acceptance, that when Charlemagne caused inquiries to be made about the beginning of the eighth century, no other monastic rule was found existing throughout his wide dominions. The monasteries of the British church, however, do not appear to have embraced the new rule.

St. Augustine, the apostle of the Anglo-Saxons, was prior of the Benedictine monastery which Gregory the Great had founded upon the Celian Hill, and his forty missionaries were monks of the same house. It cannot be doubted that they would introduce their order into those parts of England over which their influence extended. But a large part of Saxon England owed its Christianity to missionaries of the native church still flourishing in the west and north; and these would doubtless introduce their own monastic system. We find, in fact, that no uniform rule was observed by the Saxon monasteries; some seem to have kept the rule of Basil, some the rule of Benedict, and others seem to have modified the ancient rules, so as to adapt them to their own circumstances and wishes. We are not surprised to learn that under such circumstances some of the monasteries were lax in their discipline; from Bede's accounts we gather that some of them were only convents of secular clerks, bound by certain rules, and performing divine offices daily, but enjoying all the privileges of other clerks, and even sometimes being married. Indeed, in the eighth century the primitive monastic discipline appears to have become very much relaxed, both in the East and West, though the popular admiration and veneration of the monks was not diminished.

In the illuminations of Anglo-Saxon MSS. of the ninth and tenth centuries, we find the habits of the Saxon monks represented of different colours, viz., white, black, dark brown, and grey.* In the early MS. Nero, C. iv., in the British Museum, at folio 37, occurs a very nice group of monks in white habits; another group occurs at folio 34, rather more stiffly drawn, in which the margin of the hood and the sleeves is bordered with a narrow edge of ornamental work.

About the middle of the ninth century, however, Archbishop Dunstan reduced all the Saxon monasteries to the rule of St. Benedict, not without opposition on the part of some of them, and not without rather peremptory treatment on his part: and thus the Benedictine rule became universal in the West. The habit of the Benedictines consisted of a white woollen cassock, and over that an ample black gown and a black hood. We give here an excellent representation of a Benedictine monk, from the book of St. Albans, in the British Museum (Nero D. vii. f. 81); he is represented as holding a golden tankard in one hand and an embroidered cloth in the other, gifts which he made to the abbey, and for which he is thus immortalised in their *Catalogus Benefactorum*. In working and travelling they wore over the cassock a black sleeveless tunic of shorter and less ample dimensions.

* Strutt's "Dress and Habits of the People of England."

The female houses of the order had the same regulations as those of the monks; their costume too was the same, a white under garment, a black gown, and black veil, with a white wimple around the face and neck. They had in England, at the dissolution of the monasteries, one hundred and twelve monasteries and seventy-four nunneries.*

The Benedictine rule had now been all but universal in the West for four centuries; but during this period its observance had gradually become relaxed. We cannot be surprised if it was found that the seven hours of manual labour which the rule required, occupied time which might better be devoted to the learned studies for which the Benedictines were then, as they have always been, distinguished. We should have anticipated that the excessive abstinence, and many other of the mechanical observances of the rule would soon be found to have little real utility. We are not therefore surprised, nor should we in these days attribute it as a fault, that the obligation to labour appears to have been very generally dispensed with, and that some humane and sensible relaxations of the severe ascetic discipline and dictary of the primitive rule had also been very generally adopted. Nor will any one who has any experience of human nature, expect otherwise than that among so large a body of men—many of them educated from childhood to the monastic profession—there would be many who were wholly unsuited for it, and whose vices brought disgrace upon it. The Benedictine monasteries, then, at the time of which we are speaking, had become different from

BENEDICTINE MONK.

the poor retired communities of self-denying ascetics which they were originally. Their general character was, and continued throughout the middle ages to be, that of wealthy and learned bodies; influential from their broad possessions, but still more influential from the fact that nearly all the literature, and art, and science of the period was to be found in their body. They were good landlords to their tenants, good cultivators of their demesnes; great patrons of architecture, and sculpture, and painting; educators of the people in their schools; healers of the sick in their hospitals; great almsgivers to the poor; freely hospitable to travellers; they continued regular and constant in their religious services; but in housing, clothing, and diet, they lived the life of temperate gentlemen rather than of self-mortifying ascetics. Doubtless, as we have said, in nearly every monastery there were some evil men, whose vices brought disgrace upon their calling; and there were some monasteries in which weak or wicked rulers had allowed the evil to prevail. The quiet, unostentatious, every-day virtues of such monasteries as these were perhaps not such as to satisfy the enthusiastical seeker after monastical perfection. Nor were they such as to command the admiration of the unthinking and illiterate, who are always more prone to reverence fanaticism than to appreciate the more sober virtues; who are ever inclined

to sneer at religious men and religious bodies who have wealth; and are accustomed to attribute to a whole class the vices of its disreputable members.

The popular disrepute into which the monasteries had fallen through their increased wealth, and their departure from primitive monastical austerity, led, during the next two centuries, viz., from the beginning of the tenth to the end of the eleventh, to a series of endeavours to revive the primitive discipline. The history of all these attempts is very nearly alike. Some young monk of enthusiastic disposition, disgusted with the laxity and the vices of his brother monks, flies from the monastery, and betakes himself to an eremitical life in some neighbouring forest or wild mountain valley. Gradually a few men of like earnestness assemble round him. He is at length induced to permit himself to be placed at their head as their abbot; requires his followers to observe strictly the ancient rule, and gives them a few other directions of still stricter life. The new community gradually becomes famous for its virtues; the Pope's sanction is obtained for it; its followers assume a distinctive dress and name; and take their place as a new religious order. This is in brief the history of the successive rise of the Clugniacs, the Carthusians, the Cistercians, and the orders of Camaldoli and Vallombrosa and Grandmont; they all sprang thus out of the Benedictine order, retaining the rule of Benedict as the groundwork of their several systems. Their departures from the Benedictine rule were comparatively few and trifling, and need not be enumerated in such a sketch as this: they were in fact only reformed Benedictines, and in a general classification may be included with the parent order, to which these rivals imparted new tone and vigour, as the Benedictine family.

The first of them was the CLUGNIAC order, so called because it was founded, in the year 927, at Clugny in Burgundy, by Odo the abbot. The Clugniacs formally abrogated the requirement of manual labour required by the Benedictine rule, and professed to devote themselves more sedulously to the cultivation of the mind. The order was first introduced into England in the year 1077 A.D., at Lewes, in Sussex; but it never became popular in England, and never had more than twenty houses here, and they small ones, and nearly all of them founded before the reign of Henry II. Until the fourteenth century they were all priories dependent on the parent house of Clugny, though the Prior of Lewes was the High Chamberlain, and often the Vicar-general, of the Abbot of Clugny, and exercised a supervision over the English houses of the order. The English houses were all governed by foreigners, and contained more foreign than English monks, and sent large portions of their surplus revenues to Clugny. Hence they were often seized, during war between England and France, as alien priories. But in the fourteenth century many of them were made denizen, and Bermondsey was made an abbey, and they were all discharged from subjection to the foreign abbey. The Clugniacs retained the Benedictine habit. At Cowfold Church, Sussex, still remains a monumental brass of Thomas Nelond, who was prior of Lewes at his death, in 1433 A.D., on which he is represented in the habit of his order.

In the year 1084 A.D., the CARTHUSIAN order was founded by St. Bruno, a monk of Cologne, at Chartreux, near Grenoble. This was the most severe of all the reformed Benedictine orders. To the strictest observance of the rule of Benedict, they added almost perpetual silence; flesh was forbidden even to the sick; their food was confined to one meal of pulse, bread, and water, daily. It is remarkable that this the strictest of all monastic rules has, even to the present day, been very slightly modified; and that the monks have never been accused of personally deviating from it. The order was numerous on the Continent, but only nine houses of the order were ever established in England. The principal of these was the Charterhouse (Chartreux), in London, which, at the dissolution, was rescued by Thomas Sutton to serve one at least of the purposes of its original foundation—the training of youth in sound religious learning. There were few nunneries of the order—none in England. The Carthusian habit consisted of a white cassock and hood, over that a white scapulary—a long piece of cloth which hangs down before and behind, and is joined at the sides by a band of the same colour,

about six inches wide; unlike the other orders, they shaved the head entirely.

The representation of a Carthusian monk, which we here give, is reduced from one of Hollar's well-known series of prints of monastic costumes.

CARTHUSIAN MONK.

About one hundred and seventy years after, viz., in 1098, arose the CISTERCIAN order. It took the name from Cîteaux (Latinised into Cistercium), the house in which the new order was founded by Robert de Thierry. Stephen Harding, an Englishman, the third abbot, brought the new order into some repute; but it is to the fame of St. Bernard, who joined it in 1113 A.D., that the speedy and widespread popularity of the new order is to be attributed. The order was introduced into England at Waverly, in Surrey, in 1128 A.D. The Cistercians professed to observe the rule of St. Benedict with rigid exactness, only that some of the hours which were devoted by the Benedictines to reading and study, the Cistercians devoted to manual labour. They affected a severe simplicity; their houses were to be simple, with no lofty towers, no carvings or

CISTERCIAN MONK.

representations of saints, except the crucifix; the furniture and ornaments of their establishments were to be in keeping—chasubles of fustian, candlesticks of iron, napkins of coarse cloth, the cross of wood, and only the chalice might be of precious metal. The amount of manual labour prevented the Cistercians from becoming a learned order, though they did produce a few men distinguished in literature; they were excellent farmers and horticulturists, and are said in early times to have almost monopolised the wool trade of the kingdom. They changed the colour of the Benedictine habit, wear-

* This is the computation of Tanner in his "Notitia Monastica;" but the editors of the last edition of Dugdale's "Monasticon," adding the smaller houses or cells, swell the number of Benedictine establishments in England to a total of two hundred and fifty-seven.

ing a white gown and hood over a white cassock; when they went beyond the walls of the monastery they also wore a black cloak. St. Bernard of Clairvaux is the great saint of the order. They had seventy-five monasteries and twenty-six nunneries in England, including some of the largest and finest in the kingdom.

The Cistercian monk, whom we give in the woodcut, is taken from Hollar's plate.

There were other reformed Benedictine orders arose in the eleventh century, viz., the order of CAMALDOLI, in 1027 A.D., and that of VALLOMBROSA, in 1073 A.D., but they did not extend to England. The order of the GRANDMONTINES had one or two alien priories here.

The preceding orders differ among themselves, but the rule of Benedict is the foundation of their discipline, and they are so far impressed with a common character, and actuated by a common spirit, that we may consider them all as Benedictines.

We come next to another great monastic family which is included under the generic name of Augustines. The Augustines claim the great St. Augustine, Bishop of Hippo, as their founder, and relate that he established monastic communities in Africa, and gave them a rule. That he did patronise monachism in Africa appears probable, but it is not clear that he founded any distinct order; nor was any order called after his name until the middle of the ninth century. About that time all the various denominations of clergy who had not entered the ranks of monachism, priests—canons, clerks, &c.—were incorporated by a decree of Pope Leo III. and the Emperor Lothaire into one great order, and were enjoined to observe the rule which was then known under the name of St. Augustine, but which is said to have been really compiled by Ivo de Chartres from the writings of St. Augustine. It was a much milder rule than the Benedictine. The Augustinians were divided into Canons Secular and Canons Regular.

THE CANONS SECULAR OF ST. AUGUSTINE were in fact the clergy of the cathedral and collegiate churches, who lived in a community on the monastic model; their habit was a long black cassock (the parochial clergy did not then universally wear black); over which, during divine service, they wore a sur-

A.D.), in Cobham Church, Kent, in which the almuce, with its fringe of bell-shaped ornaments over the surplice, is very distinctly shown; it is fastened at the throat with a jewel. The effigy of Sir John Stodeley, canon, in Over Winchendon Church, Bucks (died 1505), is in ordinary costume, an under garment reaching to the heels, over that a shorter black cassock, girded with a leather girdle, and over all a long cloak and hood.

THE CANONS REGULAR OF ST. AUGUSTINE were perhaps the least ascetic of the monastic orders. Enjol de Provins, a minstrel (and afterwards a monk) of the thirteenth century, says of them, "Among them one is well shod, well clothed, and well fed. They go out when they like, mix with the world, and talk at table." They were little known till the tenth or eleventh century, and the general opinion is, that they were first introduced into England, at Colchester, in the reign of Henry I. Their habit was like that of the secular canons—a long black cassock, cloak and hood, and leather girdle, and four-square cap; they are distinguished from the secular canons by not wearing their beard. According to Tanner, they had one hundred and seventy-four houses in England—one hundred and fifty-eight for monks, and sixteen for nuns; but the editors of the last edition of the "Monasticon" have recovered the names of additional small houses, which make up a total of two hundred and sixteen houses of the order.

The Augustine order branches out into a number of denominations; indeed, it is considered as the parent rule of all the monastic orders and religious communities which are not included under the Benedictine order; and retrospectively it is made to include all the distinguished recluses and clerics before the institution of St. Benedict, from the fourth to the sixth century.

The most important branch of the Regular Canons is the PREMONSTRATSIAN, founded by St. Norbert, a German nobleman, who died in 1134 A.D.; his first house being in a barren spot in the valley of Coucy, in Picardy, to which the name of Pré-montre was given, and from which the order took its name. The rule was that of Augustine, with a severe discipline superadded; the habit was a coarse black cassock, with a white woollen cloak and a white four-square cap. Their abbots were not to use any episcopal insignia. The Premonstratensian nuns were not to sing in choir or church, and to pray in silence. They had only thirty-six houses in England, of which Welbeck was the chief; but the order was very popular on the Continent, and at length numbered one thousand abbeys and five hundred nunneries.

THE TRINITARIANS, also, from the name of their founder, called Mathurins, and from their object, Brethren of the Redemption of Captives, were a confraternity of the Augustines, founded in 1180 by John de Matha and Felix de Valois—"the Clarkson and Wilberforce of their time," Mrs. Jamieson appropriately calls them—for the redemption of slaves and captives. In the first year of their labours these two men redeemed one hundred and eighty-six Christian captives from the hands of the Moors in Africa, the second year one hundred and ten, the third one hundred and twenty. They were introduced into England by Sir William Lucy of Charlecote, on his return from the Crusade, who built and endowed for them Thellesford Priory in Warwickshire, and subsequently they had eleven other houses in England. St. Rhadegunda was their tutelary saint. Their habit was white, with a Greek cross on the breast of red and blue—the three colours being taken to signify the three persons of the Holy Trinity, viz., the white, the Eternal Father; the blue, which was the transverse limb of the cross, the Son; and the red, the charity of the Holy Spirit.

Under this rule are also included the GILBERTINES, who were founded by a Lincolnshire priest, Gilbert of Sempringham, in the year 1139 A.D. There were twenty-six houses of the order, most of them in Lincolnshire and Yorkshire; they were all priories dependent upon the house of Sempringham, whose head, as prior-general of the order, appointed the priors of the other houses, and ruled absolutely the whole order. All the houses of this order were double houses, that is, monks and nuns lived in the same enclosure, though with a rigid separation between their two divisions. The monks followed the Augustinian rule; the nuns followed

the rule of the Cistercian nuns. The habit was a black cassock, a white cloak and hood, lined with lambskin. The "Monasticon" gives very effective representations (after Hollar) of the Gilbertine monk and nun.

The order of our Saviour, or, as they are usually called, the BRIGITTINES, were founded by St. Bridget of Sweden, in 1363. They were introduced into England by Henry V., who built for them the once glorious nunnery of Sion House. At the dissolution, the nuns fled to Lisbon, where their successors still exist. Some of the relics and vestments which they carried from Sion House have been carefully preserved ever since, and are now in the possession of the Earl of Shrewsbury.* Their habit was like that of the Benedictine nuns—a black tunic, white wimple and veil, but is distinguished by a black band on the veil across the forehead.

THE NUNS OF FONTEVRAUD was another female order of Augustinians, of which little is known. It was founded at Fontevraud in France, and three houses of the order were established in England in the time of Henry II.; they had monks and nuns within the same enclosure, and all subject to the rule of an abbess.

THE BONHOMMES were another small order of the Augustinian rule, of little repute in England; they had only two houses here, which, however, were reckoned among the greater abbeys, viz., Esserug in Bucks, and Edindon in Wilts.

Other small offshoots of the great Augustinian tree were those who observed the rule of St. Austin according to the regulations of St. Nicholas of Arroasia, who had four houses here; and those who observed the order of St. Victor, who had three houses.

There were besides a great number of HOSPITALS; the last edition of the "Monasticon" enumerates no less than three hundred and seventy of them; founded originally by the sides of the high roads for the relief of travellers, and especially of pilgrims, they were at length devoted to the relief of poor and impotent persons, answering to our modern almshouses. These had usually two or three Augustine canons, the prior acting as master of the house, the brethren acting as chaplains and confessors; and it is probable that the alms-people observed some of the usages of a religious rule. The canons of some of these hospitals had local statutes in addition to the general rule, and were distinguished by some peculiarity of habit; thus the canons of the hospital of St. John Baptist, at Coventry, wore a cross on the breast of their black cassock, and a similar one on the shoulder of their cloak.

ART IN THE PROVINCES.

LEEDS.—Mr. J. White, who has recently been appointed Master of the Leeds School of Practical Art, delivered at the commencement of last month his inaugural lecture on the "Importance of Art-Education," in which he argued that drawing should form a part of general education, whatever the condition of life: "Reading," he said, "was taught as a means of acquiring knowledge; writing as a means of retaining and extending that knowledge; and drawing should be taught, in conjunction with the latter, and to the same intent."

WOLVERHAMPTON.—The annual meeting of those interested in the School of Practical Art at this town was held on the first Monday in August. The report read by the Secretary is by no means discouraging, though not so satisfactory as could be desired, owing to the debt still encumbering the finances of the institution. Efforts have been made to relieve the School from this pressure, and nearly £700 have been collected for this purpose; but there yet remains a sum of £450 owing. The evening classes showed a deficiency of sixteen pupils in comparison with the number who attended the preceding year; this falling off was attributed in some degree to the establishment of a class at the Free Grammar School, under the superintendence of Mr. Chittenden, the Master of the School of Art. On the other hand, the day classes had increased in numbers, and the aggregate fees had also advanced to something beyond the amount received in 1855. Eighteen pupil teachers, connected with the parochial schools of the town and its vicinity, were training in the school, having been admitted upon payment of half the usual fees.

* Mrs. Jamieson, p. 137.

CANON OF ST. AUGUSTINE.

plice and a fur tippet, called an *almuce*, and a four-square black cap, called a *baret*; and at other times a black cloak and hood with a leather girdle; according to their rule they might wear their beards, but from the thirteenth century downwards, we find them usually shaven. The canon whom we give in the woodcut, from one of Hollar's plates, is in ordinary costume.

There are numerous existing monumental brasses in which the effigies of canons are represented in choir costume, viz., surplice and amice, and often with a cope over all; they are all bareheaded and shaven. We may mention especially that of William Tannere, first master of Cobham College (died 1418

THE ROYAL PICTURES.

ST. CATHERINE.

Guido, Painter. J. M. St. Eve, Engraver.
Size of the Picture, 10½ in. by 7½ in.

GUIDO RENI, generally known by his christian name only, was born at Calvenzano, near Bologna, in 1574-5. His works rank not only among the best of the Bolognese school, but also with the highest of the Italian painters. He was the son of a musician, and in his early years studied music with the purpose of making it his profession. He soon, however, altered his intention, and turned his thoughts to painting; placing himself first under Denis Calvart, a Flemish artist of high repute settled in Italy, and subsequently, in 1595, in the school of the Caracci, which had not then been very long established in Bologna. Of the three Caracci, Ludovico's style was that which most pleased Guido, and which he followed. In 1602 he went to Rome, and carefully studied all the great masters there, especially Raffaele; but the works of Caravaggio seemed above all others to excite his admiration, and for a time he followed the style of this painter—so forcible and true, yet coarse, and with strong contrasts of light and shade. He did, it is true, long continue to take Caravaggio as his model, but formed a style of his own, in accordance with the prevailing taste of the more refined painters of the Roman school, and of his former masters, the Caracci. It is said that Caravaggio, who, prior to the appearance of Guido in Rome, stood highest among all the artists in popular favour, was so enraged at the success achieved by the new comer that he loaded him with calumnies. Annibal Caracci, who was also in Rome at this time, and Guido's friend and fellow-student Albino, showed him so much hostility that he at length quitted Rome in disgust: not, however, till he had executed works which have immortalised his name; among these his grand fresco of the "Hours preceded by Aurora," in the Palazzo Raspignosi, stands most prominent. This work has been beautifully engraved by Morghen, and has thus been made known to thousands who have never seen the original. It is painted in what is considered Guido's second manner, exhibiting in a remarkable degree the effective treatment of light and shade he had learned from Caravaggio.

Guido returned to Bologna, and painted his famous picture of the "Murder of the Innocents" for the Church of St. Dominico, and the "Repentance of Peter" for the Palazzo Zampieri. But the Pope Paul V., who much regretted his departure from Rome, prevailed upon him to return thither to decorate his chapel in Santa Maria Maggiore. This work being completed, he once more went back to Bologna, and was no sooner settled there again than commissions flowed in upon him from all parts of Italy—so numerous were they that he was absolutely compelled to refuse many.

It is a fact too apparent to be contradicted that the lives and actions of men are rarely in harmony with their creeds and doctrines; many is the writer whose history negatives all the truths he has taught others; poets are known to have had but little real sympathy with scenes they have described in most glowing language, and painters to have felt no heart-reverence for what they have represented with such profoundly religious sentiment and expression. It is a curious problem this in the constitution of man, but it is nevertheless one most humiliating to our nature and character. Here was Guido, for example, whose head and hand were ever engaged on the most serious, and often the most sublime, themes—themes in which, one might reasonably suppose, his heart would have some share—exhausting his gains by extravagance and gambling, and his life by dissipation, so that his latter years were embittered by poverty and privation: notwithstanding, he received large sums for his pictures—as such as one hundred guineas for a full-length figure, an enormous price at that period. He died in 1642.

His "St. Catherine," in the collection at Windsor Castle, though a small picture, is a very beautiful example of his sweet and graceful pencil; the face is noble in expression, and the draperies exhibit the bold and massive forms peculiar to most of the Italian painters of Guido's time.

CORRESPONDENCE

FROM THE

UNITED STATES.

DEAR SIR,—The happy subsection of "Yankeeedom" from whose attractions in Nature and Art I pick suggestions for my present letter is—in area—the very smallest daughter in our great family of nations—so small, comparatively, that she is pettingly and patronizingly called "Little Rhody" by her bigger sisters—prone to brag (with a native orator) of the possession of "larger lakes, broader valleys, higher hills, longer rivers, and faster folks than England, or anywhere else *dar* have!" Her entire domain is but thirty-seven by forty-seven miles in extent; her population hardly reaches one hundred and fifty thousand; and she sends (senators excepted) but two representatives to Washington to the thirty-three of New York. Diminutive, though, as she thus is in body, I shall show you that she has a very large soul, and is, though least, by no means last here, in the grand march of human progress. Her enterprise gave birth (it may be almost said) to our now stalwart commerce, and in her workshops was sung the lullaby of our mighty manufacture. Stately ships from all seas sought her ports long before our present chief maritime towns grew into their fame; and she can now show you within her territory the first cotton-mill ever built in America, and (in a ratio with her area and population) a greater variety, extent, and success in Art-industry, than any other state of the Union. Physically, nature has decked her with becoming grace, and, in moral and mental growth, as well as in social refinement, she is eminently distinguished. She has sent out into the world her quota of Art-workers, and she possesses a fair share of Art-treasures. Lastly, she is a liberal and appreciative patron of the *Art-Journal*; for your agent in this city tells me that his monthly sales exceed two hundred copies! here, you see, is a varied and interesting text wherewith to preach.

It was in other days, long gone by, that the Indian and the Whalers, at which I have hinted, whitened their waters with their venturesome sails. It was not ordered that commerce should be the "mission" of "Little Rhody;" so she has slipped her great cables, and now holds only to a respectable foreign intercourse and a very lively coasting trade. Enough, though, of Indian and of ocean-wealth comes in to help the development of the liberal spirit in which she was born and nurtured, and to lay the foundation of the prosperity and happiness everywhere so evident in the homes and in the hearts of the people.

As the commercial life of Rhode Island subsided, the manufacturing activity began, and grew, until now, as I have intimated, its achievement is not surpassed in any part of the Western world. This industry is developed in every variety of product, but more especially in the making and in the printing of cotton goods; in machinery and all kinds of iron-work; and in jewellery and silver ware of form and value *ad libitum*. The total value of the annual product of the cotton-mills in Providence is set down at nearly a million of dollars, and that of the print-works (which are among the chief establishments of the kind in America) as little less than three millions. The rollers used in the printing are all engraved at home, and, as far as possible, the designs employed are made in the factories, or procured from native artists.

The jewellery of various kinds made in Providence amounts yearly to more than two and a half millions of dollars, and the iron products contribute as much more to the annual industrial estimates of the city. In the first of these manufactures no less than fifty-six establishments are actively employed, and in the second twenty-two—producing immense supplies of gold and silver wares, both of ornament and of use; all kinds of steam machinery, and every variety of tools and of other iron implements and articles.

The manufacture of screws is a matter of special interest here, both from the fact of the very admirable and efficient manner in which the work is done, and from the remarkable circumstances that, of the entire product of these little implements in the United States, the greater part (eighty-seven one-hundredths is the exact figure) are made in the

Providence establishments. The labour occupies one thousand hands, with the result of an annual value of over a million dollars. More than six hundred different sizes and kinds of screws are made in the two factories here, which turn off each day fourteen thousand gross, with a daily residuum of three tons and a half of iron turnings or chips. Screws were first made here by machinery, in 1834, in a very humble way, but since that time the business has constantly increased, and the manufacture has been wonderfully facilitated and perfected by the continual simplification and improvement of the machinery employed. The precision and rapidity, and the almost life-like mode of work of the three machines used to complete the screw is most curious and interesting: first the cutting of the wire of the required length, with the formation of the head—ninety per minute; next (which is the labour of the second machine) the trimming of the head and the cutting of the groove; and afterwards, with the third apparatus, the making of the thread; the last two of these wonderful little machines seemed to me to possess a most precise knowledge of their duty, and to take the greatest delight in the performance of it.

Another special manufactured product of Providence—with the mention of which I must pass on from the industrial to the Fine Art labour of our little state—is that of butt-hinges. This labour was begun here (and for the first time, to any extent, in the United States) in the year 1842. It was also almost the first manufacture of loose-joint butts in the world—and, in this want, Providence has ever since continued to supply nearly "all creation."

Have I not, even thus hastily, demonstrated my fact—of the contributions of Rhode Island to American Art-labour in its more material shapes? and is there not something yet left to be said for her in a more æsthetic manifestation? *Attendez*: Gilbert Stuart, one of the two or three "old masters" in American Art, and one of the first of our painters in respect both to time and talent—he who has left to his country and to the world, the accepted memory of the form and face of Washington—was a son of Rhode Island, born in days long passed, on the shores of the Narraganset,—near where the waters of that beautiful bay (the great heart of the state) come out from the sea,—in an old snuff-mill, yet standing, and carefully chronicled in my sketch-book, with other venerable and honoured shrines of poetic and historic association here. It is not necessary that I should discourse at this time upon the scope and characteristics of Stuart's genius, of his vigorous and truthful portraiture, his clear, bold, honest execution, and his magic colour, vivid upon his canvas to-day as once upon his palette;—this is all familiar to the Art-lover the world over, and will be re-told in every history of the Pencil. The pictures of Stuart may be found among the heirlooms of many families in Rhode Island. The state possesses two repetitions, from his own hand, of his famous full-length of Washington—one is preserved in the Capitol at Newport, and the second in the other state house at Washington.

Another honoured son of Rhode Island was Malbone, one of the happiest painters in miniature which this or any country has produced. "Whoever," it has been rightly said, "writes the history of American genius, or of American Art, will have failed to do justice to the subject if he omit the name of Malbone." Many of his best works (they were not numerous, for he died very early) are to be found in this vicinity: a famous group of three three-quarter length female figures, called "The Hours," is carefully treasured in the Athenæum of this city. It was presented by the artist to his sister, and after her death was purchased for twelve hundred dollars, and given to the present owners—the money being subscribed through the solicitations of a few patriotic and Art-loving ladies. The picture was painted during the artist's visit to London in 1801, and was praised by West as a work which "no man in England could excel."

Washington Allston, who was an intimate friend and fellow-student of Malbone, said of him that, "He had the happy talent, among his many excellences, of elevating the character without impairing the likeness; this was remarkable in his male heads; and no woman ever lost any beauty from his hands—nay, the fair would often become still fairer under his pencil; and to this he added a grace of execution

GUIDO, PINXT

ST. CATHERINE

FROM THE MUSEUM OF THE LATE ...

...

all his own." There is, or was, a work of Malbone's in Boston, which Stuart used to visit once a year, charging the owner to take great care of it, "as it was decidedly the finest miniature in the world."

The picture of "The Hours," by which Malbone will be best known hereafter, is in size six by seven inches, upon a single sheet of ivory. It contains, as I have said, three young female figures, representing the past, the present, and the coming hours, or, according to the Greek personification, and to the artist's inscription upon the back of the work—"Eunomia, Dice, and Irene." In composition the work is remarkably simple; and in the subtle changes of expression and character, the sentiment of the story is daintily and clearly revealed, while in colours it is marvellously pure and brilliant. The only grave mistake in the work, to my feeling, is the careful representation of the costumes and headdress in vogue when it was painted, but obsolete and disagreeable now. Malbone was a native of Newport, and he died in Savannah, in Georgia, in 1807, at the age of thirty-two.

Among her living artists, Rhode Island has a worthy successor, in many points, to her departed Malbone, in Mr. Richard M. Staigg. There is a force and fulness and flexibility of manner in Mr. Staigg's miniatures, a strength and massiveness of portraiture and character, and a rich fleshiness of colour not often seen in even good works in his department. He is well employed in his studio at New York in the winter, and through the summer months at his native home of Newport. This ancient capital of Rhode Island is at this time one of the most fashionable of American watering-places: but happily the good old truthful spirit of the town seems to leaven the hollow lump of the exotic influence, instead of being itself dissipated and destroyed. This fortunate result is helped not a little by the circumstance that the intrinsic attractions of the region—in its healthful climate, its beautiful nature, and its genuine social life—lead the best of its visitors to make it their permanent summer abode, in their own villa homes, instead of in the demoralising vagabondism of hotels. Thus, in Newport, the explosive, high-pressure temperature of an ever-moving throng is powerfully controlled by the healthful conservative faith and grace of domesticity.

But I am wandering somewhat from my immediate theme. Let me sail, by island and headland, twenty-five miles up the bay back to Providence. The stranger in this charming city will not fail to remark a novel speciality everywhere in the architecture, public and private. Here the stately, and there the picturesque edifice—the church tower and the cottage porch; and all of such humble material as the despised brick. Looking thus upon the "deformed transformed," he will feel at once that the wand of some unique magician has been waved over all. The city owes this great and peculiar beauty to its wise and honourable appreciation of the genius of one of its own young architects, Mr. T. A. Telft, who has most successfully made the use of brick in picturesque construction a matter of especial study. Of his works, here and elsewhere, I shall have occasion to speak more particularly when I write, as I shall soon, about our Architectural Art. Mr. Telft is a Rhode Islander, born, I believe, somewhere in the neighbourhood of the painter Stuart's ancestral snuff-mill.

Rhode Island possesses an Art-association, located here, in Providence. It is a new society, and thus far has presented only two annual exhibitions. It has eligible apartments, very moderately furnished with busts and casts for the use of students. In the preface to the last year's catalogue the managers say, "That we must one day have a School of Design here, supported by our own manufacturers, and in turn supporting them, appears inevitable. The only question is one of time." The preface is right; and I am sure the decisive "question" will be satisfactorily answered before long. Let the people see to it. Of this "Rhode Island Art Association" I shall have more to say at another season. Among the Art-possessioners of Providence is a Madonna and Child (an oil picture) by Overbeck; works by Stuart, Copley, and Malbone; some of the productions of Made-moiselle Rosa Bonheur; pictures by Leutze, Mornel, Durand, Doughty, Woodville, Kensett, Stearns, Heely, Hinckley, Osgood, Sully, Morse, Terry, Hop-pin, Gignoux, Coleman, and Weber, and other American artists, with a reasonable sprinkling of "old

masters," good, bad, and indifferent. *A propos*, let me here ask your congratulations upon the promising circumstance of the rapid disappearance from our private galleries of the "old masters," who have ruled there so long and so despotically, to the detriment of the better productions of our own easels.

I regret that I must close my letter with the sad record of the death of that Nestor of American landscape-art, Thomas Doughty. He died in New York, after a long illness, on the 24th of July last, at the age of sixty-three years. He was one of the earliest of our painters who distinguished himself in that department of study to which he was devoted; and at one time he deservedly held a very high position—but he outlived both his genius and his fame. He has left behind him, scattered all over the country, a great number of works of very unequal merit. Those executed in the acme of his power will be always treasured as rare examples of true Art. His favourite and happiest themes were brooky nooks and pastoral passages, with alternating copse and lawns, and far-off peeps of gentle hills and water: all seen in such moistened, vapoury atmosphere, and such greyish-clouded skies, as the climate of England so often produces. His works owe their charm—though generally very carefully and nicely wrought—less to their individuality of character in the objects represented, than to the general sentiment which they always either exhibit or suggest. He worked more from feeling than from knowledge; and thus it was, perhaps, that when in years and cares, in privations and pain, his heart failed him, so failed his hand also. He went to the easel from the humble position of a leather-dresser, quite uneducated in Art or otherwise, at the late age of twenty-eight, and hunched with a wife and child dependent upon his labour. "Contrary to the wishes of all my friends," he once said, "I resolved to pursue painting as a profession, which, in their opinion, was a rash and uncertain step. My mind, however, was firmly fixed; I had acquired a taste for Art which no circumstance could unsettle." In respect to material reward, those predictions of his friends were unhappily better realised than were his own stout hopes; for despite his best successes, his life was one of great pecuniary struggles,—though this painful sequel must in justice be charged to his own faults of character, as much as to the faithlessness of his Art.

Very sincerely yours,

T. A. R.

Providence, Rhode Island, Aug. 5.

THE HARBOURS OF ENGLAND.*

WE are glad to meet with this series of Turner's works in the form in which it is presented to the public. It is to the taste and enterprise of the publisher that we are indebted for a set of these engravings, and in a form most convenient and accessible to those by whom they will chiefly be esteemed—we mean students of Art; not that all are models for imitation, but that the principles they involve are indispensable to good Art. We are glad, we say, to meet with them in this form; for whatever may be said of Turner's colour, we find him generally right in a reduction to black and white. Those who do not know that Turner never completed a series that he commenced, will be disappointed to find that the number of these plates extends to only twelve; and will be mortified to find that Liverpool, Shields, Newcastle, Sunderland, and other similar places are omitted, while such places as Margate, Ramsgate, and Deal, are included in the series—which, in addition to these, contains also Dover, Plymouth, Catwater, Sheerness, Portsmouth, Falmouth, Sidmouth, Whithy, and Scarborough. In his preface the editor essays to account for Turner's habitual interruption of projected serials; but he assigns no intelligible reason. If any cause for such not unfrequent, abrupt, and unsatisfactory conclusions, is to be given, it will be found in the *ἰδιωτικότητα* of the artist as mirrored in his works, of which we need see but one, to learn that it is the production of a man

who shelters himself from a declaration of subordinate form, natural and factitious, in the sublime informalities of the phenomena of nature. Turner could be formal in nothing; it was enough for him that Margate was an English harbour; that position did not assert that Liverpool and Bristol were not; and although, in his "Rivers of France," the Rhone and the Garonne were omitted, there was no inference that these rivers were not rivers of France. Mr. Ruskin has spoken of some of Turner's last works in such a strain as to induce a belief that he ranked them among the best productions of the artist's best time. He now says that "The Temeraire" was his last really worthy picture. We agree with him in this; it is, as a whole, unsurpassed by any similar work of any time—though still disfigured by that imperfection in form and infirmity of execution which derogate so materially from many of Turner's best works. Look at the thing that tows the venerable hulk; but for the chimney you could not resolve it into a steam-tug. We remember when the picture was in the hands of the engraver, the latter was in the utmost embarrassment with regard to this passage of the picture, and ventured to make the thing like a steam-boat—a liberty which excited in the artist a paroxysm of wrath. What had he to do with form? what had he to do with the forms of steam-boats?—he who was for ever shrieking like a sea-mew to the music of the "felon winds"—who now overwhelms us with the dark oppression of his storm-cloud, and now administers his sunbeams until, like the bad angel, we are

"Drunk with excess of light."

The steam-boat, however, remains in the plate as the engraver shaped it. Mr. Ruskin's letter-press to these plates does not panegyrise Turner with anything like the devotional homage which characterises his "Modern Painters;" his criticism is more reasonable; he aims at intelligibility, and does not always fail. In his introduction he says, "Of one thing I am certain—Turner never drew anything that could be seen without having seen it;—that is to say, though he could draw Jerusalem from some one else's sketch, it would be, nevertheless, entirely from his own experience of ruined walls; and though he would draw ancient shipping (for an imitation of Vandevelde, or a vignette to the voyage of Columbus) from such data as he could get about things which he could no more see with his own eyes, yet when of his own free will, in the subject of Ilfracombe, he, in the year 1818, introduces a shipwreck, I am perfectly certain that, before the year 1818, he had seen a shipwreck, and, moreover, one of that horrible kind—a ship dashed to pieces in deep water at the foot of an inaccessible cliff. Having once seen this, I perceive also that the image of it could not be effaced from his mind. It taught him two great facts, which he never afterwards forgot—namely, that both ships and sea were things that broke to pieces. *He never afterwards painted a ship quite in fair order.*" This is a specimen of that kind of composition by which Mr. Ruskin mystifies his non-artistic readers into profound respect for his penetration, at some expense to the reputation of Turner. What is here meant is that Turner in imaginary composition drew upon nature and Art until these sources were exhausted, and then drew on his own invention for the remainder—the simple resources of every other artist. Had we been told that Turner declined altogether to treat the subject of Jerusalem, because he had never been there, it would raise the memory of Turner in the estimation of strangers, who may desire to learn something of this great painter. "I said," continues the editor, "that at this period he first was assured of another fact, that the sea also was a thing that broke to pieces. The sea up to that time had been generally regarded by painters as a liquidly composed, level-seeking, consistent thing, with a smooth surface, rising to a water-mark on the sides of ships; in which ships were scientifically to be imbedded and wetted up to said water-mark, and to remain dry above the same. But Turner found, during his southern coast tour, that the sea was *not* this; that it was, on the contrary, a very incalculable and unhorizontal thing, setting its 'water-mark' sometimes on the highest heavens as well as on the sides of ships; very breakable into pieces; half of a wave separable from the other half, and on the instant carriageable miles inland," &c. This is mere senseless verbiage—a

* "The Harbours of England," engraved by Thomas Lupton from the original drawings made expressly for the work by J. M. W. Turner, R.A., with illustrative text by J. Ruskin. Published by E. Gambart & Co., London.

tissue of absurdity, which could only be said of some creature whose senses were in their earliest dawn. Mr. Ruskin alludes here to circumstances which gave rise to Turner's picture of "The Shipwreck," a large composition, in the possession of one of the directors of the British Institution. It is well known by the engraving; but we believe this picture was painted before 1818; and in this picture Turner has not shown his scrupulous observation of probabilities, for he has placed a boat in a sea in which no such small craft could live a minute. But we must proceed to the plates. In the view of Dover the spectator is placed near the end of the jetties, at the entrance to the harbour, whence the Castle Cliff is seen to cross the composition, having the town at its foot, with the citadel cliff on the left. The castle and cliff are lighted by sunshine, but dominated by a dark and threatening sky, to which in tone the water responds. We know very well the appearance of Dover from this point—it is by no means like what Turner has represented; the town is altogether shrunk into nothing, while the castle hill is much exaggerated. As an effect it is most successful; but thus it was that Turner made pictures. Ramsgate is the next; and what we observe of the town is seen from near the lighthouse; but this is not so successful as Dover. The view of Plymouth is taken from the shore, looking at the town, with the citadel on the left. Here the sea is calm; over the town hangs a black cloud, on which is relieved a rainbow. Although an effect of calm, this plate is full of movement, even to distraction. It is followed by Catwater, the entrance to Plymouth Sound, another breezy subject, with a rolling sea. We agree with Mr. Ruskin in pronouncing Sheerness not only one of the best works of the series, but one of the best of Turner's marine subjects. We are again at sea off the harbour, which appears in the distance on the left, where are also seen a cutter and a light collier brig, both going to sea; while on the right is seen moored a ship of the line. A stiff breeze is blowing; and from the short crisp seas we understand that we are in an estuary. On the right the sky is darkened, and a wedge-like scudding shadow is thrown across the near section of water, and expanding to the right distance. This plate is really full of grandeur, suffering in novise from the enfeebling sparkle of distributed light. The view of Margate is taken from that side called Buenos Ayres, but it lies principally in shadow; it is extremely indefinite as a view of the town, but spirited as a coast composition. The view of Portsmouth is more recognisable as the representation of a place than the last we have noticed. The sky is admirable; and it were much to be desired that the water were equally well composed, but there are evident, here and there, seratchings of the artist's knife in search of relief where no relief is wanted, the sea being already sufficiently broken up. Falmouth is an excellent plate, full of detail, and distinguished by drawing more careful than usual. The evening sky, and the gem-like setting of the town in the composition, are most masterly; the nearest passages are not so agreeable. We look at Sidmouth from the sea, which is drawn in shade, and with greater breadth than usual. The effect is windy—a very favourite aspect with Turner, as affording flitting lights and a wild sky. The view of Whitby is a charming drawing: we are placed as usual on the sea, with the cliffs and monastery on our left, and looking directly into the harbour, into which a brig is sailing. The sea has breadth and movement, and the sky is deep and full of atmosphere. We view Deal in like manner from the sea. This subject is almost entirely an expression of wind, and as such highly successful. Scarborough is really the most quiescent picture of the whole, and all the parts come together, so as to form a most agreeable composition. All these plates are in mezzotint; and it were much to be desired that a more extensive selection of Turner's works could be thus published; for, independently of their charm to all lovers of Art, they are, as we before remarked, of infinite value to the student. The prints are all well and carefully engraved by Mr. Lupton, and it is certain that they have received much benefit from the "tones" of Mr. Ruskin: altogether the work is a valuable acquisition to the artist and Art-lover, and its production is highly to the credit of the enterprising publisher.

MINOR TOPICS OF THE MONTH.

THE ROYAL ACADEMY "EVENING."—The close of the Exhibition was marked, as it has for some years been, by an assemblage of the exhibitors, and by calling together a number of the patrons and lovers of Art, whom the Academy "entertained." The rooms were, of course, lit with gas, and the pictures were seen to great advantage by the light thus produced—many of them, indeed, for the first time; the upper row having the full benefit of that which the day-time kept from them. The evening was in all respects gratifying; every exhibitor had a right of admission—the great majority in attendance were consequently artists; but mingled with them were many whose association with Art is only obtained by their love of it. A very liberal supply of refreshments was provided, and all the guests seemed content as well as delighted.

THE ART-TREASURES EXHIBITION AT MANCHESTER.—The foundations of the Art-palace at Manchester have been laid, and the works progress in a manner so entirely satisfactory as to leave no dread of ultimate success. The architect, Mr. Salomons, seems, next to the chairman, Mr. Fairbairn, to have gained "golden opinions;" while the contractors pledge themselves, in a manner not to be misunderstood, that the building shall be ready to receive its "treasures" early in the year 1857. The Committee are evidently labouring "with a heart and with a will;" and they are fully justified in anticipating an amount of public co-operation which cannot fail to realise their hopes. Their labours will now be devoted to the collecting from all quarters pictures and other works of Art. They are no doubt fully aware of the difficulties in their way; they are by no means insurmountable, and will be overcome by that energy and perseverance which have heretofore marked all the proceedings of the enterprising gentlemen who have taken this weighty matter in hand. We trust that ere long we may be able to report a number of noblemen and gentlemen who have placed their galleries at the disposal of the Committee.

THE MANCHESTER INSTITUTION.—The Committee announce their intention to open this Exhibition on the 9th of the present month of September, and they will do so under circumstances of great encouragement. The "Institution" is, as our readers know, a building eminently suited to the occasion; and we may indulge the hope that by its "inauguration," in so appropriate a manner, it will be the property of the trustees unencumbered by debt—the millstone round the neck of many valuable institutions, the power of which for good is thus often so embarrassed as to be rendered comparatively unavailing. The ceremonial of the 9th will be presided over by Lord Palmerston—a gratifying fact, and one that cannot fail greatly to promote the object in view; it will be, we believe, the first instance of a prime-minister ever having taken an active and prominent part in the formation of a society of this kind, and must be accepted as one of the most unequivocal signs of the times. His lordship is sure to be well supported; and the result will no doubt be among the most satisfactory of those events which have marked his long political career. Our purpose in again drawing attention to this subject is to express an earnest hope that the project will receive the aid of all by whom it can be rendered; that manufacturers especially, by contributing to the Exhibition, will assist to accomplish the many important advantages—to them and to all classes—which must arise out of this effort to improve and benefit the hundreds of thousands of artisans who people the greatest manufacturing city of the world.

THREE PICTURES of very remarkable character have been exhibited in London (on their way to Manchester); they are painted by Mr. W. Wyld, an English artist, but who, in consequence of his long residence in Paris, where his abilities have been recognised by a decoration of the Legion of Honour, has been generally classed among the painters of France. These works are large, and are designed to be the ornament of one of the best modern houses of Manchester, having been commissioned by Joseph Bull, Esq., an "ironmaster" of that great city, and one who, we rejoice to know, is foremost among the wealthy "patrons" to whom British Art must now-a-days look for its prosperity. They are pic-

tures of great merit, and are intended to illustrate in some degree the merchant's calling, and the repose he covets, as the recompence of labour. The one represents Venice in its palmy days; the other, Rotterdam in its zenith; and the third exhibits Tivoli. They are, however, rather recollections than portraits, for the artist has allowed himself a full licence in treating his subjects poetically, and has introduced into one a gorgeous ceremonial of the olden time—the Queen of Sheba embarking; while in the other merchants congregate, and there is all the incidental bustle of traffic and prosperity. Tivoli is a charming production, and "tells" with singular felicity, in its calm yet grand repose, between the two cities of commerce. The works are very honourable to the painter, and will add much to the Art-wealth of Manchester.

THE NATIONAL GALLERY.—Three or four new pictures were added to the National Collection on the eve of our going to press. Several more have been purchased, and, we expect, will be hung in time for us to notice the whole together in our next publication.

A STATUE OF THE LATE GENERAL SIR CHARLES NAPIER will shortly be placed at the south-west corner of Trafalgar Square, workmen being now employed in preparing the foundation for its erection. The statue—the cost of which will be defrayed by public subscription—is the work of Mr. G. C. Adams, and is cast in bronze by Messrs. Thompson, of Pimlico; we defer any remarks upon it till we can see it on the pedestal in its place. But why leave the pedestal which has been so long at the north-west corner still unoccupied? might not Sir Charles have stood there? and thus so far have produced a little harmony in this unfortunate square, that seems, somehow or other, always to have something "out of joint."

SOCIETY OF PAINTERS IN WATER-COLOURS.—At a general meeting of this society, held on the 30th of July, Mr. J. D. Harding was unanimously re-elected a member. Some time since he withdrew from this society, with the intention of devoting himself to painting in oil; but having now returned to the Society, we hope to see a continuation of those works whereby he has earned a reputation so widely extended. The unworthy treatment of Mr. Harding by the Royal Academy is a flagrant instance of the suicidal policy of that body, who, having themselves exhibited no landscape, properly so called, yet decline to elect one of the most eminent living masters in this department of Art.

LONDON AND MIDDLESEX ARCHEOLOGICAL SOCIETY.—The first annual general meeting of this Society was held on the 24th of July, at the Architectural Museum, Cannon Row, Westminster. After the business of the meeting, presided over by Lord Robert Grosvenor, M.P., was transacted, the members and visitors—a number of the latter being ladies—adjourned to Westminster Abbey, under the guidance of Mr. G. G. Scott, A.R.A., and the Rev. C. Bontell, where the former delivered a brief but interesting lecture on the Abbey; and the latter, as the company inspected the monuments, pointed out those most worthy of notice, and made appropriate comments upon them. We were among the visitors on this occasion; and strange as it may seem to many of our readers, though almost daily passing for the last ten years this noble edifice, and enjoying a near view of its time-worn roof and towers from the room in which we write, we have not, to the best of our recollection, been inside its walls for a far longer period than that just mentioned. What was our surprise and regret after so protracted an absence to find every available nook and corner crowded with the statues of distinguished individuals who have died during the last fifteen or twenty years, placed too, as it would seem, just wherever there was room for them to stand, without reference to suitability of position, and without the least regard to the ancient monuments, which, in many instances, they half conceal. Now, we assert at once that Westminster Abbey is not the proper depository of mere statues, however excellent they may be as works of Art; statues are not monuments reared in memory of the dead, they are testimonials to worth or genius, whether living or dead, and churches should be the receptacles of monuments only. But presuming statues to be what they are not, to crowd them into such a place as the Abbey, is an act that every one who

values taste in Art ought to protest against. Here is a museum of monumental sculptures, extending through a period of about five centuries, such as no other city in the world can show; but its value is rendered comparatively useless, not so much by the absence of due chronological arrangement of these works—which, however, we feel to be unavoidable—as from the intrusion of objects dissimilar in character, and which act as screens to hide the legitimate adornments of the sacred temple. We find the *living* portraits of Peel, and Campbell, and Mackintosh, and Watt, and scores of other worthies, standing, as they appear to us, in mockery of the dead who sleep below, or whose deeds are recorded on the surrounding walls. Public opinion has succeeded in closing the grave-yards of London against new occupants; let us hope it will be equally urgent in demanding that the Abbey of Westminster shall no longer be the receptacle of mere portrait-sculptures—the National Gallery is the only suitable receptacle for such works. When the new one is erected, a gallery should be especially appropriated to the statues of our great men, and thither those now in the Abbey, and St. Paul's too, should be removed. At present the right men are in the wrong places.

ARTISTS' GENERAL BENEVOLENT INSTITUTION.—The last Annual Report of this Institution, submitted to the subscribers on the 11th of August, has been placed before us. It alludes in gratifying terms to the continued and progressive advancement of the funds of the society,—the subscriptions at the annual dinner, in June, having reached the sum of £624 13s. 10d., including a donation of 100 guineas from Earl Stanhope, as the first fruits of the "Peel Memoirs." The council expresses its thanks to Lord Yarborough for his gift of the copyright and steel plates of Turner's "Wreck of the Minotaur," and "The Vintage of Macon," which will shortly be published for the benefit of the institution. The following are the receipts of the last financial year, ending June 30th, 1856:—

Life subscriptions and donations . . .	£691 16 10
Annual subscriptions	74 9 0
Dividends on funded stock	494 4 4
Ditto on the Jernegan bequest	12 2 6
Income tax returned to July 5	13 13 9
	£1196 6 5

Relief has been granted during the year to sixty-eight cases, at the half-yearly meetings, by sums amounting to £1060. The following gentlemen were appointed directors for the three ensuing years, in lieu of those who went out by rotation:—Messrs. T. S. Cope, E. W. Cooke, A.R.A., T. McLean, W. E. Frost, A.R.A., A. Elmore, A.R.A., E. P. Anson, T. Webster, R.A., and F. S. Cary. We shall rejoice if any recommendation of our own, or any influence we may have, should avail in promoting the enlarged utility of this excellent institution.

MR. PENNETHORNE, the Government architect and surveyor, has recently received a gratifying testimonial of the regard in which he is held by his professional brethren; upwards of seventy of whom, including a very large proportion of the most eminent, have signed a congratulatory letter to him on the completion of the new wing of Somerset House. They have also taken advantage of the opportunity to express their "cordial respect for his character as an architect and surveyor, and for his bearing as a gentleman." It is proposed to present Mr. Pennethorne with an impression, in gold, of the medal of Sir William Chambers (the first architect of Somerset House), which the Art-Union of London has in preparation for its subscribers.

ART IMITATIONS IN LEATHER.—**MR. WILLIAM SANDERS**, of 7, Mornington Road, has submitted to our inspection some works in cut leather, which are unquestionably of rare and singular merit, and fine examples of an art which he teaches as well as practises. They consist chiefly of birds and flowers, and are composed of bits of light leather, cut by hand, and so ingeniously put together as to be very accurate representations of wood carvings: it is difficult otherwise to describe their effect. They manifest industry as well as talent, and cannot fail to be admired wherever they are seen.

HER MAJESTY'S THEATRE.—The auspicious opening of this theatre was the prelude to a satisfactory close; and a very strong public feeling among all classes exists to support Mr. Lumley in his

arduous undertaking. He has carried his "season" through with even more than former triumphs; there was no evidence whatever of straightened resources; on the contrary, the general impression is that he did too much rather than too little. All parties are more than content, and the hope is universal that next year he will again obtain those "golden opinions" which have been this year his reward.

MR. AND MADAME GOLDSCHMIDT have returned to Dresden, having made a very extensive tour throughout England, and given enjoyment to thousands in all its principal cities and towns. We believe we are correct in saying that she will not again appear in public in this country; although she has taken no formal farewell, she has permitted it to be understood that her voice is not hereafter to minister to her fortune—in other words, she is wealthy enough, and, although in the zenith of life, with her rich gift of nature as capable as it ever was of delighting and astonishing, she prefers the calm quiet of domestic happiness to the labour and excitement of even a "concert stage." She has made "friends" everywhere, but nowhere are they more numerous than in England; in no country of the world is she more truly esteemed or more highly respected—not by any means alone for her genius, but for her private worth. Few public characters have mixed so little in what is called "society"—few have seen her who did not see her discharging the duties of her profession; but we have learned to regard her aid to estimate her none the less—and certainly no public person of our time has so thoroughly carried with her into private life admiration so closely bordering on affection. It will consequently gratify all who may read this notice to know that in private life no woman was ever more entirely happy; a foolish and wicked rumour to the contrary preceded her visit to England; the "thousand tongues" of slander had circulated a statement, as regarded Mr. Goldschmidt, in which there was not a syllable of truth—for which, indeed, there was not even a shadow of foundation. We have seldom known a gentleman more entirely admirable than Mr. Goldschmidt—as generous in disposition as she is, as entirely devoted as she is to that profession of which they are the ornaments—his taste for Art forms one of his best resources, and contributes, next to music, to the home-happiness of both. There is no liberal thought, no good deed which Madame Goldschmidt can devise or do, in which she will not be zealously seconded by her excellent, amiable, and accomplished husband; and we have good grounds for the belief that no woman has in wedded life a safer or better security for domestic happiness and prosperity.

THE NIGHTINGALE FUND.—This fund, the creation of which it will be recollected, we were the earliest to announce, has now reached the very large sum of about 37,000*l.*, and there is little doubt that it will amount to 40,000*l.* (clear of all expenses) before the committee are called upon to complete their contract with the public by transferring it to Miss Nightingale. That is all the committee have to do; their purpose was limited to its collection, to be handed over to Miss Nightingale, and expended by her for the benefit of that public by whom it has been contributed. It is, however, well known—indeed, it has been publicly announced—that Miss Nightingale, by the aid of a council (selected by her from the committee), will devise and mature, and subsequently promulgate, a plan for the formation of an institute for the education of nurses, to be attached to some existing hospital in London. There can be no doubt of the enormous amount of good that will hence result. Providence has endowed this admirable lady with faculties which peculiarly fit her for this important task; the public have supplied means by which she may work freely and untrammelled; and we entirely believe that the benefits she is destined to confer hereafter on her country and humanity will be infinitely greater and more extensive than those which followed her steps at Sentari and in the Crimea. We can, and perhaps may, fully detail the objects in view, and, under God's blessing, the certain results; but at present to do so would be premature. Miss Nightingale has returned to England; she is "at home;" but some time will no doubt elapse before she gathers health and strength to resume labours which have been rightly described as "superhuman."

REVIEWS.

THE SOLDIER'S DEPARTURE.—**THE SOLDIER'S RETURN.** Executed in chromo-lithography by VINCENT BROOKS, from the Pictures by J. RITCHIE. Published by T. BOYS, London.

Arma virosque pingo, has been the motto recently adopted by a large number of artists both here and in France. Of late years, the stirring martial incidents of flood and field were but sparingly set before us; and inasmuch as few of the living know anything of such deeds, except as they are inscribed on the pages of history, to the biographer and the historian, rather than to the painter, must be awarded the merit of kindling whatever warlike enthusiasm has been generated in those whose profession is not that of arms. The last year and the present have, however, overwhelmed us with war-pictures: we have seen the "Guards" marching out, and—marching home again; thousands of troops encamped and reviewed at Chobham and Aldershot; ships of prodigious size and armament floating quietly, or gallantly performing mimic fights on the waters that wash our southern coast. We know every port, town, and battery in the Baltic and Black Seas; we are positively better acquainted with Sebastopol, as it was two years since and as it now is, than we are with the Tower of London in its present condition: we have been in the trenches and the ravines of the Crimea, on the heights and in the camps, with all the brave fellows whose fortune it was to suffer heroically or to die gloriously on that well-fought field. All these things the pencil of the artist, and the camera of the photographer, have placed before the people of England

"Who live at home at ease."

And now that the last hostile shot—for very many years, we trust—has been fired, let us hope the artist will turn his thoughts to subjects of a more pleasing nature, and more in harmony with those arts over which Peace loves to spread her gentle influences and her protecting wings. One of the two prints that have called forth these remarks indicates such a return. The first, "The Soldier's Departure," represents a detachment of Highlanders marching, at sunset, through a defile of Scottish mountain-land; one of the men, having lingered behind the rest to take his final leave of his family, assembled at the cottage-door, is now seen hurrying forward to overtake his companions: in the other plate he is meeting them again, all sound and well. Mr. Ritchie is an artist of considerable notoriety in Edinburgh; these subjects show him to possess the poetic feeling of a true painter; his style is peculiar, but very effective, and he is a rich colourist. All we need say of Mr. Brooks' success as a chromo-lithographer is, that when we saw these prints in a shop-window, before they came into our hands, we mistook them for highly-finished water-colour drawings. Few works of their class deserve to be more popular.

THE CHALK WAGGONER IN THE LIMOUSIN. Engraved by E. GOODALL, from the picture by ROSA BONHEUR. Published by E. GAMBART & Co., London.

This, we believe, is the first line-engraving executed from the works of Mademoiselle Rosa Bonheur, and it is also the first publication issued in England from one of her pictures; all prints that have hitherto appeared are lithographies produced in Paris. The "Chalk Waggon" was one of two pictures, the other being a "Drove of Cattle in Brittany," sent by the artist to the first exhibition of French works in Pall-Mall, in 1854, and was there purchased by William Wilson, Esq., of Banknock, the liberal and well-known collector, who has courteously allowed it to be engraved. It is well for the reputation of Mademoiselle Bonheur that her picture was placed in the hands of so skilful an engraver as Mr. Goodall, for there are but few of those who handle the *burin* who would not have failed in imitating the peculiarities of her style; Mr. Goodall has copied them perfectly. We have here not alone her bold conceptions, and her accurate knowledge of the anatomy of the figure, both of man and horse, but we recognise also the singularity of texture which distinguishes her works from those of any other artist—a peculiar softness or indistinctness of detail, that does not, however, become "woolly," as it is technically called—for if it did, we should consider it a defect rather than otherwise. To our eyes, this lady's style of painting imparts richness and delicacy to her works; most certainly it does to the engraving, which manifests these qualities in a high degree. The print is small, but it will be pronounced a gem of its class.

FERNY COMBES, A RAMBLE AFTER FERNS IN THE GLENS AND VALLEYS OF DEVONSHIRE. By CHARLOTTE CHANTER. Published by LOVEL REEVE, London.

This charming little volume is dedicated by its author "to the Rev. Charles Kingsley, and to Mrs. Kingsley, as a small token of the gratitude due to them for awakening and fostering in their children a love of nature and beauty; by their daughter, Charlotte Chanter." We thus learn that Mrs. Chanter is the sister of the "Charles Kingsley," whose "Glancus" was the companion of our rambles amid the sea-side beauties of Devonshire, last season; and truly these "children" have much cause for additional gratitude towards parents who fostered in them a "love of nature and beauty"—a love that has yielded such an abundant harvest. We expressed our gratitude last year to Mr. Charles Kingsley for having not only opened a new volume of nature for our perusal, but for having so paged and noted it, that pleasure and information were blended with the happiest skill; and now his sister, Mrs. Chanter, presents to us a brilliant little chronicle of ferns—the very gipseys of the nuderwood—the most graceful of all the leafy tribe that adorn our paths, and enwreath our hedge-rows and forest glades with their evergreen beauty.

Mrs. Chanter disclaims all pretension to supersede the scientific or necessary works already published on the study of ferns; her object being simply to give a short account of those that may be found in Devon, in such a manner as may render them readily recognised by the novice in botany, and to describe some few of the beauties of the beautiful districts of the West. "My humble effort," she says, "is designed to lead the youthful, and to cheer the weary spirit, by leading them with a woman's hand to the Ferny Combes and dells of Devon, where my best reward will be their innocent amusement, or their restoration to health under the soothing influences of a rambling tour." Mrs. Chanter advises the home-tourist "to leave the train at Bridgewater, and take the road which runs through Minehead to Lynton. Now that we have passed," she says, "Coleridge's 'Nether Stowey,' and Southey's 'Kilnc by the green sea,' which shines in the sun away to our right, with the hills of Wales beyond; after crossing the beautiful Quantock Hills, we see in front of us the country to which we are bound." The lady assures us this is the best entrance into Devonshire; though we confess we think it wiser to suffer the scenery to increase in beauty upon us than to dash into it at once; however, that is a matter of opinion. Mrs. Chanter's book is a sweet companion, whatever road is taken. "Combe" is the Devon name of "valley," and the valleys of Devon are rich in other growths besides ferns; the botanist will find a rich abundance of nearly all he seeks, and we need not remind our artist friends of the landscape treasures of the shire. The illustrations are exactly what we should expect, arranged, as they have doubtless been, by the taste and knowledge of Mr. Reeve, to whom the lovers of natural history are already so largely indebted for many of the most useful and delightful books in our language.

CHROMOLITHOGRAPHIES. Printed by M. & N. HANHART, London.

The establishment of Messrs. Hanhart has put forth another batch of coloured prints, all of them so good that it would be difficult to have a preference for one over the others. We have on many former occasions spoken so favourably of this comparatively new form of Art-productions, that our vocabulary of eulogistic terms is well-nigh exhausted; indeed, nothing seems now left for us to do but to record the appearance of these prints as they come into our hands. Of the number just received, the largest is from a picture by J. D. Harding—"Cluses," a picturesque mountainous scene in the kingdom of Sardinia; it is a bright sunshiny print, but the trees want the vigour and sharpness of touch which characterise this artist's works; the sky, mountains, and broken foreground are capital: the print is published by Rowney & Co. "Broadstairs," after J. Callow, "Andermach," and "Pe-trarch's House," after S. Prout—three prints published by Lloyd Brothers—are all good: in the first, the sea is dashed in with remarkable vigour and truth, and the "pair of Prouts" are as fresh and as faithful as if they had just come out of the lamented artist's quiet studio at Camberwell. An "Interior of a Cathedral," is the facsimile of a sketch by D. Roberts, R.A. "Ben Nevis," after T. M. Richardson, is noticeable for the transparency of its colouring, and the solidity with which the mountains are expressed; it is a charming subject, most felicitously treated. "The Meadow-side,"

sheep and cows, from a drawing by T. S. Cooper, A.R.A., is slight, yet brilliant and effective. The "Approving Critic," a peasant urchin standing before an easel, with a lighted candle in his hand, possibly contemplating his own portrait—for the back of the picture only is seen—is one of those droll conceptions which are always identified with W. Hunt's figure subjects: the copy is inimitable. All these last-mentioned prints are published by the lithographers, Messrs. Hanhart. We see the name of J. Coventry upon most of the prints, as the artist who has transferred the originals to the stone; we are bound to compliment him upon the satisfactory manner in which he has executed his respective labours—not a very easy task it would seem to us, to imitate the various styles of the artists whose works were placed before him.

BLACK'S PICTURESQUE TOURIST OF SCOTLAND. Published by A. & C. BLACK, Edinburgh.

The words "twelfth edition" on the title-page of this book render it almost unnecessary for us to add anything by way of recommendation, especially as former editions have received our favourable notice. We are told in the preface to this new issue, that the work has undergone a thorough revision and correction—the information in several instances having been entirely re-written, from notes taken during tours recently made expressly for this edition. It certainly appears to contain all the tourist can desire to know, while the subject-matter is conveyed in the simplest and most ready form. We observe that the map of Scotland which is introduced, is printed on thin cloth instead of the usual material—paper: this is a vast improvement where reference has so frequently to be made to it by the traveller.

THE STRANGER'S HANDBOOK TO CHESTER AND ITS ENVIRONS. By THOMAS HUGHES. Published by T. CATHERALL, Chester; J. R. SMITH, London.

It is an undeniable fact that hundreds, nay thousands, of Englishmen, and Englishwomen too, are far better acquainted with certain parts of continental countries than with their own; and yet nowhere has nature spread out with such a lavish hand such temptations, in the way of the picturesque and the beautiful, to woo the traveller to home enjoyments as he may easily find within the limits of Great Britain and Ireland, if he will only look for them. We have no desire to place a bar across the harbours of Dover or Folkestone, at this or any other season of the year; but we have "a pretty stiff notion" that if the Englishman entertained only half an idea of what there is to be seen between the Land's End and John o' Groat's House, and across the Irish Sea, he would feel little disposition to explore the marvels of other countries, at least until those of his own are exhausted. This propensity for foreign travel, almost to the entire neglect of our own country, has within the last few years grown to such an extent that the subject has at length been taken up by some of the leading public journals—and not before it was needed—with a desire to turn the thoughts of their readers to the sources of health, enjoyment, recreation, and instruction that surround us at home. Here, for example, is "rare old Chester," a city the like of which is not in Europe—full of antiquarian interest and stirring historical associations, and envied by landscape scenery that is sweet and soothing to look upon. Though our recommendation comes rather late in the season, it may not be too late to advise those who have a week or two yet to spare out of town, to take a run thither and explore its beauties and antiquities with Mr. Hughes's excellent guide in their hands; and we would tell them who have not such an opportunity, that, as the book is full of illustrations, they may receive from it a good idea of what is to be seen both within and without the walls of the city.

PAINTING WITH BOTH HANDS; OR THE ADOPTION OF THE PRINCIPLE OF THE STEREOSCOPE IN ART, AS A MEANS TO BINOCULAR PICTURES.

By JOHN LONE. CHAPMAN & HALL, London. An artist of our acquaintance, for many years past holding a distinguished rank in his profession, but whose earlier life was occupied in painting for the stage, once told us that scene-painting was "capital fun; you see, we have our colours in pailfuls, we get a long-handled brush about as big as a birch-broom, and then we go boldly to work with both hands." Making all proper allowance for the enthusiastic exaggeration of our friend in his description of scene-painting, we do not suppose that his method of working is exactly that which Mr. Lone advocates in his pamphlet; and yet we should have been half-inclined from the writer's remarks to think it is, were it not for a note on one of the

pages, which informs the reader that his plan is to employ two pencils at the same time, one in each hand. How this is to be done, however desirable its adoption may be, we are not told; nor can we imagine how it would be possible so to direct each eye to its corresponding hand as to watch its operations and note its doings. But, supposing even this difficulty overcome, painting being an effort of the mind as well as of manual labour, what artist could fix his thoughts on two separate and distinct objects, or portions of his picture, at the same time, so as ultimately to combine them into one harmonious whole? In truth, Mr. Lone's theories are ingenious, but fallacious, to our notion—for we cannot see how the principles of the stereoscope can be applied to the art of painting: the stereoscope does not create the picture—it only serves to show it to us in a peculiar and true aspect; it is nature, or in the case of painting, the artist, who makes the picture: the man and the instrument do not stand on equal terms with respect to the work each has to perform.

THE BRITISH WORKMAN.—THE BAND OF HOPE. Published by PARTRIDGE & Co., London.

There is nothing more cheering than to find "angels amongst us unawares;" and these publications—which we have put together, as being under the control of the same editor—go a long way to prove the fact that such are labouring earnestly for the "workman" and the "child." Both publications deserve the patronage of every employer and landholder in the kingdom, and should be found on the table of the "workman" as well as in the cottage of the peasant. We cannot recommend these cheap and admirable works too highly. Mr. Smithies deserves to be classed amongst the philanthropists of modern times, labouring as he does in comparative obscurity, and yet diffusing a mild beneficent light among "the people." Both THE BAND OF HOPE and THE BRITISH WORKMAN are miracles of cheapness; and many of the illustrations would do credit to our own pages.

PHOTOGRAPHIC PORTRAITS OF LIVING CELEBRITIES, Nos. 1 & 2. Executed and published by MAULL & POLYBLANK, London.

An attempt, and by no means an unsuccessful one, is made in this work to supersede the labour of the engraver, by the camera. The portraits given in these respective numbers are those of Professor Owen, and the Right Hon. T. B. Macanlay; the former is excellent—bright, intellectual, and life-like; the historian and essayist is just the reverse—"His eyes are heavy, and he fain would sleep."

The contour and the physiognomy of the man are here, but they convey a very imperfect notion of the brilliant historical romancer of the nineteenth century. A short biographical notice, by Herbert Fry, accompanies the portrait of each "celebrity."

GRACE HAMILTON'S SCHOOL DAYS. By EMMA JANE WORBOISE. BINNS & GOODWIN, Bath.

There are numbers, young and old, who will be greatly pleased with this volume, as it contains more than the ordinary incidents of school-girl life, combined with much that is sound morality and religion. But books intended for the amusement as well as the instruction of youth should avoid all manner and appearance of lecturing—the moral should spring out of the incident without force or constraint; the young do not like being trapped into a lesson or a sermon when they expect a story; and when any extra reasoning is indulged in, it should appear inevitable—not to the writer, but to the reader. The introduction of poor literature into a school is a serious evil, and cannot be too cautiously guarded against; but girls who have passed the years of childhood are naturally prone to seek amusement, during their leisure hours, in light literature, and every establishment should have a well-selected library, with which education has apparently nothing to do. We say "apparently," because everything is education until the mind is formed; and those who are properly skilled in training well know that taste, feeling, expression, truth, honour—all the higher as well as the beautifying qualities of mind and matter—can be taught without reference to a school-book or a lesson.

A TREATISE ON THE CURE OF STAMMERING. By JAMES HUNT, M.R.S.L., &c. Published by LONGMAN & Co., London.

To those who are afflicted with the distressing ailment this book may be very strongly recommended; it is the production of a gentleman of great intelligence and much knowledge, who inherited from his father (long famous for the cure of this defect) the duty of lessening it, or removing it, by a system based upon common sense, careful study, and matured experience.

THE ART-JOURNAL.

LONDON, OCTOBER 1, 1856.

THE NATIONAL COMMISSIONS.

THE WELLINGTON MONUMENT.

WE have good grounds for believing that the cause of the British sculptor will find a larger advocacy in the next session of Parliament—when questions deeply affecting his interests will have to receive their settlement—than it has met with for many years past. The treatment to which he has in more than one recent instance been subjected, has at length arrested the attention of those who can render powerful assistance in a matter in which this Journal has ever been willing to do earnest battle; and the feeling which has long been our own is spreading amongst those who have another voice and audience than ours for its utterance—that it is high time the artists of England should have some clear and distinct understanding of the relations in which they stand to the public works of the country. The manner in which questions of competition for the execution of such works have occasionally been solved of late, by those who represent the Government action in this matter—and a part of whose office as such representatives it is to assist by the means at their disposal in fostering a native school of Art—has startled many into a remorseful recollection of the fine creations of the chisel which year by year have illustrated that school, and given it a place second to none in Europe. Forms of power and shapes of beauty rise up in men's memories, to rebuke the official neglect which passes them carelessly by, the official insolence which waves them superciliously away, or the official obliquity which sees only the Art that comes to it from abroad. The too frequent use of the foreign tongue in our Art dedications is reviving the passion for the rich, sweet language of our English Academe. A sense at once of national wrong and of national waste is stirring in the public mind; and we are glad to know, that some who can question with effect are prepared to question, when the proper time shall come, the ministerial doctrine which holds it part of the official privilege to deal with the artist according to the minister's own good pleasure, and regards the national monuments as pieces of private patronage, to be dispensed at his caprice.

The Sentari job has not been without its redeeming incidents. While it has disgraced our Arts—which it affects to represent—abroad, and wronged our artists—whom it affects to ignore—at home, it has brought the feeling of national injustice and national oversight which we have been describing to a point of sensitiveness that must find vent in determined

expression when the House next meets. This is the compensating law of extremes:—a great evil often generates a great good. In morals, as in physics, out of corruption we get wholesome life. The Sentari job was so monstrous, that it startled even the parliamentary conscience, familiarised with monsters as that conscience is. For ourselves, we have been unable up to this hour, and with all the aid that we have sought, to penetrate the mystery by which that job has been surrounded; and when the large proportions of the job are considered, our readers will see that more than common pains must have been taken to make the cloud thick enough for its effectual concealment. The monument did, however, grow up to its full estate in the dark:—and may, by the by, owe a portion of its deformities to that unwholesome condition. No hint that such a creation was in progress did the public receive, by any of its organs, till the work had been shipped away, to proclaim to the East, in its inflated language, that we have no sculptors of our own in England,—and that same public was requested, in an off-hand manner, to pay for the proclamation. The sum of £17,500 was coolly demanded for a declaration of British Art-incompetency:—embodied in Art-phraseology, the adoption of which by Englishmen operates as a further proclamation to Europe, at their own expense, of their utter want of taste. In the days of Charles I., when our country looked abroad for its Art, it did take care that the Art should at least justify the importation. But the whole of this Sentari monument affair is extremely curious. When the monster job was first produced in Parliament, a feeling of surprise—judging by our own sensations, we should be inclined to say panic—seems to have paralysed the Houses. A random shot or two was, it is true, aimed at it in each House; but, under the influence of these feelings, feebly and with no effect. In the Lower House, Lord Palmerston saw his advantage, and fired a great gun. The monument, he said, “was of extreme beauty:”—and Mr. Bowyer at once went down before the shot. The honourable gentleman has, however, we are happy to say, recovered,—and we expect him in the field for our native sculptors next session. In the Upper House, the tactics of Lord Pannure were, as our readers know, equally bold and still more remarkable. When the Earl of Harrington charged with the British sculptors, the war secretary declined to meet them in full front, but by a dashing manœuvre he turned their position. To quit the metaphor, he gave the House to understand—and, we are informed, without the slightest trepidation of voice or hesitation of manner—that, in matters of the kind, it was useless to apply to “the sculptors and artists of this country,” as it was well known that these gentlemen could not be induced to compete for the public works! Of course, we reckon on the House having received with considerable scepticism the circumstance thus offered by Lord Pannure as the spring of the foreign movement:—of the astonishment of the sculptors themselves at the statement we know something. It was the first intimation to them of the fact of their having as a body “struck” against the Government. They are, we believe, anxious to have it understood that this is not so; and we venture to state, on their behalf, that they hold themselves free to condescend, on any fair and open scheme, to the lucrative commissions which the country has to offer.

We have spoken of the monster proportions of the Sentari job,—and the question of mere *dimension*, our readers will think, is tolerably well expressed by the figure of £17,500 as the price paid for a column. But the question of *proportion*, as regards scale, is best illustrated by an example; and that example will, at the

same time, serve as an illustration of the estimation in which a Government, that can be so lavish in matters of Art when it pleases, holds the native sculptor. After the exhibitions of British talent held in Westminster Hall, twelve years ago, the question of decoration of the new Houses of Parliament came, as our readers know, under the notice of the Royal Commissioners of the Fine Arts; and, as the first sculpture fruit of their deliberations, it was determined to commission English sculptors to execute twelve statues of England's worthies for St. Stephen's Hall. For the first two of these commissions given out, the sum paid was £1200 apiece; but then, the Commissioners began to feel that, as they were dealing only with their own countrymen, the estimate was too liberal,—and the price to be paid for the remaining works was reduced to £1000 each. For *twelve* statues, then, by English sculptors, chosen as the result of a general competition, before the Pannure strike had set in—statues designed at once for the artistic and the historic illustration of our great national palace,—the price paid was £12,400. For the *one* Sentari Monument, got up no one knows how, and given to a foreign sculptor no one can tell us why, the remuneration—demanded from Parliament without explanation, and granted with scarcely an inquiry—is, we repeat, £17,500. About half as much again for the single work sent abroad to announce to the nations the death of native sculpture in England, as for the sum of all the twelve set up in St. Stephen's Hall, to prove to our children's children how vigorous and life-like at that very time our native sculpture was!

Our readers know, that, amongst other national works of the kind on which the Government action will have ere long to be exercised, the scheme of the long-deferred Wellington Monument has expanded, in their hands, into such proportions as make it of the utmost importance that the commission shall keep free of all taint, and the resulting work soar above all cavil. Into the particular circumstances of the case we shall have more specifically to enter later in this article; but we desire here to urge, that the matter involved is quite as important to the public as it is to the artist himself. The great sculpture prizes in this country are comparatively few—painfully few, when we remember what great sculptors there are amongst us; and when such prizes do occur, to take the children's Art-bread and give it to the stranger, is at once unnatural, uneconomical, and unpatriotic. Other governments so understand the case,—and sustain their national monuments by the national art, and the national art by means of their national monuments. The opposite course could be justified anywhere only by a deficiency at home of the art, or a superfluity of the monuments:—with us the art is great, and the opportunities are few. No such sculpture prize as this of the Wellington Monument has England had to give for many years past; and her own sons have surely a right at once to the material benefice involved, and to that more spiritual reward which the great artist derives from his connexion with a great national work. So much for the sculptor:—now for the public. Where the people have so large a sum to bestow on Art—for this sum *is* the people's,—they have a right to expect that it shall go to feed the arts of their own country, in which they have a deep interest. It is not the same thing to any nation whether its monuments be the work of its sons or the work of the stranger, so the art be equal. In the last case, a nation has in its monuments the incident of beauty and the means of instruction; in the first case, it adds to these the pride of production. Art is universal, no doubt:—but it is a part of the greatness of an individual nation to build her

a native home; and in order to do this she must encourage the native builders. Is Rome illustrious for the works of Art which she accumulated, in the same sense that the Greek cities are which produced them? Besides, there is an idiosyncrasy in nations, which renders it questionable whether it be possible for any other than the national genius ever to give a true and adequate expression of the national hero to the national heart. The foreign phrase is almost sure to detract something from the full English feeling of the sculpture-song of triumph. In subjects which may be treated more or less as abstractions or generalizations, this will be felt in greater or less degree; but a monument to Wellington—like a monument to Nelson, or one to the first Napoleon—is, amid all the largeness of its theme and of its scope, a work emphatically and intensely individual and national.—For these reasons it is, and because we know, as we have said, that there are those members who are prepared to maintain in Parliament the views which they involve,—that we think it well, in the meantime, before either the decision shall be taken in the matter, or the discussion shall arise, to lay down, for consideration, some of the principles which seem to us essential to be kept in view, if we would arrive at a result in which the public mind shall fully acquiesce, and which shall leave to the sculptor no reasonable ground of complaint.

There are three several modes in which commissions for the national monuments may be dealt with by those having the responsibility of their distribution. The first is, that which selects arbitrarily *one* tried and well-known talent for the execution of an important work of Art. In this course, the government commissioning rests its responsibility on an established reputation, which is a credential won by repeated successes and bestowed by competent authority. The minister has the guarantee of the artist's previous performances, and of the professional character which he has personally to invest. Nevertheless, it must be observed, that, subject to these securities, the particular work in hand is thus committed to the merey of a single accident,—and, to make the guarantee complete, it would be necessary to assume that a rich mental soil will yield an equal harvest on all occasions. The other reasons which have been urged in objection to this course are:—that it is one which lends itself to jobbery in its abuse, and which, even in its honest use, tends to create a monopoly of Art-employment in a few hands. Another—and just the opposite—course which may be adopted, is, that which received its first public recognition in the well-remembered government competitions in Westminster Hall; and which, summoning the universal body of English artists to an unrestricted competition, had the beneficial effect of bringing a mass of talent out of greater or less obscurity into the strong light of day, and helping to strike a balance which the accident of patronage tends constantly to disturb. To this course, however, besides that for ordinary purposes and individual works of Art, it is unwieldly and impracticable, there are objections of a very serious kind. Seeing that the commission can go finally to only one sculptor, as the prize of the labour and the thought that produced the model, it is no light matter to multiply that labour and that thought by scores, and to have nothing but the disappointment to offer in return for the great sum of the exertion that the summons has called into play. In the case of fifty candidates, for instance, exactly fifty times the work is done that is intended to be paid for; and the lost time and anxieties of forty-nine artists go to enhance the triumph of one. The amount of aspiration recklessly invoked and wasted, is a thing to grieve over, where that aspiration was in itself wholesome, as

founded on a real and sufficient power;—and yet more so, where it was not. The announcement of a general competition brings into the field—on some vague dreamy hope of they scarcely know what—young and inexperienced artists, who lavish their fancy—irrespective of means, and unconscious of the grand epic simplicity of sculpture—on models which, should they unhappily attract the prize, the sculptor tyros would be wholly unable to carry out on the scale demanded. These are some of the evils which render general competition a scheme to be avoided, save in a case, and with an object, so exceptional as those of the Westminster Hall exhibitions. The third course which may be followed in the commissioning of the public monuments, is one which combines the advantages of the other two. It adds to the principle of selection the principle of competition;—makes known eminence the *general* qualification in a joint appeal, more or less extended,—and leaves the *particular* qualification to be won out of this by competing models from the individuals answering to such appeal. This last method—of limited competition—from its reconciling qualities, has become the favourite practice of our time wherever the commissioning of works of Art is a trusteeship; and was, for example, all but universally adopted in reference to those monuments which arose all over the country after the death of Sir Robert Peel. All the objections incident to general competition are eliminated by the fact and the manner of the limitation. For instance,—the reduction of the competitors to a given few, enables the commissioning body to assign to all others than the prize model a sum sufficient to pay the mere labour and expenses of the unsuccessful artists, on a scale adjusted to their rank:—and this is a course that we should desire to see always followed in the case of the Government commissions, and in all others in which the funds are sufficient for the purpose.

But, in order that the principle of competition, whether general or restricted, may have any wholesome operation at all, it is absolutely essential that all the incidents and conditions of the competition shall be stringently observed. There can be no deviation after the fact from its prescriptions without a violation of its constitution. The principle of the thing, it has been well observed, is so delicate, that it can flourish only in an atmosphere of perfect conscientiousness. The conditions on which a competition was originally summoned make the law of its being, are binding on all the parties concerned, and cannot be ignored or altered, in whole or in part, by any one, without the consent of all. The terms of such a challenge are, within its wider scope, as precise and obligatory as is a direct engagement with a single sculptor. With each one of the sculptors so brought into competition, the government, supposing it to be the summoning party, has made a conditional contract, as it has made an absolute one with the body of the whole;—and the interest of each can be defeated only under the conditions which he has himself accepted. The subject is most important. Whatever is most wholesome in the principle of competition becomes most mischievous by the perversion of its laws; the right at which it aims is readily convertible into a wrong. For instance, any personal leaning, on the part of the judges, towards some one of the artists engaged in a competition, is an unconscious acting on the narrower principle under the false pretence of the larger one. In a word, the principle of limited competition, skilfully applied and conscientiously worked, seems to combine all the best securities and conditions for obtaining the best work that can be had on any given occasion; but evasions of many kinds have been practised under it, that defeat the very ends for which it was devised, and are gradually

rendering it unpopular with the profession. Some of these forms of evasion it will be convenient to point out,—drawing only from real instances within our own knowledge,—in order that we may do what in us lies to bring this instrument into good working order by the time when it will be needed for the Wellington models.

In the first place, then, our readers are aware, that this very Wellington Monument itself has been already the subject of a wrong such as we desire to denounce. They know the circumstances under which the late Sir William Molesworth invited to a competition for this work four eminent sculptors,—Mr. Baily, Mr. Gibson, Mr. Foley, and the Baron Marochetti:—and each of these sculptors was carefully informed, as one of the elements of the competition, who were the other sculptors against whom it was intended that he should have to compete. Mr. Gibson, who resides abroad, and the Baron Marochetti, who seems to have preferred relying on his private influence, declined the competition,—and the contest, consequently, lay, of course, between our two eminent English artists, Mr. Baily and Mr. Foley. Both these gentlemen sent in models for the work,—of neither of which, however, did Sir William Molesworth approve; and the artists, then, following the course usual on such occasions, offered to make such modifications as might suit the minister's views, or to supply fresh models. Sir William, however, intimated, that it was not intended to proceed further in the matter;—and a rumour got abroad, that it was designed to *give* the commission quietly to the Baron Marochetti,—one of the recusants in the proposed competition! The rumour may or may not have been well-founded,—though, what has since transpired in the matter of the Scutari Monument gives it every appearance of probability. Mr. Baily, however,—who is at the head of the profession in this country, and whose works are, after those of his great master, Flaxman, the highest illustrations of the English school,—undertook, on behalf of the body of British sculptors, to vindicate the principles assailed; and a correspondence took place between him and Sir William Molesworth, and afterwards with Sir Benjamin Hall, which, if it failed to obtain the justice sought, in all probability prevented the job intended. The principle which Mr. Baily laid down was this,—and to any but official organs it will probably seem clear enough. When a sculptor is invited to furnish competing designs for a national monument, and, as one of the conditions of his competition, is informed of the names of those against whom alone he is assured that he will have to contend,—he naturally concludes, that the statement which represents the extent of the chances against him, represents also their limitation,—and that somewhere within the area of selection so reserved by the government to itself, the commission must fall as a matter of contract. It is, thus, with a full knowledge, as he believes, of the risks and the prospects offered to him, that the artist enters on this species of conditional engagement in case it suits his views. "For myself, I avow," said Mr. Baily,—and I suppose that the avowal represents the feeling, on the same subject, of my brother artists,—that I would not enter into any competition in which it was understood that the authority summoning it retained within his own breast any right or condition not apparent on the face of the challenge which invited me. *That is not competition*, in any reasonable sense of the word, for which it may ultimately be declared that there was no prize." On his own position and Mr. Foley's in the competition, with reference both to the models supplied and to the offer of each to make fresh ones, Mr. Baily reasoned to the following

effect. When a commission of this kind is given directly and at once to a *single* sculptor, the party giving it either takes his chance of what the sculptor will send him, good or bad,—or, as is more reasonable to suppose, he expects that sketches for the work shall be submitted to him before they are carried out; and though the commission itself is held to be absolute, the design made under it is to be approved ere it becomes the national monument. A commission to four takes exactly the place of this commission to one. Here, too, the engagement is absolute,—not with one sculptor in the first instance, but with that one of a given number of sculptors whose designs shall be most nearly to the taste of his judges. But, as in the case of the single sculptor, the sketches of the sculptor so coming out first of many, have to be shaped and modified according to such suggestions as may offer, until they meet the final approval of the parties responsible to the country for procuring a satisfactory work of Art. These repetitions and modifications are precisely what the two sculptors had offered to make. “The original call to compete,” said Mr. Baily, “was a commission given amongst four artists:—its individual incidence to be determined amongst themselves in the way prescribed by the call. The field of the commission was subsequently narrowed to two sculptors, by the failure of the other two to compete. To give away the commission now to any other than the sculptors invited and accepting,—above all, to either of the two sculptors who declined the invitation,—would be a wrong of many kinds to those who did accept and work under it, and on its faith. The door of this competition, opened not by me, cannot be shut without my consent.” Whatever may have been the intentions of Sir William Molesworth as regards some other sculptor at the time when this correspondence commenced, it failed, as we have said, to procure the justice demanded for the sculptors concerned. But Sir William Molesworth, by what seems to have been an after-thought,—at any rate, the offer was not made at first,—requested the two competing sculptors to name such sum as they thought severally would be a fair remuneration for the labour and cost which they had incurred in the matter. This, Mr. Baily, for himself, refused to do;—and Sir William Molesworth then awarded to each of the two competing artists a sum of £150. This money, Mr. Baily, seeing that he could obtain nothing more near his claim, received under protest;—a protest which he has since repeated more than once to Sir Benjamin Hall. “I deny,” he says, “the authority of Sir William Molesworth, or any one else, to commute my right under the argument for £150, or any other sum,—or to convert the right into anything else *than* the right itself. I refused then—and I now again refuse—to consider the money as a satisfaction of my claim. If I am compelled to put up with it, as all I have been able to get from Sir William Molesworth or yourself, to represent my right, the right nevertheless remains—in the character of a wrong.”—For some time after this correspondence closed, no further step was taken in the matter of the Wellington Monument,—and what was next heard of it involved such an enlargement of the scheme as at once changed the conditions of the case. The sum proposed to be devoted to the work for which Mr. Baily and Mr. Foley were competitors was £5000; but it now appeared that the money voted by parliament for the funeral honours to the great Duke had left a residue of some £25,000,—and the whole of this sum it was considered might appropriately go to the crowning and abiding honour of the monument,—thus commanding a work on a great scale, suited to the large proportions of the subject, and reflecting credit

on a country not over-rich in high-class monumental illustration. By its passage into this new phase an easy and natural solution of the matter in dispute was attained. The principle of right had been resolutely asserted on behalf of the body of British sculptors,—and the menaced or suspected wrong had not been committed by the Government. The models which the two sculptors had prepared were, of course, in any view of the case, insufficient for the extended scale of the commission,—and the right to £5000 was not necessarily a right to £25,000. Something of a right there, doubtless, still remains,—but it is not easy to define it in the new scheme. Practically, all that the two competitors in the lesser project can well now demand is, that they shall be the first artists invited into the enlarged competition which we assume will be summoned for the execution of the great Wellington Monument.

It is curious to observe, how surely this laxity of practice in the matter of Art-competitions, as in other things, has descended from headquarters to the subaltern stations of power and responsibility,—how faithfully corporations and committees, in their several degrees, reflect the haltings and obliquities of the Government whenever they have to imitate its action. Apart from the duty of consistency for its own sake, governments might learn to feel more strongly their responsibility for every step which they take if they only noticed how all the moral time-keepers of our provincial towns set their watches by the great clock in Downing Street. It is not very long since circumstances took place in the good town of Leeds—in the matter, too, of one of these very Wellington monuments—which, but for their precedence in point of date, might be looked on as a parody of the London competition affair,—and which, as the matter stands, reflect the unsound principles in the management of such affairs that have been extracted from the practices of the highest authority. But, as generally happens in cases of second-hand action, the thing was awkwardly done at Leeds. They cannot perform their jobbing in the provinces with the grace of the metropolis,—where a job is enacted after “the high Roman fashion.” In London, a minister answers a remonstrating artist with an air and tone indicating a sort of surprise that an artist should expect a reason at all:—in Leeds, they *did* reason on their wrong,—and this was a blunder where the case was not reasonable. A London secretary of state would refuse, along with a certain authority whom our readers will recall, to give a reason if “reasons were as plentiful as blackberries:”—a Leeds committee-man volunteers reasons where he has no reason to give. The facts were these. The men of Leeds resolved to have *their* statue of the great Duke,—and placed, as is usual, the management of the fund collected for the purpose in the hands of a committee. This committee proceeded to summon five eminent sculptors into the field of competition,—and a certain number of these sculptors responded to the call. So far, the action of the committee was according to the precedents,—but at this point they struck out a novelty of their own. The contract was after the manner of such contracts elsewhere, and gave, of course, to each of the sculptors invited, and having accepted, a conditional right:—the form of repudiation of that right was original and peculiar. The committee simply affected to overlook, as things of no significance, its own summons and the high Art then working under it,—and quite coolly announced to the distinguished artists concerned, that it had changed its plan of operations, abandoned the scheme of competition, and *given* away the work for which *they* were then competing to a certain *one* of the invited competitors. This was highly magisterial,—and so far, a very good imitation of minis-

terial irresponsibility:—but no minister, as we have hinted, would have done what follows. A contemporary remonstrated,—and the committee, by its mouthpiece, had the weakness to explain. The explanation, in default of being satisfactory, is extremely curious:—but we doubt if we can make it intelligible to our readers. We know, that the sculptors to whom it was addressed have never understood it to this day. It was, however, to this effect,—and is worth giving as a specimen of logic in difficulties. It appears, that two out of the five sculptors invited to compete had declined the invitation,—and thereupon, says the Aristotle of Leeds, the competition was *ipso facto* at an end, notwithstanding the acceptance of the other three. If this were a conditional contract, says the mouthpiece of the committee, the committee had as much right to demand the performance of the conditions as the artists had. Now the conditions, he goes on to say, are these. “If A. B. C. D. and E. consent to compete, the work shall be open to their competition; but A. and B. having declined, the condition was broken, and the contract, if it ever existed, void.” So much for a Leeds “argal!” We confess, we have more than once tried ourselves with this argument as an intellectual exercise,—but have always found ourselves entangled, and glad to escape from its meshes. Take this as an example of the difficulties with which we find ourselves contending. A. B. C. D. and E. are, for the purposes of the argument, raised into a corporation, without their knowledge, (for, it need scarcely be observed, that the application to each several artist took no such form, and hinted at no such condition,)—so that, the refusal of two is a refusal not for themselves alone, but also for the other three, although the other three have for themselves accepted! Well, but then, by the same method of reasoning,—and *à fortiori*, because here we have the majority,—why should not the acceptance of the three bind all the five, notwithstanding the refusal of two,—so that, the recusant two might be compelled, against their will, to work on models for the Leeds committee!—Our readers will see, that we cannot deal seriously with the argument put forward on behalf of these Yorkshire gentlemen; but we have adduced the instance as showing the sort of reasoning to which they who reason on the matter at all are obliged sometimes to resort, in the attempt to justify their unceremonious dealing with some of the names most dear to the Arts of the country.

While the instances which we have given are instances severally of a great injustice committed as between the two contracting parties,—there are, besides, various forms of an injury, consciously or unconsciously, done, or attempted to be done, by some advantage, of one kind or another, given to some one or more of the competitors over the rest, after the competition has begun.—Of these forms of injury we will refer to two, as instanced in cases known to ourselves; and these two may stand for the rest,—because the principle in all is the same. In matters of competition, it is quite clear that the terms must be precise and final, in order that they may be equal for all,—and that men who are working under inequalities of condition are not *competing* in the strict and logical sense of the word. If a subsequent alteration of the original terms be made—whether as regards time, for instance, or any other element of the competition—in favour of any one or more of the competitors, of which the whole had not the benefit, it is obvious that this equality of condition is disturbed. Take *time*, for instance; and, as we have hinted, we have a case before us in which an extension of that element *was* sought to be allowed by the committee having charge of the competition, even after certain of the com-

peting models were finished, and had actually been sent in! The wrong here seems very glaring;—yet the proposal was made only in thoughtlessness, without the least intention to do a wrong, and was at once abandoned when it was perceived in what way it would operate as a wrong. First, the artists who completed their work within the time prescribed had probably, for that object, to lay aside other arrangements, and the profit attending on them, (and with two of the competitors we ourselves know that this was, in fact, the case,)—which arrangements they might well have reconciled with the work of the competition, if they might have had the extra time now demanded for some other of the competitors. That these other competitors needed the extra time, was simply because they did not put aside their other arrangements, to enable them to comply with the terms which they had accepted. If the time were sufficient for one, it must be supposed to be sufficient for the rest:—if more time were needed, it should have been demanded, and given, at first, and for all. To enlarge, afterwards, the time prescribed to *all* in favour of a *few*, is to give to the procrastinating sculptor an advantage out of his own neglect,—and put the sculptor who wrought in conformity with his instructions at a disadvantage precisely *because* he did comply with them.—But this is not all. It is a well understood principle in competitions of the kind, that it is an injustice to give to any competitor the opportunity of working on his designs after the designs of another have gone from his studio,—or even after they have been completed *in* his studio, unless he has, for his own convenience and at his own risk, completed them earlier than the time fixed. A competitor so unfairly working, has obviously a chance given to him of embodying hints not originally his own, and drawing the prize of thought which was due to another. It is not a sufficient answer to this, to say, that in the latter case the sculptor can guard his own studio,—and as regards the former, that no one but the judges will see the works. To a certain extent this is doubtless true:—but in either case, the early designer is at the mercy of accidents.

Another form in which an allowed departure from the prescribed conditions of an Art-competition has wrought injustice more than once, may be illustrated by the second of the two instances to which we referred above. In, we think, the year 1848, the council of the Art-Union of London offered the sum of £100 for an original bas-relief in plaster, on certain specified conditions. One of these conditions, we believe, actually prescribed the very *measure* of the impost,—but, at any rate, the work was to be a *bas-relief*. Twenty-five competing works were sent in; and the prize was adjudged to a work of great merit, very well deserving of a prize. To the particular prize which it obtained, however, it had no title whatever;—not being a bas-relief at all, but a work of very high *rilievo*. A bas-relief could, of course, have no chance against it for effect; and consequently, the other competitors, who doubtless would have wrought also under the bolder conditions had they not supposed them inadmissible, are wronged for their compliance with the terms imposed on them, in favour of the artist who defied the terms. A prize is here offered for one thing, and given for another! The prescribed impost was a positive law of the competition,—and the prize is given to him who broke that law! The terms laid down, are so laid with the direct purpose of ensuring uniformity of qualification,—and he is crowned who disturbs the uniformity by the introduction of a new qualification, in his own favour! A certain number of artists are set down to the game of Art-competition, with rules made expressly for securing fair play,—and he is

allowed to win who plays avowedly with loaded dice! By the law to which the losing artists conformed, the character of the work to which the prize was given did, in effect, exclude it from the competition. Not to compete on the terms laid down as constituting the competition, is really not to be a competitor,—and so, the winner of this prize won it without competing! The prize was given away *outside* the competition, as tested by the advertisement of the council themselves.—Now, all these forms of laxity in the handling of the instrument of competition make that instrument operate simply as a snare. Once more, we say, all must be clear, precise, open, fair, and equal in its use, if it is to have a beneficial action in helping the public to great monumental works.

There is one circumstance which is too commonly overlooked in the commissioning of the national monuments,—and which, yet, in the case of any monument is of great importance to the law of its completeness:—we mean, the assignment of the site which it is to occupy. No great work of sculpture can fulfil all the conditions of its being which has not a premeditated reference to the accidents amid which it is to stand. The Athenian sculptor, who finally missed no one quality that was essential to the perfection of his art, gave full effect to the architectonic principle in sculpture. Both the grouping and the character of a great monument will be to some extent determined or modified by the nature of its surroundings. The painter makes his own background, and fits it to his incidents,—the sculptor has his background given to him, and should have the opportunity of adapting his incidents to that. A great work of sculpture falsely placed, is like a great thought injured by some flaw in the grammar which expresses it. A grand monumental group composing badly with the objects about it, is like a choral harmony hurt by a discord. Every commission for a national monument should be accompanied with a communication of the place in which it is to stand,—and independently of the intrinsic merit of the work itself, an element of the competition should be its fitness for its place. With regard to the Wellington Monument, the scale on which it will now have to be executed, should Sir Benjamin Hall's proposal for the appropriation of so large a sum of money to its execution be carried out, renders it probable that it will have a location somewhere in the open air:—in which case, in this foggy land of ours, it will have to be cast in bronze. Under these conditions, the fit site for such a monument seems almost to proclaim itself. The large area at the back of the Horse Guards, over which the warrior Duke presided so long, and from whence the moral of his presence will never depart—in this generation at least,—expressly offers itself for the monument in question. This space *wants* a monument,—and the monument in question will want just such a space. There is room here for the great scale to be uninjured by the too close interruption of surrounding objects; and the fine natural and architectonic features which would group at this spot with his sculpture masses, are amongst the things which the artist will have to consider when he designs this great national work.

But, when all these requisites towards a fair trial of the strength of the country, for this important national monument, shall have been secured, there is one essential yet to be demanded, without which all the rest are thrown away:—and that is, a competent tribunal. If there be really any one thing, beyond the irregularities of its application, which discredits the doctrine of Art-competition amongst us, it is the knowledge on the part of the artist of the sort of judges to whom, in too many cases, his pretensions have to be submitted. That the

duty of selection should imply some knowledge of the qualities to be selected, reads like a truism when we write it down,—but is very commonly rejected as if it were a fallacy in practice. The utmost purity of intention cannot secure justice to the artist on the part of a court which is ignorant where the justice lies. In the hands of incompetent judges, there is little doubt that the tendency of competition can only be to lower the standard of sculpture,—by occasionally giving to mediocrity the sanction of the excellence over which it appears to have triumphed, and inaugurating the bad in Art with the solemnities due only to the good. An uninstructed Art-tribunal, with the best purposes, has errors of many kinds lying in wait for it. Even where it might chance to judge well of the relative values of the works submitted, it has no means of judging of their relative practicability. With such judges as have at times assumed to themselves the decision of Art competitions, the showy and complex will be too apt to prevail over that clear and simple, yet elevated, sculpture utterance which is the high poetry and consummation of the art:—but the mischief does not end there. Models are too often sent in to sculpture competitions which the clever modellers could not themselves carry out on the large scale at any price, and which no sculptor whatever could execute at anything like the price offered. Of all this, in most instances, the unprofessional judge knows little or nothing. It is not for us to suggest the constitution of a tribunal which should command the confidence at once of the public and of the profession:—save, that we may say, it should contain enough of the professional element to ensure the necessary knowledge, and not enough to leave professional prejudices or jealousies without the needful counteraction. We would recommend, too,—as has been recommended in the memorial which a large and leading body of British sculptors recently addressed to Sir Benjamin Hall, and which has been published in this Journal,—that in all cases of government competition, “a public exhibition of the models of all competitors should precede the selection of any one of them.” It is highly desirable, in all contests for the public monuments, both for their own sakes and for the sake of the final work, to have the opinions of the people—subject to such correction by competent authority as we have described. Such an appeal before the result would tend to give satisfaction to the public and authority to the selection. In the atmosphere of so large a supervision, the job could scarcely flourish. The judges would thus, as it were, be giving judgment in open court,—instead of sitting, as is too generally the case, with closed doors. The Government itself ought to be desirous of dividing its responsibility in the matter of the public works of Fine Art, and securing as much of the public consent as it can. The time has gone by when it can affect to look on the Arts of the country as the affair of coteries. The esoteric is opposed to the spirit of the age. The people are fast learning Art; and as the public monuments are amongst the books of instruction from which they have to read, the Government should adopt all the means by which it can have its editing most perfectly and most conscientiously performed.—We believe, that the observance of the views which we have in this article sketched out, in all cases of sculpture competition, would, as we have said, leave the competing sculptor without any ground of complaint,—or, at least, without that public sympathy in respect of his complaints which now gives to them most of their significance and force.*

* Since this article was written, Government has invited the competition of artists for the monument—we have also where referred to the proposals.

BRITISH ARTISTS: THEIR STYLE AND CHARACTER.

WITH ENGRAVED ILLUSTRATIONS.

No. XIX.—J. M. W. TURNER, R.A.

EW, if any, painters, whether ancient or modern, have caused so much discussion among Art-eritics as Turner: while some have extolled him as the greatest landscape-painter the world has seen, others regard him as little better than an artistic madman: he has been the jest of one party—the idol of another; nor is this much to be wondered at, if we call to mind the peculiarity of his works as well as their originality, for the whole range of Art-history affords nothing analogous to them. Each year that has elapsed since his death, in 1851, has only served to confirm the opinion we expressed in the biographical notice that appeared in the *Art-Journal* a month or two afterwards, and which we now repeat:—"It is no disparagement to the many artists whom he has left behind, to affirm that we have lost in him the greatest landscape-painter of the English school; we should scarcely say too much if we add, of any other—ancient or modern." We are quite willing to east in our lot with those who venerate his genius, though by no means, as some do, to the entire exclusion of every other artist. It was truly said by an anonymous writer more than twenty years ago, that "the glorious superstructure of the British School of Landscape, in part erected by the united powers of Wilson and Gainsborough, has now in our times received its final acme of excellence, its triumph of beauty and grandeur, from the genius of Turner."

Had Mr. Ruskin, in his ardent and enthusiastic admiration of the works of this painter, showed a more just appreciation of the talents of his contempo-

raries, we believe that Turner would have been a considerable gainer; but the indiscriminate laudation of his idol, at the expense of, and in comparison with others, created, there is little doubt, a wide-spread feeling of opposition to the opinions and sentiments of the author of "*Modern Painters*," and through him to the subject of his eulogy: an injudicious friend often inflicts more injury on the cause he advocates than its avowed opponents.

Our opinion of the works of Turner, and the estimate we have formed of his genius, have been already recorded; it is unnecessary to travel over the same ground again; we shall only refer to our previous notice for a few facts which require to be stated in this place, and then fill up the pages at our disposal with such remarks of our own, and of other writers, as they occur to us, and are suited to our purpose.

Turner was born in 1775, in Maiden Lane, Covent Garden, where his father carried on business as a hair-dresser; he had, however, sufficient discrimination to allow his son to follow the pursuit to which he was most inclined. How and where his earliest studies in Art were carried on we have no precise information; we only know that he was largely indebted to Dr. Munro, who possessed an extensive collection of water-colour drawings, for permitting him to copy them under his own immediate direction and advice. The doctor's collection was rich in the works of Paul Sandby, Rooker, Cozens, Hearne, and others whose names are now almost lost to the public, and in sketches by Gainsborough. Turner and Girtin, as well as the late John Varley, Francia, Edredge, &c., were among the disciples of the Munro school, as it was called, and "occasionally copied and studied from the same prototypes. From the elaborate and tasteful delineations of Hearne and Rooker they acquired the rudiments of a just and accurate insight into the properties of topographical design; and from the drawings of Cozens a practical knowledge of breadth and simplicity, united with the charms of aerial perspective." To Turner and Girtin, between whom an honourable rivalry existed—for both seemed equally gifted with genius and perception, and alike endued with executive powers—are we chiefly indebted for the high position which our school of water-colour painters has reached. Girtin unfortunately died at the comparatively early age of twenty-seven, in 1802; had he lived to the years of his fellow-student, there is little doubt he would have achieved a reputation second only to that of Turner—for their merits were so equally balanced, and the drawings of one bore so

close a resemblance to those of the other, that no one who has not very carefully studied the works of both would be able to distinguish between them. We are speaking of those executed when the artists were fellow-pupils, or soon after that time, for Girtin in his latter years launched out into a more free and a bolder style than Turner did at the same period; while the drawings of Turner during the last thirty or forty years of his life are as unlike his own earlier productions as they are to those of any other painter:—latterly

"None but himself could be his parallel."*

* After the above paragraph was written, we incidentally met with the following passage in Mr. Ruskin's last volume of "*Modern Painters*;" it occurs under the chapter

Turner entered the schools of the Royal Academy in 1789, and in the following year he sent his first picture, a drawing in water-colours, to the

headed "Of the teachers of Turner:—"What help Turner received from this or that companion of his youth is of no importance to any one now. Of course every great man is always being helped by everybody, for his gift is to get good out of all things and all persons; and also there were two men associated with him in early study, who showed high promise in the same field, Cousen and Girtin (especially the former), and there is no saying what these men might have done had they lived; there might, perhaps, have been a struggle between one or other of them and Turner, as between Giorgione and Titian. But they lived not, and Turner is the only great man whom the school has yet produced." Mr. Ruskin here falls in with our own opinion, only he gives to Cozens—not Cousen, as he calls him—the position with regard to Turner that Girtin should have.

Exhibition—the subject a view on the Thames, taken from the banks of the river, nearly opposite the episcopal palace at Lambeth; three years afterwards he exhibited his first painting in oil. Two pictures he exhibited in 1800 attracted great attention, the “Falls of the Clyde,” and the “Teuth Plague of Egypt”—subjects very dissimilar in character, yet both distinguished by masterly treatment. To show how varied were the subjects painted by him in the early part of his career, we would instance a picture which many years ago was in the collection of Lord de Tabley; it represented a blacksmith's shop, in which was a butcher, who appeared to be disputing with the owner of the forge his charge for shoeing a pony: all the implements used by the smith were introduced with remarkable truth and firmness of painting, while in the foreground of the picture were groups of poultry, finished almost as highly as if they had come from the pencil of Houdekoeter, or Jan Fyt.

The early pictures of Turner have so rarely passed under our own observation, that there are but few—and with those the public generally are almost as well acquainted as ourselves—on which we ought to venture an opinion. Mr. John Burnet, who perhaps knows them better than any other individual, and certainly is as well able to offer a critical remark upon them as any one else with whom we are acquainted, has recorded the following observations upon their peculiar features:—“The early compositions of Turner are of a simpler character, and contain fewer parts than his later works; this not only arises from his being engaged on representations of extensive scenery, such as the

embellishment of engraved subjects demanded—where a multitude of objects was required to be given in a small space—but also from his changing his conduct of light and shade from a breadth of shadow to a breadth of light, which gradually expanded to almost a want of solidity in his last paintings; this was also the reason for adopting a more brilliant style of colour—for objects to be rendered sufficiently distinct, without cutting up the breadth of light, could only be produced by the contact of hot and cold colours. In these pictures he more resembles Wilson and Claude than in his later pictures, both on account of largeness of forms and his breadth of shadow.”

Speaking, in the chapter to which reference has been made in the preceding foot-note, of the Art-education of Turner, between whom and Walter Scott Mr. Ruskin presumes a kind of mental relationship to exist, he thus writes:—“Turner, from the beginning, was led into constrained and unnatural error; diligently debarred from every ordinary help to success. The one thing which the Academy *ought* to have taught him (namely, the simple and safe use of oil-colour), it never taught him; but it carefully repressed his perceptions of truth, his capacities of invention, and his tendencies of choice. For him it was impossible to do right but in a spirit of defiance; and the first condition of his progress in learning was the power to forget. . . . Turner acquired his knowledge of architecture at the desk, from academical elevations of the Parthenon and St. Paul's, and spent a large portion of his early years in taking views of gentlemen's seats, temples of the Muses, and other productions of

[J. and G. P. Nicholls.

modern taste and imagination; being at the same time directed exclusively to classical sources for all information as to the proper subjects of Art. Hence while Scott was at once directed to the history of his native land, and to the Gothic fields of imagination, and his mind was fed in a consistent, natural, and felicitous way from his youth up, poor Turner for a long time knew no inspiration but that of Twickenham, no sublimity but that of Virginia Water. All the history and poetry presented to him at the age when the mind receives its dearest associations, were those of the gods and nations of long ago; and his models of sentiment and style were the worst and last wrecks of renaissance affectations. Therefore (though utterly free from affectation) his early works are full of an enforced artificialness, and of things ill-done and ill-conceived, because foreign to his own instincts; and, throughout life, whatever he did, because he thought he *ought* to do it, was wrong; all that he planned on any principle, or in supposed obedience to canons of taste, was false and abortive: he only did right when he ceased to reflect; was powerful only when he made no effort; and was successful only when he had taken no aim. And it is one of the most interesting things connected with the study of his art, to watch the way in which his own strength of English instinct breaks gradually through fetter and formalism; how from Egerian wells he steals away to Yorkshire streamlets; how from Homeric rocks, with laurels at the top and eaves at the bottom, he climbs at last to Alpine precipices fringed with pine, and fortified with the slopes of their own ruins; and how from temples of

Jupiter, and gardens of the Hesperides, a spirit in his feet guides him at last to the lonely arches of Whitby, and bleak sands of Holy Isle.”

Mr. Ruskin arrives at the conclusion that the classical education of Turner “hindered or hurt him;” we do not think so; but Mr. Ruskin sees no beauty in the architecture of Greece and Rome; we do, although, with the author of “Modern Painters,” we have a decided preference for the Gothic; and therefore, because we admire both, we derive as much pleasure from looking at Turner's “Building of Carthage” as from his “Dogana, Venice,” or any other of his later Italian scenes. We conceive the difference of merit in his pictures throughout the whole of his life is not so much of kind as of degree; and it puzzles us to understand how any one of pretension to a feeling for the beautiful in Art can stand before the “Carthage,” the “Bay of Baie,” or the “Daphne and Leusippus,” and speak of them, as the “Oxford Graduate” does, as works which, “with infinite accumulation of material, are yet heartless and emotionless, dead to very root of thought, and incapable of producing wholesome or useful effect on any human mind, except only as exhibitions of technical skill and graceful arrangement.” What is it that constitutes a great painter as well as a great poet or other writer? The faculty of originating noble ideas, and of describing them in lofty and truthful representations, equivalent to language, so that the mind of others receives the impress of their grace, beauty, and power.

Had Turner's Art-education been transferred from classical mythology to Gothic legends, England would never have seen a large number of the best pic-

tures of her greatest landscape-painter; and those, too, upon which we are satisfied his fame must ultimately rest, inasmuch as they will, after a few years, be the only surviving exponents of his genius. Mr. Ruskin even acknowledges that, "while making drawings of flower-gardens and Palladian mansions, Turner had been taught sympathy with whatever grace or refinement the garden or mansion could display, and, to the close of life, could enjoy the delicacy of trellis and parterre, as well as the wildness of the wood and the moorland, and watch the staving of the silver fountain at its appointed height in the sky with an interest as earnest, if not as intense, as that in which he followed the crash of the Alpine cataract into its cloud of wayward rage." How much, it may be asked, which Mr. Ruskin sees of the true and the beautiful in Turner may not be traced to the lessons he learned "while making drawings of flower-gardens," &c.? It seems only reasonable to presume that his mind at that period imbibed such sympathies and acquired such tendencies as led him to the deepest study of material nature, and onwards from what, for want of a better expression of our meaning, we may call the "trivialities" of that nature to the development of her grandest and most brilliant characteristics. Who can tell by what processes of thought and intelligence, inspired first of all by the influences of some simple home-scene, his mind and imagination rose to the perception of those marvellous creations which deserve to take their place by the side of the descriptive passages of Shakspeare and Milton? What these men are in poetry Turner is in Art. Engraving will transmit to posterity some of his greatness; by it his compositions will endure, though his magic colouring will, we fear, be lost.

In the year 1800 Turner was elected Associate of the Royal Academy, and two years afterwards, at the early age of twenty-seven, an Academician. Such a rapid rise to the full honours of the Academy has, we believe, no parallel in its history.

We remember seeing, several years ago, at the gallery of Mr. Griffiths, in Pall Mall, three pictures, hanging side by side, so entirely differing from each other in style and character that no one could possibly have supposed them to be painted by the same hand. With the exception of one, we cannot call to mind the subjects, but each was an example of the style practised by him during the three periods into which his Art-life was divided. The picture that has left its impress—an imperfect one, however—on our memory was a large landscape—trees and mountains, with heavy, rolling thunder-clouds, such as Gaspar Poussin would have painted; all the forms and details marked with vigorous and decided touch, the colouring rich and full, but deficient in those soft and delicate half-tones, which constitute half the charm of his subsequent works. We may regard as specimens of Turner's first epoch the three pictures in the National Gallery; of his second, the two Venetian views in the Vernon Collection; and of his third, the majority of the pictures painted within the last twenty years of his life. Some of Turner's critics divide his works into two classes only—his dark and his light manner. The "Venice," engraved on the preceding page, is an example of the "light" style, and our other two illustrations of the "dark."

In writing of Turner on a former occasion, we remarked, "that the present generation must not sit in judgment on his works;" its ears have heard too

THE FALL OF CARTHAGE.

[J and G. P. Nicholls.

much of the contradictory evidence, so to speak, and the feelings have been too strongly excited by one or other of the counsel who have argued the case, to admit of a totally unbiassed opinion; moreover, they are not to be understood by a mere superficial inspection, but require close study, united with a considerable knowledge of the true principles of Art: a bare acquiescence in, or denial of, the merits of any picture, particularly of one by such an artist as Turner, without a reason for or against, is the verdict of ignorance, and must stand for nothing. And yet how many persons are there who judge the artist upon no other evidence than their own "untutored minds," or vague and uncertain notions of what is truth? Undoubtedly, the question, "What is truth?" would naturally occur to many individuals possessing a knowledge of Art on looking at some of Turner's pictures, and the reply would as naturally be dictated, not by the established rules of Art, but by each person's own conception of it—by what he believes, because it is present with him, or, at least, is thought to be so; for through the eye the understanding becomes enlightened, and belief is confirmed. Yet what we look upon may be so transformed from its original state, so dressed up in the garb of adventitious ornament as to convey a very imperfect, and even erroneous, idea of the reality. Thus, if a person stands upon some lofty eminence at eventide, and sees a rich and luxuriant landscape stretched out before him, and the distance closed in by the towers, and spires, and edifices of a densely-populated city, every portion of which is steeped in the brightness of the setting sun, the picture would be brilliant to the eye and

pleasant to the imagination. But let him descend from his elevated position, and minutely examine the scene which has elicited his admiration, the illusion would vanish at the sight of stagnant pools and marshy swamps, and uncultivated fields, and wildest thickets, and the dwelling-places of want and misery, vice and crime—there would be no charm in the reality, though much in the aspect under which it is seen. Is there, then, a departure from Truth in either case? Certainly not; for both are alike portions of the same visible creation, their apparent difference being the difference of circumstances under which they are seen.

With all Turner's apparent singularities and inconsistencies, his pictures contain the best materials for a fine work of Art, and show their author in the light of a great poet-painter. We could point out many of his works which are perfect epic poems, wherein grandeur of conception, vivid fancy, and beauty of language, as spoken by the pencil, have not been surpassed by any writer. But the meaning, as we have just observed, is not to be got at in a momentary glance, any more than a canto of Spenser's, or a drama by Shakspeare, can be understood and appreciated by one who runs as he reads; for the imagination must be called into exercise to fill up many seeming vacuities of subject-matter, and the mind must be imbued with a feeling in unison with that of the painter. His pictures are often a study of profound, sometimes almost inexplicable, mysteries, but well repaying any amount of time and thought which may be bestowed upon them—they are allegories of nature, wherein her loveliness and grandeur are overlaid with a gorgeous manifestation of Art.

THE FÊTE SALOONS OF BADEN.

THE "Palace of Conversation," the name given to the edifice in which the visitors to Baden assemble *pour passer le tems*, has, somewhat recently, under-

gone a vast transformation. The former building, erected under the "administration" of M. Benezat, sen., a Parisian gentleman of considerable wealth, who had become the presiding genius of Baden, having been found too contracted in size for the yearly increasing number of visitors, M. Benezat, jun.,

who succeeded, on the death of his father, in 1848, to his distinguished post, signalled his accession to the direction by rebuilding a portion of the "palace" on a scale of magnificence that cast all the splendours of its predecessor, great though they were, into the shade. Four new saloons were added, re-

THE BALL AND CONCERT ROOM.

spectively called the "Pompadour Saloon," the "Flower Saloon," the "Saloon of Louis XIV.," and the "Ball and Concert Room;" engravings

from the two last are here introduced. They are taken from an interesting and well-illustrated work, entitled "*L'Eté à Bade*," by M. Guinot, of Paris,

and published by M. Bourdin, to whose courtesy we are indebted for the loan of the cuts.

The "Saloon of Louis XIV.," the name given to

THE SALOON OF LOUIS XIV.

it from the style of its architecture and decorations, has an arched ceiling and a cupola ornamented with sculptures and allegorical paintings. On the panels of the wainscot are arabesques ingeniously interlaced on a groundwork of gold. The "Ball

and Concert Room" is in the style of the *renaissance*: the ceiling is designed in compartments that inclose, in an open-work "balustrade," a sky in which hover an aerial orchestra of winged figures, cupids, and genii; in the corners are allegorical

figures distinguished by their attributes. The four saloons were erected from the designs, and under the superintendence of, M. Séchan, assisted by MM. Dieterle and Haumont: the whole of the works, from the floors to the ceilings, were executed in Paris.

THE HOUSES OF PARLIAMENT.

IN our last notice of the progress of the decorations of the Houses of Parliament, we had occasion to observe that the pressure of the war had retarded the less necessary parts of the buildings. The substantial portions of the works advance, but the frescoes and Fine Art embellishments have for the last two years been in a great degree in abeyance. This, at the commencement of such a war as we have just concluded, was to be expected. The series of statues in St. Stephen's Hall has not recently received any additions. The only painters at work are Mr. Dyce, Mr. Ward, and Mr. Cope. It is now two years since we noticed at length Mr. Dyce's subjects from the life of King Arthur, in the Robing Room; some were completed, others were advanced at that time, but the series is not yet finished. Mr. Ward and Mr. Cope are preparing their cartoons in the Clock Tower. The only additions that are now actually being effected are the bronze reliefs in the Prince's Chamber, by Theed, the plaster casts for which we noticed some time since in the studio of the artist. A composition in plaster, coloured like bronze, has for a lengthened period occupied a place over one of the fireplaces, for the purpose of trying the effect of such a work. The subject is, "The Queen of Edward III. interceding for the Lives of the Burgesses of Calais," and when this bas-relief was first placed there, we ventured to express a hope that it was not set up as a model of style, as it was pointedly in the monkish taste of the fourteenth century, with that kind of perspective which represents the figures standing in a plane inclined downwards to forty-five degrees. We are glad, we say, that these compositions have not been brought forward in that spirit, although we see that the devices in the stained-glass windows are characterised by a most objectionable mediæval infirmity of drawing, and false perspective—defects which, of course, are intended to identify them as much as possible with early style. But we must submit that, inasmuch as these works were the very best Art that that period could afford; so should all the embellishments of the Houses of Parliament be executed in a spirit to represent the state of Art at the present time. Barbarous Art has always been considered necessary to Gothic architecture—the conjunction is an article of architectural faith; yet are we so heretical as to desire improvement. If the style of the composition over the fireplace in the Prince's Chamber were set up as a suggestion to the taste of the sculptor, it will be a source of satisfaction to all who may see these works that he has ventured to depart from this prescription, and to essay to qualify his works with the best spirit of modern sculpture. Of these compositions two are in their places—"Lady Jane Grey declining the Crown," and "The Trial of Catherine of Aragon." In the former there are but two figures—Lady Jane, and, we presume, Northumberland; that of the lady being a conception of much sweetness and delicacy. Nor are there many in the latter, wherein Catherine is kneeling before the king, having on her left two cardinals, and on the right the judicial officers of the court. Those not yet placed are—"Sir Walter Raleigh spreading his Cloak for Queen Elizabeth to tread on," in which, from a desire to give importance to the queen, the figures are too close to each other; "Queen Mary Stuart on her Voyage from France to Scotland" is a relief of much elegance, and very skilfully disposed, considering the difficulties to be dealt with. Facing the entrance from the Royal Gallery is the niche intended for the reception of the statue of the Queen, which will shortly be settled in its destination. Between the smaller bronzes there will be others, equal in size to those over the fireplaces, and above these are panels for pictures; but in this room, as in so many others of these vast suites, the light is ill-calculated to show works of Art, especially bronzes, which for their details require a powerful light; but it must be observed that the most important chambers are indifferently lighted, while the committee rooms and minor offices, especially those above the ground floor, receive an uninterrupted breadth of daylight. The difficulties in the way of the most advantageous disposition of these numerous chambers are very great; but the inconvenience will be felt to the exclusion of this consideration. Now, with respect to the Prince's Chamber, we have to observe that

the objects selected for its embellishment are altogether inappropriate. There is in our history an amplitude of material for the embellishment of a "Prince's Chamber," without touching upon subjects suited only for the resorts of deliberative gravity. The decorations of this room might have more appropriately commenced with some incident in the youth and education of Alfred; then, perhaps, some like instance from the early life of Edward the Confessor. The Norman princes were not distinguished either for public virtue or filial piety, but for the sake of serial consistency one example might be chosen from their variegated biographies. Then Edward's nomination of the first Prince of Wales, followed by reminiscences of the Black Prince—Prince Henry and Judge Gascoigne, with other similar subjects, bringing the narrative down to our own time; and, instead of a statue of her Majesty, for which a more fitting abiding place could be found, the niche should be filled by a statue of the Prince of Wales—such embellishments alone are those suited for a "Prince's Chamber." The restoration of Henry the Eighth's Chapel has not yet been commenced; it is earnestly to be hoped that the proportions of this beautiful interior will not be disturbed; the only fault in its construction is that it is too low—if the floor could be sunk, such a change would infinitely assist the effect. The Peers' Cloak Room is advancing towards completion. This is a chamber vaulted in Caen stone—the arches springing from columns of very massive construction, and meeting at their crests in a florid device. The fireplace, which is elaborately carved in Caen stone, is contained within one of the arches. A scroll—which, by the way, is rather stiff—occupies the place of the chimney-piece, bearing inscribed on it in old English letters, "St. George," "St. Andrew," "St. Patrick," surmounted by shields respectively bearing the national cognizances of one of those countries. This crypt-like chamber is lighted by painted glass windows, each of which displays the armorial insignia of a peer; an upper composition presenting the vizored helmet, with the crest, and sometimes the cap of maintenance, sometimes the coronet, and a lower shows the shield, below which is the style of the peer, and the initial letter of his Christian name. Among the peers whose armorial bearings are thus set forth are the first Duke of Marlborough, the Duke of Greenwich, the Earl of Oxford, &c. This chamber is in a line with those that run immediately parallel with the Guard-Room Court, the Peers'-Office Court, the Boiler Court, the Cloister Court, and the Star-Chamber Court, and the range of offices above face the Abbey and Old Palace Yard, being abundantly lighted by windows of ample dimensions. These rooms are plainly furnished, being vainscoted round within three or four feet of the floor—the panels containing that neat and simple device which prevails throughout the Houses of Parliament, and is cut, we believe, by machinery under Jordau's patent. Some of the ceilings are coffered, others are plain, but all are painted in imitation of oak. The fireplaces are ornamented with a ribbon instead of a chimney-piece, wherein is inscribed, "Fear God—Honour the Queen," or, "God save the Queen," in order to remind the gentlemen who may be employed in these rooms at once of their allegiance and their religion.

At the commencement of the building of the Houses of Parliament we expressed a hope that the utmost care would be exercised in the selection of a stone that would preserve, if possible, the sharpness of the carvings which were exposed to the atmosphere of London. To all who have seen the venerable rags in which the elder of the colleges at Oxford, and many of our public buildings now stand, this could not be otherwise than a question of much importance. All the Caen stone employed is within the buildings, being too costly, and of a nature too perishable, for exterior work; and the indigenous material of which the edifice is principally constructed was, we remember, selected from among others which recommended themselves by their qualities of resistance to atmospheric influences. Notwithstanding such care decomposition has already shown itself in the buildings, so distinctly as to attract the attention of the legislature. The circumstance was brought under the notice of the House of Commons on the 20th of June last, and mentioned in the House of Lords, by Lords Lyndhurst and Harrowby, in July. Our attention has been called to certain portions of the external surface, amounting in all to fourteen hundred square yards, which have been

coated with a preparation called Daines' Patent, which appears to arrest the decomposition of the stone. If this can be effected it will be a most valuable discovery, not less to architecture than to sculpture, as the most delicately carved details may be exposed to the outward air without fear of that dissolution which has destroyed the most beautiful of our ecclesiastical sculpture. Could, for instance, the front of Wells Cathedral have been subjected to any such process as that to which we allude, we should possess in that structure alone an example of mediæval sculpture as beautiful as anything of its kind and period in Europe. The opinion of Sir Charles Barry of this method of preserving stone is full of interest. He says, "I have carefully examined the three portions of the external masonry of the new Palace at Westminster, which were covered with the stone preservative solution about two years since; and I have the pleasure to inform you that I have reason to be perfectly satisfied with the efficiency of the solution, with reference to the object of its application. It seems to have checked all the efflorescence arising from exudation from within the body of the stone, and all vegetation on the surface due to atmospheric influences. The absorbent properties of the stone, which are mainly the cause of all decomposition in that material, are to a considerable extent obviated by the indurated coating on its surface produced by the solution, which is so hard as not to yield freely to the stroke of the chisel, and even to be capable to a certain extent of bearing a polish. In those portions of the stone where symptoms of decay existed at the time of the application of the solution, no signs whatever of decomposition now appear, nor, indeed, in any other portion of the surface of the stone subjected to the process. Where, in one instance, the solution was applied to stone which had long been exposed to the atmosphere, and had acquired a considerable amount of its filth and impurities, a dark and disagreeable colour is the consequence; but where, in the other instances, it was applied to newly-faced stonework, or such as was not in a filthy state, the colour is by no means objectionable." Such is the report of Sir Charles Barry, and it is more reliable than any interested representation. We shall look forward with some interest to the inquiry about to be instituted into the subject.—When the Houses of Parliament were commenced, a time was assigned for their completion, and the majority of the living generation hoped to see these works finished; but half a generation has already passed away, and there is yet much to be effected before even the most recently proposed additions can be entered upon. When we walk round the works, and see what yet remains to be accomplished, we scarcely can see our way to the commencement of the proposed additions—the building on the north side of Palace Yard; the building on the west side of New Palace Yard, including the entrance gateway; the building forming the centre of the front towards (the new) St. Margaret's Street, and southwards to St. Stephen's Porch; the building in the proposed new quadrangle of New Palace Yard, west of Westminster Hall; the Speaker's stables; alterations of the front of Westminster Hall; purchase of block of houses in New Palace Yard; removal of St. Margaret's Church; raising the roof of Westminster Hall; purchase of houses for the enlargement of Old Palace Yard. At the present rate of the progress of the Fine Art decoration, half a century will not see this department completed; which of us then can promise himself that even his children shall see the whole accomplished? Since the above was written we find that the statue of the Queen, intended for the Prince's Chamber, is arrived, and is now being placed in the niche opposite the Royal Gallery. It is by Gibson, and has been executed by him at Rome. The statue is supported by three other figures personifying Astronomy, Commerce, and Architecture; and we believe that the sculptor intends to colour his work. There are many reasons why this statue should not be placed in the Prince's Chamber. In the first place, as a statue of the Queen, it is not suited to the Prince's Chamber. The apartment is comparatively small, and this work will be found too large for it, reducing to nothingness everything else in the room. Again, the light in the apartment is not sufficiently powerful to show the detail of bronze reliefs; when, therefore, a marble statue is placed in opposition to these works, they will become entirely invisible.

THE ROYAL PICTURES.

HYDE PARK IN 1851.

J. D. Harding, Painter. J. B. Allen, Engraver.
Size of the Picture 2 ft. by 1 ft. 10 in.

It was a perfectly natural desire on the part of the Queen to possess some pictorial record of the great "Peace Congress," as it has not inaptly been called, which London witnessed in 1851, and which owed so much of its success to the influence of her Majesty, and the exertions of her illustrious Consort. The "Exhibition of all Nations" called into action a host of artists of all kinds, who illustrated it internally and externally in all its variety of details, and in every possible mode of treatment; and doubtless a considerable number of these pictorial works found their way into the presence of royalty; but the Queen wished to have a picture painted expressly for herself—one that should be commemorative of the event, and yet not too circumstantial in its character—a picture of the locality and its visitors rather than a portrait-like representation of the building which—

"— Like a wondrous vision rose
Where the green turf luxuriant grows,
And stately elm-trees nod;
Where, in the pleasant months of spring,
Through the tall boughs young voices ring,
And o'er the verdant sod,
Mingled with roll of chariot-wheels,
And tramp of horses' iron heels.
"It stood all glittering in the day;
No pile of marble, stone, or clay,
As palaces are reared;
But a vast edifice of glass,
Through which the merry sunbeams pass;
Arched roof and walls appeared
As if some hand with magic strong
Had stretched those crystal aisles along.
"And thither from remotest bound
Of the 'wide earth's encircling round,'
Came men of every clime,
Laden with all that mind conceives,
Or human industry achieves,
Or science holds sublime;
From east to west, from south to north,
Their tributary gifts poured forth."

Mr. Harding received the royal commands for the picture just as the doors of the Crystal Palace were about to be closed to the public. The honour could not have been conferred upon one better qualified for the task; and yet, with a recollection how often the subject had already been the theme of the pencil, he must have felt the difficulty of imparting to it anything of an original and novel treatment. But this artist is never out of his element where green sward and waving trees are to be the chief ingredients of his picture, and Hyde Park supplies full materials of this description. The view of the "Palace" is taken from the western end of the park, where the trees are larger and more picturesquely situated than at the opposite end. We see comparatively little of the building; it is almost entirely screened by the continuous masses of foliage, under which groups of visitors, native and foreign, rest and regale themselves, giving a Watteau-like character to the picture. The drawing and disposition of his figures are, as was remarked in the biographical sketch of Harding in the *Art-Journal* of last month, qualities of excellence which must always excite attention in the works of this artist. He knows where to place them so that they shall constitute a pleasing as well as, in an artistic view, a necessary part of the composition. They never seem introduced for any other purpose than because they ought to be there as an integral portion of the work, and they are always so circumstanced, in action and costume, as to appear so.

The picture is in the collection at Buckingham Palace. It illustrates, with reference to the time when, and the circumstances under which, it was painted, almost the closing scene of that great drama which, during so many previous months, had engaged the attention of every civilised people in the world, either as actors or spectators, or both. The first "Crystal Palace," having fulfilled its purpose of enlightening the nations in the Arts of peace, and of engaging them in honourable and peaceful rivalry, has been levelled to the ground, but only like the second Temple at Jerusalem, to rise again in greater splendour; and, with more varied attractions than the first offered, it has now become one of the wonders of the modern world.

PROJECTED AND OTHER MONUMENTS.

THE monumental movement has been very active during past months; and, as English sculptors do not refuse to take private work, though, according to Lord Pannmure, they will not "compete" for the Government commissions, we are likely to have further specimens of our native talent ere long,—unless other bodies shall follow the example of the Government, and call in the foreigner, on the pretext of an English sculpture "turn out."

The inhabitants of Grautham are moving, somewhat late—but assuredly never too late—in the matter of a monument to their greatest citizen, Sir Isaac Newton; and we have heard whispers on the subject which certainly suggest to us misgivings, though we will not just now more particularly allude to them, in the hope that they may not be true. A statue to Newton, even if it shall be determined that the place of his birth is its proper site—and, indeed, why not? since questions of limitation, either in space or in time, are of no force where his mighty name is concerned—will scarcely be confined to a local subscription; and should the project take the larger proportions which are probable, it is to be hoped that more genial and natural counsels will prevail,—and that when a monument to our great astronomer is in question, it will be felt that all the paths on which is written "*sic itur ad astra*" can be trod by Englishmen.

The friends of Sir Henry Bishop are projecting a monument to the memory of that most popular of modern composers:—and the Scotch have somewhat suddenly remembered, after the sleep of a good many centuries, that they have no monument to the national hero, Wallace.

To these instances of monumental commemoration in project, we may add, as one of completed fact, that Lord Ellesmere has recently placed a slab of marble, inlaid with brass, to mark the spot, in the north aisle of Henry the Seventh's Chapel, where Addison has been sleeping for a hundred years.

And we may record that Mr. Noble's statue of the Duke of Wellington, executed for the city of Manchester, has ascended its pedestal, at one extremity of that area—the statue of Peel occupying the other—where a sheet of standing water, so long the strange frontage feature of an infirmary for the sick, has at length given place to a fine esplanade and a very magnificent Fine Art site. We have treated this subject elsewhere.

Nor is it out of place to record among these tributes to the dead a memorial to a good man recently gone from amongst us, though it takes another form than that of the Art-monumental. The Council of King's College, London, have received the sum of £500, to be applied in commemoration of the late Sir Robert Harry Inglis, with, we believe, no other indication as to the identity of the donor than the touching one which records that it is "from one who loved him." Working in the spirit of him whose memory is thus committed to their charge, the council have determined to apply this sum, and any other contributions to the same cause which may reach their hands, in the establishment of a prize or scholarship for the encouragement of the study of modern history and English literature. The precise nature and value of the reward to be thus created must, of course, depend on the final amount of the subscriptions; but Sir Robert Inglis has left behind him many who could come in to this list of subscribers under the same signature of men "who loved him."

The Arctic episode of our day is beginning to yield its melancholy memorials; one of the least sad being a testimonial, presented by the officers recently employed in the search for the missing ships *Erebus* and *Terror*, to Mr. Barrow of the Admiralty, for the good offices rendered by him to them in that touching service,—a service which, if it failed of the leading object for which it was nobly undertaken, has solved the great geographical problem of centuries.*

The Mayor and Corporation of Lincoln are taking measures to erect, in that city, a monument to the

hero and chief victim of the same dreary tale,—Sir John Franklin himself.

Sir Roderick Murchison reports that, in addition to the granite obelisk which now rises—at a cost of between six and seven hundred pounds—on the quay of Greenwich Hospital, to record the devotion of the gallant Frenchman, young Bellot, who perished in the generous cause of Franklin's attempted deliverance, a sum of £1610 has been divided amongst the sisters of the former lamented officer from the proceeds of the subscription.

And, while alluding to the generous part which other nations took in this cry to the rescue, which has had so sad a final response, we may step aside from our direct subject to record our gratification at the fact of the Royal Geographical Society having awarded its founder's gold medal to Dr. Kane, for his services and discoveries in the Polar regions during the American expedition in search of Sir John Franklin.

The war just concluded will no doubt yield its large contingent to our monumental records. The officers of the brigade of Guards already propose to raise a monument to the officers and men of the brigade who have fallen in that struggle. According to the terms of the meeting at which the project was discussed, the thing is likely to be done on a great scale,—and the officers have already appointed a committee to see it carried out, with Sir Alexander Woodford at its head.

A monument to the memory of the gallant and good Captain Lyons is on the eve of completion, by Mr. Noble:—who, by the way, has produced an admirable bust of Sir W. F. Williams of Kars.

Many other works are in preparation to commemorate losses during the war:—of which we shall be able to render a detailed account ere long.

Meanwhile, in the aisle to the right of the great western entrance of St. Paul's Cathedral, a cenotaph has been erected to the memory of certain of those same heroes:—eight officers of the Coldstream Guards who fell at Inkerman. Lieutenant-colonel the Hon. Vesey Dawson, Lieutenant-colonel J. C. Murray Cowell, Captain L. D. Mackinnon, Captain the Hon. G. C. C. Elliot, Captain H. M. Bouverie, Captain F. H. Ramsden, Lieutenant E. Adisbrowe, and Lieutenant C. H. Greville, are the officers thus commemorated. Of this monument a more particular account appears on a subsequent page of the present number of the *Art-Journal*.

It is not out of place here to add, that an imperial decree prescribes the erection in Paris of a monumental column in honour of the army of the Crimea; and our readers may be quite sure that French valour will be illustrated—as it should when the nation is the illustrator—by French Art.

From the close and terrible relation of the Emperor Nicholas to the war, it is also a convenient occasion here to state, that preparations are making in St. Petersburg for the erection of an equestrian statue of that ambitious and baffled autocrat. The site is to be, the square which lies between the cathedral Church of St. Isaac and the palace of the Grand Duchess Marie;—and the pedestal will exhibit on its sides *bassi-relievi* representing four leading incidents in the reign of the czar. The sculptor commissioned is the Baron Klodt:—and we take it, he will scarcely select the march into the Principalities for one of his "leading incidents."

From all these coming war memorials we turn to one intended to record as gallant a deed, done on a far different field, as ever was achieved by the British soldier. The same calm courage which kept him immovable, throughout a summer's day, in the terrible squares at Waterloo, while the French artillery was cleaving through their human walls—and extorted the admiration of the fiery foe who again and again charged and broke against the unflinching rampart,—stood here to meet, with no applauding spectators, a charge more dread and a destruction more certain,—mixed up with an ancient chivalry and a modern tenderness which gave to the laurel that day won a touch of the true immortal. Our readers will not have forgotten the wreck, on the 25th of February, 1852, of her Majesty's ship *Birkenhead*,—a large troop vessel employed in carrying out to the Cape of Good Hope drafts of various regiments, under the command of Colonel Moore, to the number of six hundred men, besides a crowd of women and children. The only boats available were filled by the soldiers, amid the terrors

* The testimonial, which has been on view at Mr. Nicholson's, in Duke Street, Lincoln's Inn, represents the Arctic regions rising out of an icy sea.

J. D. HARDING PINX.

J. D. HARDING PINX.

HYDE PARK IN 1851.

FROM THE PICTURE IN THE ROYAL COLLECTION.

LONDON: CURRIE & CO. 1851.

of the storm, with these women and children, and sent away from the ship's side; whilst the brave men remained behind to meet the death which they had thus rendered certain,—drawn up on deck, with their officers by their sides and their colonel at their head, as calm and steady as if on parade. Young hearts many of these were, by whom bright prospects were thus self-sacrificed and high hopes self-extinguished for ever; and, in order to estimate the merit of this great deed, it must be borne in mind how all the "pomp and circumstance" which are the inspiration of the battle-field were wanting here. Not to the sound of the rallying trumpet, but amid the roar of the ruthless sea—and not with the prospect of a soldier's rewards, but in full view of the vast and inevitable grave that yawned drearily all around them,—did these gallant men await the hour when the vessel should break up beneath their feet. For these heroes Mr. Gordon, at the close of the session of Parliament, demanded a monument from the nation,—and the first minister declared his willingness to give effect to the demand.—It should be mentioned here, that Colonel Moore, urged by his own soldiers to leave the ship with the last boat, refused to quit his post at their head in the hopeless struggle which was at hand,—and it is very affecting to add that his widow, catching the spirit of him whom she had lost, followed the band of noble ladies who risked their lives in the East to soften the sufferings of the soldier, and *lost* hers:—dying, like her husband, in the cause of humanity. Her name might well have a place beside his on this monument.

Our readers know well that the age in which we are living has been emphatically that of statues and testimonials; but, unluckily, they have not always been the worthiest names that have had the best places in such records. It is not in all cases that the commemorations of brass and marble are for those with whom our sympathies are most warmly engaged,—and we would make many a substitution in the world's list of honours if we had our will. The men who have laboured in the cause of intellectual light, or of moral health, should stand, if we might place them, on the pedestals that have too often been usurped by more vulgar figures. But the clients of the philanthropist are for the most part the low castes of the world,—and these have not often been consulted in the distribution of the public crowns. This, however, is a condition of things which of late there has been some disposition to redress; and, as an instance, a great meeting just held at Bombay has determined to erect, by public subscription, a statue to a man for whom *we* should certainly claim the pedestal of some one of the old world's deposed idols. The object of this public tribute is a Parsee; and men of all creeds and castes in India are consenting to this memorial,—as all creeds and castes have partaken of his benefactions. Sir Jamsetjee Jejeebhoy began life with a few rupees; and has amassed a princely fortune,—which he has dispensed on objects of public and private beneficence to an almost fabulous extent. No less a sum than a quarter of a million sterling is said to have been invested by this great moral economist in works, which testify publicly and permanently the munificence of the philanthropy from which they flowed, and a quarter of a million more in those private charities, the account of which is kept only in the perishable registry of grateful human hearts,—and in the book of the Recording Angel. Schools, hospitals, bridges, waterworks,—whatever could minister to the physical or moral health of the community amid which he lived, like a blessing,—have grown out of his bounty; and the scale of his benefactions takes such proportions as—£1000 remitted for the relief of Irish famine; £750 to the Patriotic Fund; £700 to the Wellington Testimonial; £30,000 (!) for the founding of a benevolent institution at Bombay for the education of the children of the most indigent of the Parsees,—and £20,000 for a hospital in the same city for natives of every caste and creed; £20,000 for a causeway between the islands of Bombay and Salsette,—and £20,000 for a dam (to husband the water) across the river at Poonah. It is said, that he is now negotiating with the Government for the establishment of a School of Design at Bombay,—to which he offers himself to subscribe £10,000. Some years since, the Queen conferred the honour of knighthood on this princely man;—and we see with pleasure,

that a powerful body of persons influentially connected with the affairs of India have waited on the minister, as a deputation, to urge that the memory of such an example may be perpetuated by the perpetuation of the honour that recognised and crowned it,—that Sir Jamsetjee's knighthood may be converted into a baronetcy.

To this long monumental and testimonial record we add a couple of bits that have, more or less, a kind of relation to it—Mr. Hart's portrait of the present Lord Mayor, Mr. Salomons—recently exhibited in the Royal Academy—has, on the requisition of the Court of Common Council of the City of London, been presented by his lordship to that body, for the purpose of being hung in their Guildhall.—And, the late Dean of Westminster, Dr. Buckland—whose death demands a word of specific record in our Journal, for the sake of the pains which he took to let the public have easy access to the monuments and other features of artistic and historic interest in the Abbey under his control, and of the example which he thereby set to the chapters of other cathedrals in England—will in all probability furnish an addition to the list of monumental honours that we may have to record on some future day.

THE NEW PICTURES IN THE NATIONAL GALLERY.

THERE is substantial evidence that the authorities are in earnest in the formation of a national collection. The additions to the Gallery no longer occur at the rate of one picture in two years, but we have to announce an augmentation to our pictorial wealth of numerous pictures, certain of which are already hung, others are not yet placed. Hitherto our national catalogue has only been interesting; but if judicious purchases continue to be effected at a similar, or a proximate ratio, our public gallery will become not only attractive, but must before long vie with all but a few of the famous collections of Europe. Although containing works which in quality yield to none, and in reputation but to few, the National Gallery has been regarded by continental visitors as inferior to private collections, and for a national exhibition only a sorry apology; but a series of such additions as the Francia and the Perugino would raise any gallery to paramount importance. The power vested in the trustees, enabling them to dispose of works indelible to form a part of such a gallery as would be worthy of this country, not only enables them to deal with those works which may be considered unworthy of a place in the gallery, but also solves a difficulty with respect to any unconditional bequests and presentations which may be more or less valuable, but still not sufficiently so for the national catalogue. It is, however, probable that the known existence of such a power will suggest the attachment of conditions to bequests to the National Gallery—conditions that bequeathed pictures shall not be sold, but returned to the estate of the testator if not pronounced of such a quality as to secure them a permanent place in the Gallery. It is well that the public voice should be heard in reference to those additions to the Gallery which are acquired by public money. On the subject of the recent purchases there has been much violent declamation, but all that has been written, all that has been said, is but idle verbiage in the absence of argument tending to show that such pictures are spurious. This has been done in one case, that of the presumed Holbein—the only picture that has been purchased without its history being known. Since the verification of that work, no picture has been purchased without a knowledge of its antecedents. Our National Gallery should not contain one questionable picture; and if proper care be exercised, the entire catalogue will be beyond suspicion. Of the recent additions there can be but one reasonable opinion; and should future selections be made with as much judgment, there will be no ground for complaint, but ample cause for congratulation. There are but two conditions on which pictures can be recommended to the Gallery—the first is unexceptionable quality of Art; the other is, that the proposed work should assist the history of painting by the definition

of an era, or the illustration of a school. It is to be hoped that mere curiosities of Art will never be admissible. The Perugino, which is the most valuable work that has for a length of time been hung in these rooms, was long known as an altar-piece in the Church of Certosa, near Pavia, for which it is believed to have been painted. It was purchased for the National Gallery of the present head of the Melzi family, at Milan, for, it is said, £3600—and had it not been acquired by ourselves, it would now have been one of the gems of the imperial collection at Vienna. Whether this valuable picture passed directly from Certosa into the possession of the Melzi we know not; but it is certain from the fine condition of the work that it cannot have gone through many hands; yet few as these are, it appears to have been touched upon. It is small for an altar-piece, and consists of three compartments, a centre, and two wings. The principal subject is the Virgin worshipping the infant Jesus, who is held by St. John; the *agroupment* is completed by a third figure—that of the youthful St. John. In the upper part of the composition three angels are seen standing on the clouds. The left wing contains two figures—the archangel Raffaele, with Tobias, who carries the fish. The right wing consists of only one figure—that of the archangel Michael, whose sword—

—“From the armoury of God
Was given him, temper'd so that neither keen
Nor solid might resist that edge;—”

and he, the leader of the angelic cohorts, appears, accordingly, in a full suit of plate-armour. The head of the Virgin is a charming study, most successful in its life-like *mormidezza*—the glowing warmth that would yield to the pressure of the finger. The hair is auburn, and painted with exquisite delicacy; but, as usual in all the works of the fathers of the art, the extremities are defective in drawing. The hands are long, bony, and have evidently cost the artist great trouble to paint. All the faces have been finished with a full glaze of sienna and lake, or some other red, which, having, of course, flattened the higher lights, it would appear that some *ignoramus* has been attempting to superimpose these above the glaze, and has left the vermilion so raw that it tells distinctly from the charming glaze with which Perugino finished the picture. If the operations of this mischievous bungler are not to be thus accounted for, it is difficult to find any other cause for them, as the picture does not seem anywhere to have required emendation. In addition to these apparent retouchings, the upper sky of the centre-piece seems to have been repainted. And with respect to the identity of the picture, we have one observation to make, which is, that those Italian writers who speak of Perugino and his works, describe two similar pictures; and with respect to this composition, there appears to be a discrepancy. Should this upon further inquiry be confirmed, we shall quote the passages we allude to in another article. This work is far superior to the small Madouna, by the same master, which hangs near it. The latter is in the dry Florentine manner of the painter, without any approach to the luscious colour of this work. It is also certainly far superior to “St. Catherine” opposite, by Raffaele—the hands of which are coarse, the colour destitute of richness, and the eyes out of drawing. St. John holds the infant, and looks up to the Virgin; in other works of Perugino, as the fresco at Rome, the figures are in much the same relation. The heads also of Tobias and the angel, in the other compartment, repeat this relation. Tobias looks up to the angel in the same manner that St. John looks up to Mary. Thus we may conclude that the heads of Mary and the archangel Raffaele have been painted from one study; as also have those of St. John and Tobias, with a little difference as to size. We cannot believe that these recurrences arose from poverty of resource; it was, however, such monotony that originated against this master the reproach that he continually repeated himself, against which he defended himself by the assertion that he copied no one else. But Perugino saved money, and was exceedingly penurious, and it is probable that he would make one study from the life serve for many pictures rather than pay a model for another. Tobias is presented in a velvet tunic and crimson hose, cut in the most approved fashion of the youth of the end

of the fifteenth century, and on the other side the angel Michael wears a magnificent suit of Milan plate-armour, painted from the reality with the utmost nicety. It is a plain tilting-suit, with the usual lance-rest on the right side—the large shield-like pauldron on the left. The head is lightly covered by one of the fanciful berets of the time. The pose of this figure is neither graceful nor dignified—being that of Donatello's St. George, which forms one of the endless enrichments of the Church of Orsanmichele, at Florence. The angel holds his shield between his divided legs—Donatello could scarcely have imagined a less agreeable attitude. As an example, however, of the master, it is the best of his works that we have ever seen; it is better in colour than, and equal in every other quality to, the "Madonna and Saints" in the Tribune at Florence, and an infinitely more pleasing work than the "Deposition from the Cross," in the Hercules Saloon of the Pitti Palace; the "Madonna and Saints" in the Berlin Museum will not stand a comparison with it, nor will the pictures at the Hague, Frankfurt, and Munich.

The picture by Benozzo Gozzoli represents a Madonna and infant Saviour surrounded by saints; it is a large picture, in the dry and hard manner of the early period of the Florentine school. We have always looked at the works of Benozzo with some surprise that, having been preceded by Masaccio, and as a pupil of Angelico, he should not have ended his figures with more grace than we find in them; but when we remember the amount of work he executed at Pisa in two years, and the crowded altar-pieces which he has painted, it is easily understood that such efforts leave no leisure for accuracy of design. Such a painter is ever impatient of accurate imitation; the work is thus elaborately worked out, but with little observation of nature. This artist groups with the Lippi, the Peselli, and Sandro, and with them was patronised by the Medici. There are three Madonnas, each with the infant Jesus—one by Francesco Tacconi, the other ascribed to Girolamo dai Libri, and a third by Bartolommeo Vivarini. The last bears the abbreviated inscription, "Opus Bartolomei Vivarini de Murano," and was purchased for £97 in November, 1855, from Count Bernardino Corriani degli Algarotti. It is mentioned in the *Atti dell'Accademia di Venezia*. The picture ascribed to Girolamo dai Libri was in the Galvagna collection; but while in that collection it was believed to have been painted by Pellegrino da S. Daniele, and such is the opinion expressed in the work "*Venezia Monumentale e Pittorica*;" but it is stated that, on comparing the work with those of Girolamo dai Libri, it was determined as rather a production of this master. That by Tacconi is inscribed, "Opus Francisci Tachoni, 1489, Octu." It is mentioned in the dictionaries of Ticozzi and Nagler under the article Tacconi. These pictures are by no means so interesting as the Perugino; but if we insist upon the formation of a gallery as entirely of gems, we must be content to possess a collection deficient as an historical series. What we must especially contend for is the authenticity of the works, and if our catalogue is indisputable, we shall at least, in this respect, possess a collection superior to that of every other public gallery in Europe, with perhaps the exception of that in the Pitti. At Berlin, Dresden, Munich, and in the Louvre, there are many ill-conditioned and doubtful works—in every way ill-qualified to constitute parts of collections distinguished by so many of the finest productions of the art. Every well-selected national collection ought to reflect the history of the art, and consequently must contain works of little interest beyond the exemplification of schools. As, for instance, the greater number of the works lately added to the National Gallery, are such as afford little pleasure to the spectator, and no profit to the student—we except, of course, the Perugino and others of that class, which really show that little has been done in religious painting since the date of their execution. If these works are Pre-Raphaelite, we commend them to the observation of the young gentlemen of the spasmodic school, whose modellings in granite may become more plastic by due regard to the quality of these works. It is therefore not only the pictures constituting large national catalogues that are valuable for their beauty and excellence: there are, indeed, productions of certain masters which ought to form a

feature in every large collection, although positively objectionable as to the intrinsic value of their art. To explain what we mean we instance one—Carlo Dolce, who is little known out of Florence. The public infatuation and want of taste is, however, very markedly shown by an ardent desire for copies of some of his works. There hangs in the Italian school, in the Palazzo Vecchio, his "Magdalen," made famous by thousands of copies, commissioned principally by English and American travellers. There are copyists who live by this picture alone—they began the study of their art by copying it forty years ago, and they are yet before it, grey-headed old men. We know not how these men have lived so long near such a picture; it is true the "Magdalen" is one of his best works, his "Poetry" being the other; but Dolce was an icicle, whose works we have never seriously contemplated five minutes without experiencing subsequent tendencies to rhenum and cough.

There is yet a picture which we had almost forgotten; it is a portrait of a young man by Bartholomeus Venetus, and is inscribed, "Ludov. Martinezo, Etatis Ann. XXI., Bartholom. Venetus Faciebat, M.DXXX.XVI. aum." This picture was purchased at Venice, in November, 1855, for £48 10s., from the representatives of the Count Girolamo Michele Pisani, heir of the Count Girolamo Martinezo. The costume of this figure, which is of the period of Venetian splendour, is mentioned in the "*Abiti Antichi e Moderni*" of Cesare Vecellio. A portion of the dress which had been injured has been restored. It is distinctly a Venetian portrait by one of the followers of Titian, but the artist has not made the most of his subject, the face looks mean for want of breadth, and the presence might have been made much more imposing. There are multitudes of portraits for sale in Italy better than this as to Art, but not authenticated as this is, and therefore useless to a public collection—in which the history of every picture should be known so circumstantially as to silence the crude speculation of pseudo-criticism. Fifteen pictures have been purchased from the Manfrini collection alone for the National Gallery—whereon, at the very earliest instance of the Venetian Academy, the Austrian Government has granted funds for the acquisition of seventy works from the same property. As long ago as 1851, the purchase of the entire collection was recommended to the Government by Sir Charles Eastlake, on which occasion Mr. Woodburn was sent to report formally on the quality and value of the works. The result of his mission was, the selection of one hundred and twenty pictures, which were recommended for purchase at a valuation of £22,340, but at that time it was not thought expedient to propose to the Government a purchase so extensive.

There is but one way to consider the recent acquisitions to the Gallery. They have been purchased so judiciously, that the history of each work is known, and all are in unquestionable condition considering the period of their execution. If all future purchases be effected with the same discretion and circumspection, our collection must ultimately be the purest of all those which have been made by purchase since the famous Italian galleries, that were culled amid the splendours of the studios of the great masters.

It is not unreasonable to expect that some portion of the great pictorial wealth of this country will become national property when it shall be seen that there is a place fit to receive, and adapted to show, valuable works of Art. There are distributed throughout England numerous beautiful and authentic pictures, which may be said to be concealed in family mansions in the country. Now they are unknown, but in the national collection they would be seen and appreciated. Mr. Rogers, and other collectors, have lately shown a worthy example; but greater and even more valuable bequests than these may be expected. All the great private collections in the country should be represented in the National Gallery. If contributions are made in certain cases, it is not too much to expect them in others; but presentations now must be only first-class work—none others will be in anywise effective with the character which the collection is now assuming. The brilliant simplicity of recent acquisitions, darkens even the Titians and the Rubenses which we once thought would never be outshone.

MR. HOLFORD'S HOUSE IN HYDE PARK.

THIS beautiful house, we might say "palace," which is one of the objects that make foreigners stare,—inasmuch as it is for the residence of a private gentleman of England,—is about to receive its interior decorations. It is a noble edifice, and worthily adorns the regal situation it occupies in Park Lane; reflecting equal credit to its owner and to its architect, Mr. Vulliamy. Truly it may be said that an untitled Englishman with refined taste and ample means is a king without the trouble of crown and sceptre! With the wide powers with which ample means endow him, he has no vested claims to acknowledge; no responsibilities built up stronger and stronger by generations to crib, cabin, or confine him, but the "world all before him where to choose!" Honour to those who in such an enviable situation choose well! We, of course, in our speciality, deem such to choose well who worthily and with discrimination encourage Art. Mr. Holford's name is not unknown as a Mecenas in this respect, but we now hope still more from him from the step he has taken in the erection of the house we allude to. We are much rejoiced to hear that the internal decoration which is now about to enhance and complete the structure, is likely to be in the hands of an Englishman,—and of one who, we are quite sure, will perform his part worthily. Mr. Stevens, "of Kensington," is already intrusted with the decoration of the dining-room, with respect to which he is given a "*carte blanche*," and this with the full concurrence of the architect, which speaks well for that gentleman's liberality of feeling. Under these circumstances, there is no fear as to the result; nor, we should think, that the whole of the apartments will not eventually be placed in Mr. Stevens' hands. The exterior of the edifice is highly effective in its unity, and is harmonious and complete in itself, from one feeling pervading the whole. The same advantage should be accorded to the interior. We have often had occasion to speak of Mr. Stevens' works in ornamental Art with high praise. The style in which he is strongest is Italian (so called), the most appropriate, on the whole, for English edifices of the class of Mr. Holford's house; yet he is no servile copyist—his compositions, though fully imbued with the full and fervid character of the Italian school, are yet no mere *refaccimenti*—he thinks for himself. In any other European state he would have achieved by this time a much wider celebrity than has as yet fallen to his lot. This arises from no shortcomings on his part, but from the fact of there being no proper "status" yet for an ornamentalist in this country—at least, for a British one. We trust, however, this will, ere long, cease to be the case, and that ornament,—without a strong feeling for which, we reiterate, as we have often done, there can be no true union of the other Arts,—will have its due rank acknowledged. The success we predict in the present instance will give its aid, which we reckon on, inasmuch as our own impression would not hesitate to venture Mr. Stevens' powers in his own style by the side of those of any living ornamentalist, and this notwithstanding that he may be more generally known to the public by the assistance he has given in the best class of ornament connected with stoves and grates than by his other compositions.

This may strike some of our readers as "bathos"—ending our acknowledgment of an artist's talents with a reference to his designs for grates and fire-irons; we, however, do not so deem it, holding that the power of designing a first-rate, high class example of this nature evidences at least probable competence for much more extended efforts! As regards Mr. Stevens, we believe him equal to any efforts in high class Italian ornament; for which he possesses also the peculiar advantage of being equally successful in his effects of colour as in those of form, thus grasping a far wider and more varied range than would otherwise be the case.

Mr. Holford's splendid mansion, Mr. Hope's, in Piccadilly, Lord Ellesmere's, near the Stable Yard, St. James's, and others we could enumerate, unquestionably evidence an improved taste on the part of the wealthy and aristocratic classes, which it is most satisfactory to see.

THE CRYSTAL PALACE,

AS A TEACHER OF ART AND ART-MANUFACTURE.

PART IV.

WE regard the Crystal Palace as a great teacher; if less effectual, not the less powerful because its lessons may be neglected—as those of many public instructors have at all times been; and if in these articles we have seemed to enter more especially for the rich, and those who are able to indulge in luxuries, we are by no means indisposed to give its due weight to the fact that here the people may be taught—that here they may learn. It is, indeed, impossible but that the frequent contemplation of forms of grace and beauty must—inensibly it may be—influence the coarser mind, and induce comparative refinement:—

“The attentive mind,
By this harmonious action on her powers,
Becomes herself harmonious; wout so oft
In outward things to meditate the charm
Of sacred rest, soon she seeks at home
To find a kindred order.”

Our feelings and opinions on this subject have been well expressed by the anonymous author of a small sheet, printed, we imagine, for private circulation; and of which, no doubt, the writer will freely permit us to transfer a portion to our columns:—“The Crystal Palace at Sydenham, with its beautiful grounds—its superb situation, upon a hill, overlooking the rich woodlands of Surrey and Kent, and one of the loveliest districts of country in the world—its

near proximity to the metropolis—its well-ordered attractions in all the Arts that administer to the cultivation of the understanding and the taste—the judicious admixture of the beauties of antique architecture and sculpture with the triumphs of modern Art—and the still more happy blending with all these, not only of the wonders of the vegetable and floral kingdom, but of those geological, zoological, and ethnological marvels, which it is the privilege of this age, and the glory of the scientific men of this country, to have brought to light or methodised,—all these things will give a new and higher character to the amusements of the British people. Were it simply for the beneficial effects which may be anticipated to ensue from this attempt at refining the pleasures of the multitude, we might well be thankful to the far-seeing enterprise of the Directors of the Crystal Palace Company. But, great though such a result may be, it is not the only one that will follow if the palace and its treasures prove but half as attractive as they deserve to be, both to those who have time and money at command, and to those who have little of either. It will educate the people in the knowledge and appreciation of the beautiful. It will aid in the accomplishment of a task which the state has neglected, and which private enterprise never before sought to effect. It will create a taste for the elegancies and refinements of life in the deepest strata of society, and the results of which will exhibit themselves hereafter in an infinitude of modes of improvement, of which we can at present form no estimate. A too exclusive attention to money-making, and a too intense forgetfulness of the public amenities, in the commercial worship of that

great idol—SELF, will be corrected by that love of Art and Nature which familiarity with the treasures of the Crystal Palace will, after a time, induce among the trading and labouring classes. By these and corresponding influences exerted in every direction in civilising the people, and encouraging among them a love of Art, and of intellectual purity and refinement, they would be imperceptibly, but surely, weaned from the coarse and brutal indulgences which have been but too popular, both in town and country, and into which they have been in a manner forced by injudicious legislation, as respects drinking and its accompaniments, and many interferences with their harmless enjoyment. If the new Crystal Palace be as successful in its appeals to the higher faculties and emotions of the public as its predecessor, the Great Exhibition, proved to be, we may anticipate that the next generation of Englishmen will reap many advantages which have been denied to the men of the present day. In the meantime the people will enjoy a place of recreation to which the world can as yet offer no parallel.” And the people do fully enjoy the wholesome and instructive recreation here provided for them; it is impossible for any visitor to the Crystal Palace, on its most crowded day, to perceive in the conduct of the humbler classes aught that may induce a dread that the elegancies and refinements of the place are lost upon them.

The Crystal Palace is yet in its infancy; for what are three years in the great work of education? Yet already, we are assured by competent judges, visits here have “told” upon the thoughts and plans of the artisan. Those who have been half a dozen times within it—and this has been the fortunate lot

THE BIRMINGHAM COURT, CRYSTAL PALACE.

of comparatively few, except such as have been sent as assistants—are far less easily content with mediocrities than they used to be: to suppose otherwise would be to believe nature untrue.

Our allotted task this month is to introduce our readers to THE BIRMINGHAM COURT: it was designed by Mr. Tite; and its principal decorations are derived “from the uses of iron in architecture.” The panels are designed and executed by Mr. Sang. In the centre is a group in bronze, cast by Messrs. Elkington; the sculptor being Mr. John Thomas.

This is a work of considerable merit—of which, indeed, we have prepared an engraving, and it will ere long appear as one of the sculpture plates of the *Art-Journal*. It tells the sad historic tale of “Boadicea.”

But, alas! in reporting the contents of this Court—THE BIRMINGHAM COURT—we are grievously restricted. When we consider what this great town could supply of its wealth in Art-manufacture, and see what it has supplied, we are vexed almost to the extent of indignation that so little is done for its proper and becoming representa-

tion. Except a reasonably good supply of electroplate utilities, contributed by Collis, and a few very creditable objects furnished by Mr. T. Wilkinson, there is nothing of the class of art in which Birmingham rivals Sheffield: while a few spoons and forks, the produce of the works of Messrs. Cope and Son, comprise the whole of an order of “goods” of which Birmingham issues millions every year. Surely, this is not as it ought to be! surely the manufacturers of Birmingham are, to say the least, short-sighted.

There is, indeed, one case of glass that will attract, as it ought to do, very general attention: it is the contribution of Messrs. LLOYD AND SUMMERFIELD. It is constructed to show the applicability of crystal bars or pillars to exhibition cases, as well as to windows, for which they were originally intended. Hence, the case has an appearance somewhat heavy, inasmuch as the pillars are of a size suited to large windows or shop fronts. Improvements have been, we understand, made in the manufacture—especially in the doors, which now move upon concealed hinges, impervious to air and dust. This principle of hollow glass bars grooved has been successfully adapted to fern cases and the aquarium, either for fresh or salt water. An example of this valuable and interesting production is exhibited, and engraved on this page: it is highly creditable to the manufacturers; and Messrs. Lloyd and Summerfield have thus conferred a boon of magnitude on the many who are making a home-enjoyment of the vivarium. It will be at once understood how much more elegant, and how much better suited to the drawing-room, is the aquarium composed entirely of glass, than that of which the pillars and joints are of zinc or iron. We cannot say what is the cost of this beautiful acquisition; but if it be not much greater than that hitherto in use, a great success must follow a great improvement. The large glass case to which we have referred contains several choice examples of cut glass for table use; and on a table in another part of the Court will be found the medallion portrait of Prince Albert, for which Messrs. Lloyd and Summerfield obtained a medal at the Great Exhibition of 1851.

Before we enter the Birmingham Court, however, we will ask the courtesy of the reader to examine a few of the imitations of Irish fibulae (used as brooches), which, although their allotted place is in the gallery, properly belong to this branch of our subject. In our Catalogue of the Great Exhibition of 1851, and also in that which represented the Exhibition of 1853 in Dublin, we engraved several of these interesting works; additions are, however, frequently made to them, as new discoveries are made, or the stores of collectors are referred to. One of the latest and best is that which graces the "up-stairs" stall of Mr. Mahood, who is a dealer in those minor curiosities of Ireland which invite customers by their originality and agreeable variety—such as bracelets formed of the black bog-wood, brooches of Irish gems and pebbles, ornaments made of fish-scales, &c. &c. Such productions have obtained extensive and useful employment for a large number of artisans in Ireland, many of whom are self-taught. They are not often good as works of Art, but they are always interesting; and the sale of them is very serviceable to poor workmen and workwomen, who in that country seldom find occupation that is profitable. These little articles, however, added to the lace and croché, have been the sources of remunerative labour there, and the means of achieving a large amount of good. Every purchaser is, therefore, to some extent a benefactor to Ireland; for to employ the humbler classes of the Irish, is to render essential service to that country.

"The Talbot Brooch"—for that is the name given to Mr. Mahood's example, which we engrave—is so

called in honour of Lord Talbot de Malahide, who is the possessor of the original. In the ancient Brehon laws it is stated that "the size and value of the *aide argiot*, or silver brooch, should be in proportion to the rank of the wearer." The original

fibula being nearly five inches in diameter, of elegant design and workmanship, and one of the largest yet

discovered, we are justified in describing it as an ornament worn by some Irish chieftain of the highest

apple, the animals and hieroglyphics on its surface, are all emblematic of matters connected with Irish history. The above is the exact size this interesting antique has been reproduced by Mr. Mahood, and which he exhibits in the Crystal Palace.

In the Birmingham Court there is a glass case, which contains several of the productions of the famous establishment of Messrs. Jennens and Bettridge, who maintain their supremacy, and excite the admiration they deserve—for it is certain that as examples of papier maché manufacture they defy competition. We might engrave some of these with advantage, or reproduce a few of those which have already appeared in our pages; but having so lately exhibited some of their latest productions, we postpone to a future period illustrations of their merits.

A work in silver, executed as the "TESTIMONIAL" to DR. HASSALL, whose efforts for the public weal in reference to that necessity of mankind—food, have entitled him to public gratitude, is exhibited in this Court. It is produced by Messrs. BARNARD AND SONS, and represents "Ithuriel touching the toad with his spear." The work is of high merit, it is admirably modelled, and may be classed among the foremost of those modern productions which have rescued testimonials from the character of commonplace. We regret that the name of the artist is not inscribed on the base of the statuette, for to him no doubt a large part of the honour belongs, although we have to acknowledge the services of the manufacturer in the cause of Art.

Notwithstanding these accessions, but for the very large collection contributed by Messrs. ELKINGTON AND MASON, the Birmingham Court would be conspicuous for poverty, and would certainly be discreditable to the great town of iron. Their collection is so extensive, and in all respects so admirable, as almost of itself to repay a visit to the Crystal Palace.

Until the formation of the Birmingham Court, the productions of Messrs. Elkington and Co. could only be seen in the gallery of the Crystal Palace; a kind of systematic division has now taken place, which involves a visit both to the court and the gallery, by those who desire to have a perfect acquaintance with the numerous beautiful works exhibited by this firm. Some such division had indeed become necessary, from

the primary arrangement made by the Directors, which excluded manufactures from those parts of the palace which the public generally visited; the consequence of this mistake was—for it unquestionably was a "mistake"—to cast any impediment in the way of the manufacturing interest—that the stalls of the contributors of Industrial Art were comparatively unknown to, and neglected by, many of those who daily and weekly throng to the Crystal Palace. To Messrs. Elkington it was especially unsatisfactory; they had in the gallery a most valuable and extensive display of articles, which might almost as well have been in their own workshops, for the benefit the manufacturers derived from exhibiting them at Sydenham. Even the division is not without some disadvantages, for the accommodation afforded in the Birmingham Court is so limited, that a large and important portion of their stock still remains in the corridor of the gallery.

ran. It is curious to inquire how, in such remote ages, the jewellers could design and execute an ornament of such taste, being very superior in many respects to similar ornaments of the present time. The tracery and representations of the serpent and

The "ILIAD SALVER"—of which we give an engraving on this page—is designed by Mr. Charles Grant, one of the artists employed by Messrs. Elkington, and does him infinite credit. It will be observed that the several compartments are bas-reliefs of subjects taken from the "Iliad;" the centre compartment representing "Thetis supplicating Jupiter to render the Greeks sensible of the wrongs done to Achilles;" the four angular compartments exhibiting her attendant nymphs. The subjects in the two small circular panels are, "Thetis consoling Achilles," and "Thetis brings to Achilles the armour

made by Vulcan." Of the bas-reliefs there are eight; the subjects of them are—"The Contest between Agamemnon and Achilles;" "The Heralds conducting Briseis from the tent of Achilles;" "The Greeks driven beyond their fortifications;" "Menelaus and Meriones, assisted by the Ajaxes, bearing

off the body of Patroclus to the ships;" "Achilles driving the Trojans from the intrenchments by showing himself on the walls;" "The grief of Achilles over the body of Patroclus;" "Achilles dragging the body of Hector round the walls of Troy;" "Priam soliciting from Achilles the body of his son Hector." These sculptured pictures—for such they are—show consummate skill in drawing; although many of them contain numerous figures, each is perfected with rare skill, and will bear the test of the minutest scrutiny as regards either composition or manipulation: the work, as will be seen,

THE ILIAD SALVER.

is very elaborate, and may be regarded as a proof of the capabilities of this establishment to encounter and overcome any difficulties.

On the succeeding page will be found engravings from some few of the excellent Art-manufactures to be seen in this Court; two of these engravings, the JUG and the WINE-COOLER, are not new to our readers, but they are so beautiful, and attract so much attention in the Court, that we felt it would have been unjust to the producers to omit them on the present occasion. The TANKARD, the VASE, and the FLOWER-STAND, are among the more recent contributions; they manifest the taste and superiority

of design which have gained for the artists employed by Messrs. Elkington such well-deserved credit, as well as the care and the skill which are identified with the labours of those whose duty it is to carry out the intentions of the designer. The manufacturers are at present engaged upon a variety of new works of this description, some of which we

expect to be able to afford our readers an idea of by means of engravings now in preparation, and which we hope to introduce at an early period.

The "Iliad Salver," although it is the latest, and perhaps the best, of the numerous salvers produced by Messrs. Elkington, is certainly not the only work of the kind which will interest the visitor: there are many others in the Court that will well repay close inspection; so too will the large collection of shields, vases, dishes, candelabra, statuettes, and bronzes of infinite variety, and for useful and ornamental purposes. We would particularly direct attention to the bronze groups, illustrative of

"Warwickshire History." Since those now in the Crystal Palace were executed, others have been produced, as "Guy of Warwick and the Dm Cow," the

"Lady Godiva riding through Coventry;" these have not yet made their appearance at Sydenham, though we

presume they will do so in time. The "Lady Godiva" has just paid a visit to the King of Belgium, at Brus-

sels, who expressed a great desire to see her ladyship; it has, we hear, elicited the admiration of all who have seen it, especially of the gentlemen of the turf, who

pronounce it one of the most splendid prizes ever seen on a race-course; for, we should remark, it was executed for a prize, and was won recently by Lord Clifden. We presume it will be reproduced by the manufacturers.

Referring to the exhibition of the works of Messrs. Elkington in the corridor of the gallery, we must point out the collection of life-size statues—all, if not most of them, from the sculptures of British artists: here is MacDowell's "Day-dream," Dur-

ham's "Fate of Genius," Thomas's "Racket Player," the latter two exhibited in the Great Paris Exhibition; and others after Gibson, Weekes, Bell, Kirk, Chamberworth, &c. Perhaps nothing shows more the value of the electrotype process than these beautiful productions; year after year, since its introduction, have we seen it making sure and rapid progress,

beginning with ordinary objects of domestic use, till it has grappled with and overcome the greatest difficulties in its application to the highest embodiments of artistic conception; while the thoroughly

satisfactory result it has yielded has shown to the world that "Science has presented Art with an offspring of real genius, which has not only talent, but also courage and perseverance enough to fight

its own way." To Messrs. Elkington and Mason must be assigned a very large portion of the merit of electrotyping, and of the estimation in which works so executed are held all over the civilised world.

SUGGESTIONS OF SUBJECT TO THE STUDENT IN ART.*

BY AN OLD TRAVELLER.

CHAPTER IX.

Turin the Magnificent—Piazza Castello—Piazza Madama—Triptie of Martyrs—Catalan Girardet—Bartheleini Hector—Geoffry Varaille—The Pastor of Angrogna—Midnight—A scene on the Isère—Keep at home!—Selethrytha—War in the Olden Time—The Captive—A Student—Alfred in Council—The Gerefa Lueumon.

FEW cities present to the traveller a more cheerful aspect than is that first offered to his view by Turin; but how sorrowful are the recollections oppressing his heart as he traverses that fair metropolis of the Sardinian dominions! how gloomy are the pictures rising before him as he crosses the handsome squares of the city, or loiters beneath the long colonnades that surround the regal abodes of her kings!

Omitting all mention of matters purely political, we confine ourselves within the comparatively narrow limits of her ecclesiastical history, and even of that will touch only on the period when Francis I. of France was contending for supremacy in Piedmont with the Emperor Charles V.; yet see within how few months do we find the melancholy Triptie by whose lurid tints the heart is saddened, and all power of enjoyment suspended, as now we pace the superb length of the Piazza Castello, and cross that portion of the splendid square known in the present day as the Piazza Madama.

We are in the year 1535: the unhappy Waldenses—in our day, thanks to the improved spirit of the times and to their present sovereign, unhappy no more—have presented to Francis, then ruling them, their humble “entreaties for some liberty of conscience,” but he replies to the effect that he had not “burnt heretics by hundreds, in all parts of France, with intent to suffer a reserve of their pernicious hordes in the Alps.” Here, accordingly, stands Catalan Girardet, one of the first to whom Francis gave proof of his determination to endure no heretic in the lands under his rule: the pile of martyrdom awaits him; its ominous form is reared but a few short paces from the spot whereon we stand, in this proud and magnificent Piazza Castello. The noble sufferer is brought forth: he looks around on the assembled multitude, the congregated masses regarding him with mingled feelings of reverence and grief, or of contempt and exultation, as their modes of belief and the varieties of their character prompt them.

Passing between the martyr and the foremost ranks of the spectators is a labourer driving an ass, on whose back there are panniers filled with stones. From these Girardet has selected two; you perceive that he presses them between his hands: he is speaking, and these are the words he addresses to certain ecclesiastics standing prominently forward—men who were among the most active of his persecutors:—

“Ye think to destroy our churches by the might of your persecutions, but as soon shall my weak hands avail to crush these hard yielding stones.”†

Here, too, died Barthélemi Hector; his offence the dissemination of the Scriptures; his fate such as that of Girardet—his last words ascribing “glory to God, for that he was judged worthy to suffer death in so righteous a cause.”

The same beautiful site, but a somewhat later period, furnishes your third picture, and shall complete the sorrowful series, as presented by these shining haunts of the gay and fair,—although in truth they do but form a very small part of the dreary spectacles to which the pompous dwellings rising around us have borne witness. It is Geoffry Varaille who is now to suffer for the faith.

“The only son of a distinguished commander in the invading army of 1488,” says our author,‡ “himself the inmate of a royal palace—first an admired courtier, and subsequently placed high among the most favoured members of the Catholic hierarchy, he is yet content to become the humble pastor of the despised Waldenses.” And here, on the beautiful square before us, in this same Piazza

Castello, did he too seal his testimony with his life.

Unlike Girardet—whom we looked on ere yet the fetters had been placed around him—Geoffry Varaille is fastened to the stake. He does not regard the bystanders; “the deep mysterious joy,” declared by more than one eye-witness to have “irradiated his countenance” as he late addressed them, has given place to an expression of the tenderest pity: all his thoughts and care are at this moment devoted to the heart-broken creature whom you see beside him, the fatal cord falling from his nerveless grasp; to him “whose trembling hands,” to cite the same authority, “were on that day to perform strange offices.”*

For the hapless executioner is no other than the faithful servant of Varaille; one who has attended him from his childhood, and whose aged form shall be made to quiver beneath the scourge of the persecutor—as his pitying master but too well knows—when the cruel office here imposed on him shall have been performed.

Some influence, friendly to the martyr, or perchance the desire of his murderers to shorten his appeal to the multitude—thousands of whom bore subsequent testimony to his constancy—caused the severity of the sentence to be somewhat diminished in his case by strangulation, previous to the kindling of the flames. But by a refinement of cruelty, which makes the latter the more probable inference, and of which there is unhappily but too many instances in these annals, the attached servant of the martyr was the man doomed to effect this purpose. Furthermore, for he too has been found guilty of listening to the words of truth, the wages that await him are the loathsome dungeon, the scourge, the rack, and finally the branded brow, reducing him to a level with the convicted felon—for to all these has the unhappy trembler here before you been already condemned.

During the same sorrowful period, but not within the walls of this fair city of Turin, did the Vaudois pastor, Martin Gonin, assume that crown of martyrdom which his judges vainly exhorted him to forego: but the life they pressed on his acceptance must have been purchased by apostacy, and the noble confessor could not hesitate. Of him, too, we find mention in that history of the Waldenses so frequently cited, and it is in the following words that Miss Wiliams commences her narration of the facts relating to his death:—

“One of the most distinguished pastors of the poor scattered flock, Martin Gonin of Angrogna, was entrusted by his brethren with the conduct of certain ecclesiastical affairs, for the arrangement whereof he had repaired to Geneva: returning thence to the valleys, he was apprehended as a spy, but on examination was found innocent of the charge. His jailer searched him nevertheless, as he was about to leave the prison, when papers were discovered involving him in a charge still heavier. A spy might hope for mercy—a heretic never. The Vaudois pastor was tried a second time; he was condemned to death by drowning, the sentence to be carried into effect amid the silence and darkness of night, on the 25th of April, 1536. In pursuance of that decree the missionary’s burning light was quenched in the waves of the Isère.”

“There were circumstances of painful interest connected with this midnight murder,” says our author, in conclusion; “but we will not dwell on those protracted agonies. The cold river of death has long been passed, and angels have welcomed the pilgrim on the other bank, and introduced him to the company of the redeemed.”†

To the painter who may choose this melancholy episode of a dark history for his theme, the Isère here offers some of the most picturesque features of its course: the artist will remember that it is night, and the general heaven is even lowering in darkness, but between two clouds, which she has richly fringed with silver, there appears the cold bright moon. A radiant belt of light is thus thrown across the distant reaches of the river, while that portion of its waters soon to be desecrated by an act of cruel wrong and violence, lies lurid beneath the torches wherewith those darksome ministers of

an evil will—in whose impure hands the martyr lies bound—have sought to diminish the perils besetting the latter portion of their way. These flash on wild rocks of varied hues; they call forth strange effects from all the objects, animate or inanimate, immediately surrounding the scene of crime and suffering; the former, comprising the executioners, their victim, and attendants, with a group concealed from them, and visible to the spectator only. On more than one face among those surrounding the doomed man you read pity and compunction; a youth is even gazing into the darkness beside him, as with the lingering hope that rescue might yet be near. The martyr takes no part in these emotions; his fettered hands are clasped in prayer, but on his countenance is none of the agony of one who “wrestles with his God.” peace ineffable is beaming from that face of holy trust, and every beautiful feature—clearly revealed by the torches—is bright with that foretaste of heaven already vouchsafed to the servant of truth.

On the edge of the circle of light produced by the torches, and all but beyond their influence, three figures are concealed within the foliage; the depth of shadow prevents you from perceiving them until after close examination, but this given, you behold a woman on whose features there is the anguish of despair: she has fixed her dry and grief-hollowed eyes on the martyr, and your prayer for her is, that her soul—so manifestly wedded to his own—may be permitted to depart with it, and be at rest. Beside, or rather partially behind her, are two others, whose faces you do not see; but you discern the grey locks that shade the cheek of the one as she turns to support the sinking form of the other—a girl methinks, for her dark tresses, falling over the arm of her companion, can scarcely belong to aught but youth. The child perchance of the martyr! Almost is one tempted to echo the awful denunciation of that master in song, who, speaking of this hapless country somewhat more than a century later,—when the atrocities committed by the troops of Pianezza drew forth letters of remonstrance from Oliver Cromwell to its ruler, then Charles Emmanuel II., and to his wicked instigator, Louis XIV. of France,—burst forth in words that cannot be unknown to any one of you. I repeat them nevertheless, as does our author, from whose pages it is that I now take them,* the latter lines excepted, which are there omitted:—

“Avenge, O Lord, thy slaughtered saints, whose bones
Lie scattered on the Alpine mountains cold;
E’en them who kept thy truth so pure of old
When all our fathers worshipped stocks and stones,
Forget not: in thy book record their groans
Who were thy sheep, and in their ancient fold
Slain by the bloody Piedmontese, that rolled
Mother with infant down the rocks. Their moans
The vales redoubled to the hills, and they
To heaven. Their martyred blood and ashes sow
O’er all the Italian fields, where still doth sway
The triple-tyrant: that from thence may grow
A hundred fold, who, having learned thy way,
Early may fly the Babylonian woe.”

MILTON.

“South and north!” there is some one who is exclaiming; and he asks, “Have we nothing at home, that we should wander so far a-field?”

Quickly do we reply to the patriotic—or, if that he too sublime a word, to the jealous—querist, “We have, and in abundance.” What do you say, for example, to another survey of the quaint old chroniclers? or, to begin with the beginning, will you go first to that region of fable within whose shadowy precincts the earliest annalist of every land finds the more remote of his researches ever prone to land him? Here, to commence with, is a picture grouped for us in very far-gone days, and by actors who did certainly not calculate on having their proceedings depicted in these present times. It has never been painted; but so much the better, and your story will look all the fresher in the eyes of the beholder for that circumstance: the facts are these.

Towards the close of the sixth century, and no long time after the foundation of East-Anglia into a monarchy by Uffa, there lived a brave and powerful king of the Varni, to whose heir, called Radiger, was betrothed the East-Anglian princess, Selethrytha. But, subsequently preferring the alliance of Theodchert the Frank, whose sister was his own

wife, the king of the Varni compelled Prince Radiger to marry into the family of Thierri, King of Austrasia—now France—his betrothal to the lady of our land notwithstanding.

But the two Varnian chiefs had neglected to ask the consent of one person, whose goodwill was yet found to be essential to the peaceful conclusion of the business—this was no other than the East-Anglian princess herself; and our gentle Seletthytha—whose name, as the learned tell us, signifies nothing less than “an earnest threatener”—no sooner became aware of that oversight, than she resolved to make all parties repent of their omission: to that end she gave herself no repose until she had stirred up her countrymen to fall upon the people of the Varni with fire and sword.

But now, lest your displeasure with this lady, who so well knew how to assert her own rights, should influence you to the degree of rejecting her, as Prince Radiger did, I must remind you that the indignity she had suffered was then held to deprive the party enduring it of reputation; and the injured princess had no longer the right to hold up her head among the noble virgins and matronage of her nation, as one equally honourable with themselves. Your recollection of this will serve in some measure to excuse her in your eyes, as it did in those of her people, by whom it was considered so complete a justification, that they embarked heart and soul in her cause.

To no leader less profoundly interested than herself would the offended lady entrust the duty of avenging her. It is true that the fleet, in the foremost of whose galleys she sailed, was commanded by her brother, whom she commissioned to bring the principal culprit to her feet; but it was to herself that she reserved the right of inflicting the death she had already awarded to his crime.

Many battles ensued, but these I do not describe, although none who love such theme is forbidden to paint them: let it now suffice to say that our islanders were victorious; they cut all opposing them to pieces in the most approved method of the time, and returned to their lady with songs of triumph.

But the trophies laid before her were rejected with disdain; Seletthytha drove her defenders from her presence with reproaches that did honour to her name: they had done nothing, the offending Radiger was still at large, and until they had given him bound and helpless to her hand, let them look for little credit for their work.

Again the furious tribes of Suffolk and Norfolk were poured, a fiery stream, upon the shores of the Rhine; and when all had been rendered desolate to the gentle lady's fullest content, her enemy was himself found to be among her captives.

And now begins your work—if you have not already commenced it at some moment more congenial; and in that case now *proceeds* your pleasing toil, for you can scarcely refuse to paint me the scene we have before us.

She stands proudly within her tent—the beautiful rejected; the lofty stature she derives from her large-limbed race not surpassing the limits proper to the perfection of womanly beauty, and the whole figure utterly faultless in its richly-developed proportions. One finely moulded arm is raised with a most graceful action; the firm full hand—not hard of outline, or masculine in its character, as might have been, had Seletthytha given evidence of cruelty in any cause less sacred than the defence of her honour—but most feminine in its soft flexible form, and of colour and texture such as ivory might exhibit, were the spirit of a blush-rose breathing through its veins: this irreproachable hand, I say, is lifting aside the heavy clusters of her hair—a sunny brown—and gives to view a clear candid brow, beneath which there beam two lustrous eyes, well opened, beautifully formed, and now fixed with unflinching steadfastness of gaze on the features of the doomed Radiger.

He, too, is of noble port and lordly presence; he stands before her with a glance direct and fearless as her own. The axes of her people are uplifted for his death; they glitter coldly, they quiver in the hands that unwillingly restrain them, impatient of delay. Did he now seek her pardon, did he bend beneath the haughty looks that question his own, did he move so much as an eyebrow as the menacing weapons rise bright around him, she would doubt-

less give the signal for them to fall, and the days of Radiger would find their end. But the proud, firm gaze she bends on him is met by one yet firmer: nay, after looking for some few seconds at the handsome face before him, the captive prince, mindful of the gleaming axes, begins to change the look of bold defiance with which he had first sought the eyes of his enemy, for one of frank admiration and delight; he has forgotten all but the radiant loveliness of that bright vision, and the captor, fairly baffled, feels a blush threatening to steal over the whiteness of her brow: this time not entirely of anger.

Conscious then, perchance, to that approach of manifest defeat—for her terrors have clearly failed to make her enemy quail—perchance, too, remembering that the offensive marriage of Radiger had been forced upon him for purposes purely political, and was not of his own seeking, the lady closes her scrutiny by waving a sign to her warriors, who draw back to the utmost limits of the pavilion, and she is at liberty to confer with her captive.

The words of their dialogue I am not prepared to repeat, but the result of it was, that the sister of Theodebert was sent back to Austrasia, and the East-Anglian princess, returning as the wife of her sometime foe, considered herself to have worthily vindicated her name from the reproach that might have fallen upon it, and felt that she might henceforth hold her head well up among the noblest matrons of her country.*

And now, may not the semblance of this handsome pair and their surroundings help to make us a picture worthy of its place in some fair gallery? You will treat the subject in such sort as shall ensure it welcome in the highest—there can be no doubt of that. For the eyes of our Seletthytha, what is their colour?—through those long silky lashes, and in certain lights, they look almost black, yet black they are not—“over-gods forbode!” they are not even grey, although they might be such with less to startle one's sense of the right and fitting; and the rather as grey eyes, supposing them of the right colour and quality, have also that property of looking black which some admire; but oh! better than all blackness—unless it be that of the large eastern eye, which, by the way, is *not* black—is *your* colour, ye thoughtful and earnest eyes of grey. But Seletthytha's eyes are not grey, they are blue, and if they have not that rare and priceless tinge of the violet which proves that love, deep as the love of seraphs, is in the nature of the possessor, and quickening every pulse of the true and steadfast heart below them, yet neither are they of that cold, glittering, snake-like hue sometimes called blue, but chiefly for lack of some more closely descriptive name for the colour, or rather no-colour, in whose steely paleness you see nought better than the concentration of self-worship. No; give my proud, resentful, nay, fierce, if it must be so, and cruel princess, no eye such as these; her orbs are blue, full-tinted, and, if without that hue of heaven aforesaid, the ever-blessed violet, that is because the distinction thereof is vouchsafed to few in the world we breathe in. Many shall wear it in a better region—'tis the faith we hold to; but here below, if you see it more than twice in a life-time, believe that you are favoured beyond your fellows. A good, bright, generous tone of blue then are the eyes for my Seletthytha's wear, and here enough; the rest I leave to your excellent good judgment and never-to-be-questioned taste.

In the same work, and with relation to the most admired of our early sovereigns, I find an incident of later period, described by the friend and biographer of Alfred—the churchman Asser, namely—which has also a certain interest, as marking the habits of a man respecting whom we could scarcely know too much or see too many delineations in our galleries. The words, as altered somewhat for my present purpose, are these:—

“Passing over the time, “when a young man, and of a youthful mind,” as we learn from the reluctant

admissions of his attached biographer, he would not hear the oppressed when they came to him, but treated the poor “as of no estimation,” and when his kinsman St. Neot admonishes the king with all faithfulness, exhorting him to “cease from wandering in depraved manners,” his sins “with alms to redeem, and with tears to abolish;” when the same unflinching monitor adds, “depart entirely from thine unrighteousness, or much shalt thou suffer in this life, and surely shalt thou be deprived of the kingdom thou art misruling.” Passing this, nor yet lingering on that fulfilment of some portion thereof to be found in the sufferings endured from “that swain's evil wife, whom he feared because she would scold,” as the same writers tell us, and the story of whose burnt bread is so well known, let us come to the time when, all youthful errors abjured, Alfred had won for himself the titles of “the just,” “the wise,” and “the truth-teller,” even from those severe judges and true friends, of whose rectitude in his behalf you have proof above.

Many works of great importance to the future advancement and culture of his people have now proceeded from the pen of the learned monarch—singularly learned for his day, and it is as a student that I want you to set him before us. Thus it is that we have him. The time is a wild night in autumn of the year 893; the wind whistles fitfully through the many crevices of the royal abode and its ill-fitting doors and windows; the latter, but recently furnished with the luxury of horn panes, shake and rattle as the blast raves around them. The noble-looking occupant of the rude chamber suffers little interruption from this circumstance, but sometimes, as a gust of more than common violence comes raving through the building, his head, previously bent over his employment, is slightly raised, and a glance of satisfaction is given to the tall waxen tapers that supply him with light; these, steadily burning in the clear horn casings, which he had himself contrived for them, bid calm and successful defiance to the airs that, blowing unheeded around the head of the observer, were seen with pleasure to assail as vainly the good shelter he had invented for his light.

At once a lamp and a timepiece, the slender shaft now permits one of the small metal globes, attached to its length at equal distance, to drop with ringing sound into the brazen bowl prepared for its reception, thus giving King Alfred to know that the short time which alone his many avocations permitted him to bestow on the object then filling his thoughts was expended; and rising from a board whereon he had been tracing certain lines, segments of circles, &c., the foreshadowings of improvement contemplated in the naval architecture of the period, the earnest student lays his rough pencil aside.

He now gives the signal that an official, appointed for that hour, and who, as he doubted not, was waiting without, might enter his presence, when the Gerefa Lueumon—punctual, as is ever the servant of a master exact in the measurement of his own time—stands instantly before his lord.

But the marks of heavy care are on his brow, and his compressed lips are eloquent of something much amiss, although as yet no sound escapes them.

“Then it is true that the restless Hæsten hath left his lair on the Norman coast, and it is indeed to our own shores that the Sea-king shapes his course?” observes King Alfred, the face of the Gerefa* being a sufficiently speaking exponent of the information his master had sent him to gather, in consequence of rumours lately brought him.

“It is even so, noble king,” replies Lueumon; “his ships are off the Kentish coast; already has he destroyed the forts constructing by your orders in the fens, and his barbarian hordes have well-nigh completed a strong line of defence along the Rother.”

“He is a noble leader,” rejoins the generous Alfred, “and must be worthily met. Behold! Sigeric and Ethelwyn come to share our council,” he adds, as the thranes he mentions are seen entering the chamber. “Summon our trusted Ccolwulph,

* The facts of this legend are taken from the Greek historian Procopius, an author not known to the present writer, by Mr. Sharon Turner, from whose “*History of the Anglo-Saxons*,” and from Gibbon's “*Decline and Fall of the Roman Empire*,” it was taken some years since for a work then published; it is from the last-mentioned publication, “*Stories and Studies from Chronicle and History*,” namely, that the above has now been, not extracted, but adapted to the writer's present purpose.

* Gerefa: the officer bearing this name, from which it seems probable that we derive our modern “sheriff,” was one of much consequence in the executive; but his duties were of a character so widely varied that we know of no office now existing that could be called strictly equivalent. There were three classes of gerefa. See “*Stories and Studies from Chronicle and History*,” vol. i. p. 124, et seq.

with the Bretwalda* Ethelbald; let our honoured kinsman Neot also know that we crave his presence; pray our good Asser to accompany him, and return thyself to take part in this matter."

"But see thou bring more cheerful looks with thee," continued the speaker, with a friendly smile; "thy wisdom hath aided me through as dangerous a juncture: redoubted as this Hæsten is, fear not, my good Læumon, thou shalt see me well through this, our best efforts, and the blessing of Heaven upon them to aid."

That the confidence thus expressed was well-founded, you will all remember, a series of victories followed; the wife and family of Hæsten, twice brought as prisoners to the presence of Alfred, were twice returned, with costly presents, to their natural protector, the beaten and baffled Sea-king; and the Danes, with their allies, the Frisians, were ultimately driven from the land.

Take now either or all of the scenes suggested by these events, unless you prefer the din of battle rather, and in that case you may depict the death of the Gerefæ Læumon, who fell, to the lasting grief of Alfred, in the last battle fought on this occasion.

The fearful ravages to which the country had been exposed were followed by a pestilence that for three years "filled the nation with the bitter death of straw,"† offering but too many occasions for the exercise of those virtues which placed Alfred high among the greatest, if they did not render him the very greatest sovereign the world has ever produced.

THE BRITISH ASSOCIATION IN ITS RELATIONS TO ART.

THE twenty-sixth meeting of the English Parliament of Science has recently been held at Cheltenham, under the presidency of Dr. Danbeny. A careful review of the proceedings has convinced us—notwithstanding the cry which we have heard, that science shows no signs of progress—that a healthful vitality stirs the body of philosophers; and plodding industry is displayed on every hand, gradually developing those beautiful truths, by the accumulation of which man advances to a knowledge of nature's grandest laws.

The *Art-Journal* is not the place in which to discuss the numerous matters brought before the respective sections; yet a brief notice of the general bearings of the questions brought under consideration, showing their practical value, and a more especial comment on those points which have any relation to Art, cannot fail to interest its readers.

In the address of the president many most important advances in chemical and botanical science are fully explained. As botanist and chemist, Professor Danbeny has wisely chosen to dwell more fully on his own departments of science, rather than to wander into those domains of physical investigation with which he cannot claim such intimate acquaintance. The rapid progress made in organic chemistry was clearly shown; the useful products which it has already given us explained; and the probable results of the inquiries, which are pushed forward with much energy, detailed with much exactness.

When the British Association commenced its useful labours, all—of chemistry—that could be quoted as worthy the name of a science was comprehended within the limits of the mineral kingdom. "Here, at least," continues the president, "the outline had been traced out with sufficient precision; the general laws

established on a firm basis; the nomenclature framed with logical exactness; the facts consistent with each other, and presented in a scientific and luminous form. Thus, a philosopher, like Sir Humphrey Davy, who had contributed in so eminent a degree to bring the science into this satisfactory condition, might, at the close of his career, have despaired of adding anything worthy of his name to the domain of chemistry, and sighed for other worlds to subdue. But there was a world almost as little known to the chemists of that period as was the western hemisphere to the Macedonian conqueror,—a world comprising an infinite variety of important products, called into existence by the mysterious operation of the vital principle, and therefore placed, as was imagined, almost beyond the reach of experimental research. This is the new world of chemistry, which the continental philosophers, in the first instance, and subsequently those of our own country, have, during the last twenty years, been busy in exploring; and, by so doing, have not only bridged over the gulf which had before separated, by an impassable barrier, the kingdoms of inorganic and of organic nature, but, also, have added provinces as extensive and as fertile as those we were in possession of before, to the patrimony of science."

Many of the discoveries in organic chemistry will at once occur to all. The production of fruit essences, for example, from the waste matters of cities, and of the perfumes of flowers from the refuse of manufactories, are now well known; our fancy soaps and cheap confectionery deriving their odour and their flavour from these sources. From the putrifying heaps of the dye-works, a colour rivaling in brilliancy the original madder reds is now extracted; and we may reasonably hope within a very short period to be enabled to reproduce in our laboratories all those useful products which have hitherto been obtained only direct from natural sources. In discoursing on these advances of chemistry, Dr. Danbeny says, "Already, indeed, chemistry has given tokens of her powers, by threatening to alter the course of commerce. Thus, she has discovered, it is said, a substitute for the cochineal insect in a beautiful dye producible from guano. She has shown that our supply of food might be obtained at a cheaper rate from the antipodes, by simply boiling down the juices of the flesh of cattle, now wasted and thrown aside in these countries, and importing the extract in a state of concentration. She has pointed out that one of the earths which constitute the principal material of our globe, contains a metal as light as glass, as malleable and as ductile as copper, and as little liable to rust as silver; thus possessing properties so valuable, that when means have been found of separating it economically from its ore, it will be capable of superseding the metals in common use, and thus of rendering metallurgy an employment, not of certain districts only, but of every part of the earth to which science and civilisation have penetrated."

The beauty of the lakes and earmines rendered them especially valuable to the artist. It has ever been a matter of regret that such pigments should not possess the desired degree of permanence. It is said that the colour obtained from the guano has the valued persistence, and that, as far as experiment has been able to determine the problem, its resistance of atmospheric and luminous influences is great. The metal aluminium promises to be available for many purposes in the Arts. At present, owing to its high price, this beautiful metal has only been employed in the manufacture of watch wheels, by a maker in Paris, in the formation of small weights (for this purpose its lightness renders it exceedingly valuable), and for coating some of the more delicate philoso-

phical instruments. Aluminium is now nearly the price of gold. This arises from the cost of production, the process being, in brief, as follows:—From pure clay—such as the finest porcelain clay—a chloride of alumina, is formed; this is exposed to heat, in a closed vessel, in contact with sodium; by this the aluminium is liberated and distilled over. Sodium is, it is well known, obtained from commercial soda; and as the production of aluminium depends upon the cost of sodium, it cannot but be interesting to know that this singular metal is said to be obtained by a chemist of Glasgow at five shillings the pound, and that it is expected that it may be manufactured at even less than this. When this manufacture comes fairly into operation we may expect to obtain aluminium at less cost than silver; and endless are the Art-applications of this metal, which exists in every variety of clay spread over the surface of our globe.

The Stereoscope has largely engaged our attention; there are, however, some curious points connected with the instrument, and bearing on the phenomena of vision, which are not satisfactorily explained. Mr. Claudet brought before the physical section some remarks on the refraction which occurs in semi-lenses, tending to explain the cause of the illusion of curvature given to pictures representing flat surfaces. It was shown that all vertical lines, seen through prisms or half-lenses—which are virtually the same in physical character—are bent, presenting their concave side to the thin edge of the prism, and, as the two photographic pictures are bent in the same manner, the inevitable result of their coalescence, in the stereoscope, is a concave surface. It is proposed to obviate this; and the suggestion is deserving of every attention by those in possession of these pleasing instruments. By employing the centre of the lenses *only* to examine the two pictures, the defect is overcome. The centre of the lenses do not, however, refract laterally the two images, consequently their coincidence cannot take place without placing the optical axes in such a position that they are nearly parallel, as if we were looking at some very distant object—such as the moon. By practice, there are but few persons who could not use such a stereoscope. Mr. Claudet, by a simple experiment, illustrates the above conditions. If, holding in each hand a prism, a person looks through their thin edges at the window from the opposite side of the room, he will see, first, two windows, with their vertical lines bent in contrary directions; but by inclining gradually the optical axes, we can converge them until the two images coalesce, and we see only one window; as soon as they coincide the lateral curvature of the vertical lines ceases, and they are bent projectively front back to front: we have, then, the illusion of a window concave towards the room, such as it would appear reflected by a concave mirror.

A process for introducing clouds and artistic effects into photographs engaged the attention of the physical section. The pictures produced were very pleasing; but it must not be forgotten that they were printed from a *negative*, which had been so far tampered with as to lose all its photographic character. The gentleman communicating this subject, Mr. E. Vivian, speaks of enabling the photographer to *compose* pictures in accordance with the rules of Art, without the least sacrifice of detail, or departure from the truth of the original negative, *so far as the latter is true to nature*. Nothing can possibly be more dangerous to photography or more detrimental to Art than this. The truth of the solar picture is to be sacrificed to the fancy of the artist; and the work of Art is to be degraded to the mechanical process of "supplying the deficiency of the yellow ray, modifying the excessive action of

* The Bretwalda was a leader of high command, whether in peace or war.

† Among the fierce Northmen of those days all who did not die in battle were said to "die a straw death," the expression, if uttered in scorn, not unfrequently procuring for either the offending utterer, or the affronted listener—nay, sometimes perhaps for both—an exemption from the disgrace and bitterness thereof, by the more violent and more congenial mode of ending life consequent on the quarrel thus occasioned.

the blue, toning down its glare, and mending the *unnatural* whiteness of slate roofs and water."

Photography has its proper field; and within its legitimate limits there are few applications of science which take a wider range or produce more beautiful effects. The defects of a photograph are well known; but these are compensated by that truthfulness of detail now so reliable. We value a photographic picture of the Temple of Minerva for that fidelity which the human hand cannot attain to; we treasure a "sun-picture" of Thermopylae, or of the plain of Marathon, not as we would treasure a Turner-esque picture of these hallowed spots, but for the *mechanical* truth which gives us the minutest objects on the scene. The lover of photography desires no artistic effects beyond those which he can obtain by a careful study of nature, and close observation of those physical conditions which exist in the marvellous sun-beam. If once the photographer is permitted to *paint* in shadows, and *rub* out lights, we may have pretty positive pictures, but all the interest of the art is gone.

To Art, photography is a dangerous hand-maid; the true artist may use photography as a study of nature's grouping and detail; but if he goes beyond this the result is injurious. In the Exhibitions of the Royal Academy, and of Water-Colour paintings, there have been too many evidences of the uses made of photography. Much of the minute and often admired detail seen in the foregrounds of the landscape-painter—the reedy pool and the ferny combe—are too evidently the produce of the camera-obscura. Minuteness has been gained in the pictures—mind has been lost.

Mr. Nasmyth made some observations on the form usually attributed to lightning by painters in works of Art, both ancient and modern. He said the differences which he had observed between the electric flash of the artist and the same phenomena in nature were very considerable. He believed the error to originate in the form given to the thunderbolt in the hands of Jove, as sculptured by the Greeks. The form of lightning, as exhibited in nature, was simply an irregular curved line, shooting from the earth below to the cloud above, and often continued from the cloud downwards again to another distant part of the earth. This appearance was conceived to be the result of the rapidly shooting point of light, which constituted the true lightning, leaving on the eye the impression of the path it traced. In very intense lightning offshoots of an arborescent form may be observed to proceed at several places from the primary track of the flash. There are many of these great natural phenomena to which it is extremely desirable that the attention of the landscape-painter should be directed.

Mr. H. R. Twining exhibited models to illustrate a new method of teaching perspective. The advantages of a knowledge of the principles of perspective to every one—even those learning to draw—are too obvious to be insisted on. Mr. Twining's principle has many points of great merit. He arranges his solid forms in an agreeable manner; and places an image in the exact spot which the observer ought to occupy, and which serves to mark the true focus of the picture. Thus is obtained a combination by which perspective principles can be studied in all their detail.

In connection with the phenomena of colour there were several communications. Dichromatic phenomena are scarcely known to artists; yet they are constantly occurring in nature, and are frequently observable in the productions of Art and manufacture. The German poet and philosopher, Goethe, has, with his usual perception, dealt with this somewhat complicated subject. The chapter on these phenomena, in Eastlake's translation of Goethe's

"Theory of Colours," deserves close attention. There was one communication by Dr. Gladstone on some dichromatic phenomena among solutions, and the means of representing them, which detailed many remarkable facts as to the power possessed by fluids under different chemical conditions of transmitting some rays and reflecting others.

The theory of compound colours, with especial reference to mixtures of blue and yellow light, was the subject of a communication from Mr. J. C. Maxwell. The principal point of the paper was to prove that, although mixtures of blue and yellow pigments made green, that the green ray of the spectrum was not—as is frequently stated—the result of a combination of the blue and yellow rays. Plateau, J. D. Forbes, and Helmholtz, have severally drawn attention to the fact that when we whirl a disc upon which the two colours blue and yellow are painted, the result is not a green, but a neutral grey. Mr. Maxwell had another paper, "On the unequal sensibility of the *foramen centrale* to light of different colours." This paper can scarcely be said to have any artistic bearing; but as explaining the want of sensibility in some eyes to colours of a particular order, it was of interest.

The communication of the session—regarded as to its scientific value and practical application—was that of Mr. Bessemer on his new method of manufacturing iron, by which all the laborious operations of the puddling furnace are avoided. The importance of this metal—iron—to this country, entering as it does into every branch of our manufactures, renders any discovery by which it can be produced in a purer state, at a much cheaper rate than ordinary, of the first moment. Although Great Britain possesses an abundant supply of iron ores of various kinds, and an almost unlimited supply of fuel, yet the British iron has only in a few instances proved equal to the iron of Sweden and of Russia. The superiority of these foreign irons has been thought to be due to the charcoal fuel employed; and the charcoal iron of the Ulverstone furnaces has been considered equal to the Swedish. It would appear, however, that by the process of Mr. Bessemer, any of our irons can be rendered—either as steel iron or as bar iron—quite equal to that obtained from the Continent.

Our iron manufactures may one day form the subject of an article for this Journal; at present we have only to state that the process of Mr. Bessemer—which has created much sensation in the iron trade—consists in forcing air through molten iron immediately after it is drawn from the blast furnace. The operation of this is remarkable. The oxygen of the air, combining with the carbon which is always mixed with pig-iron, increases the combustion, and consequently the fluidity of the whole mass. Under the operation the fluid iron boils violently, and all the impurities which tend to the deterioration of the metal are thrown up to the surface in an oxidised state, or ejected as carbonic acid. It is said that in a short time steel of fine quality is obtained; and by continuing the process a little longer, refined iron of the purest nature.

Ornamental castings in iron, equal to those of Berlin, may now be easily produced in this country; and where we have hitherto been compelled to employ iron of inferior quality, we may now use steel, or *l'etal* of the most superior malleability. If the process of Mr. Bessemer—when tried on an extended scale—equals the experimental results obtained, this discovery will be one of the most valuable ever made in this important branch of human industry.

THE ROYAL PICTURES.

THE MADONNA.

Carlo Dolci, Painter.

F. Bal, Engraver.

Size of the Picture, 10 in. by 8½ in.

CARLO DOLCI, as we learn from his friend and biographer, Baldinucci, was of a Florentine family, of whom his father Andrew, and his grandfather and uncle by his mother's side, Pietro and Bartolomeo Minari, were all painters, much esteemed in their native city. Carlo was born in Florence in 1616, and died there in 1686. At the age of four years he had the misfortune to lose his father, and his mother having a numerous family to support, placed him, when he was only nine years old, with Jacopo Vignali, who had studied in the school of Roselli, and acquired great reputation as a teacher. In four years, it is stated, he could paint so well that he attracted the attention of a distinguished amateur, Pietro de Medici, who introduced him to the court of Florence, where he found constant and profitable employment. About the year 1670 he was invited to Innspruck, to paint the portrait of Claudia, daughter of Ferdinand of Austria. On his return he became subject to attacks of melancholy, which continued at intervals till his death. He left behind him one son, who entered into holy orders, and seven daughters, one of whom, Agnes, painted in the style of her father.

Carlo Dolci, from the first, determined to paint none but sacred subjects. Baldinucci attributes his excellence to a special gift from heaven as the reward of his pious intentions. His pencil was, accordingly, employed chiefly on ideal portraits of the Madonna, Magdalens, and saints: they are characterised by pleasing and gentle expression, peculiar gracefulness, and a delicacy of execution which, for oil-painting, is carried to excess—the high finish and the texture of his pictures frequently giving to them a cold and artificial appearance. It is these qualities of refinement and finish that make his works so popular in Italy, where they have always been in great request among the wealthy religionists as ornaments and objects of veneration in their private apartments. His pictures of this class, for which he was usually paid about 100 crowns, are extremely numerous, for he painted many duplicates, and all now realise very high prices; but copies also abound, which were principally made by his daughter Agnes and his pupils, Alessandro Lomi and Bartolomeo Mancini.

His principal pictures, of a class that scarcely belongs to portraiture, are—"Madonna and Child," and "St. Andrew praying at the Cross," both in the Pitti Palace, at Florence; "Christ breaking Bread," "St. Cecilia," and "Herodias," in the Royal Gallery of Dresden; "St. John the Evangelist," in the Berlin Museum; and the "Daughter of Herodias with the Head of John the Baptist," in Windsor Castle. The Earl of Ashburnham possesses a duplicate of the "St. Andrew," and the Marquis of Westminster one of the "Herodias," in the Dresden Gallery. Dr. Waagen asserts that the Marquis purchased his picture from Lord Ashburnham. The same authority gives a list of twenty-eight pictures by Carlo Dolci in this country; the chief of which are—the "Virgin and Child," belonging to Mr. Wombwell; the "Nativity," and "Christ taking the Cross from Joseph," in the possession of Lord Cowper; the "Virgin and Child, with Saints," in Lord Ward's collection; the "Adoration of the Kings," at Blenheim, and the glorious half-length of the "Virgin with a Crown of Stars"—perhaps the finest example of the master in existence—in the same gallery; "Christ and the Woman of Samaria," in Mr. Harford's collection; a repetition of the Dresden picture, "Christ blessing the Bread," belonging to the Marquis of Exeter; another *replica* of the same work, in the possession of Mr. Methuen, of Corsham; and the "Marriage of St. Catherine," belonging to Earl Spencer.

The "Madonna" here engraved is in the collection at Windsor Castle: it is one of the many pictures of the same subject, and similarly treated, that exist in England and elsewhere; they are all easily recognised by the blue mantle covering the head. The Windsor picture is painted on copper.

F. BAI, SCULPT

THE MADONNA

FROM THE HISTORY OF THE ROMAN COLLECTION

LONDON: SCULPTOR, FOR THE YEAR 1811

THE MONKS OF THE MIDDLE AGES.*

BY THE REV. EDWARD L. CUTTS, B.A.

WE have already sketched the history of the rise of monachism in the fourth century out of the groups of Egyptian eremites, and the rapid spread of the institution, under the rule of Basil, over Christendom; the adoption in the west of the new rule of Benedict in the sixth century; the rise of the reformed orders of Benedictines in the tenth and eleventh centuries; and the institution in the eleventh and twelfth centuries of a new group of orders under the milder discipline of the Augustinian rule. We come now to a class of monastics who are included under the Augustinian rule, since that rule formed the basis of their discipline, but whose striking features of difference from all other religious orders entitle them to be reckoned as a distinct class, under the designation of the Military Orders. When the history of the mendicant orders which arose in the thirteenth century has been read, it will be seen that these military orders had anticipated the active religious spirit which formed the characteristic of the friars, as opposed to the contemplative religious spirit of the monks. But that which peculiarly characterises the military orders, is their adoption of the chivalrous crusading spirit of the age in which they arose: they were half friars, half crusaders.

The order of the KNIGHTS OF THE TEMPLE was founded at Jerusalem in 1118 A.D., during the interval between the first and second crusade, and in the reign of Baldwin I. Hugh de Payens, and eight other brave knights, in the presence of the king and his barons, and in the hands of the Patriarch, bound themselves into a fraternity which embraced the fundamental monastic vows of obedience, poverty, and chastity; and, in addition, as the special object of the fraternity, they undertook the task of escorting the companies of pilgrims from the coast up to Jerusalem, and thence on the usual tour to the Holy Places; for the open country was perpetually exposed to the incursions of irregular bands of Saracen and Turkish horsemen, and death or slavery was the fate which awaited any caravan of helpless pilgrims whom the infidel desecrated as they swept over the plains, or whom they could waylay in the mountain passes. And, besides, the new knights undertook to wage a continual war in defence of the Cross against the infidel. The canons of the Temple at Jerusalem gave the new fraternity a piece of ground adjoining the Temple for the site of their home, and hence they took their name of Knights of the Temple; and they gradually acquired dependent houses, which were in fact strong castles, whose ruins may still be seen in many a strong place in Palestine. Ten years after, when Baldwin II. sent envoys to Europe to implore the aid of the Christian powers in support of his kingdom against the Saracens, Hugh de Payens was sent as one of the envoys. His order received the approval of the Council of Troyes, and of Pope Eugene III., and the patronage of St. Bernard, the great preacher of the second crusade; and when Hugh de Payens returned to Palestine, he was at the head of three hundred knights of the noblest houses of Europe, who had become members of the order. Endowments, too, for their support flowed in abundantly; and gradually the order established dependent houses on its estates in nearly every country of Europe. The order was introduced into England in the reign of King Stephen; at first its chief house, "the Temple,"† was on the south side of Holborn, London, near Southampton Buildings; afterwards it was removed to Fleet Street, where the establishment still remains, long since converted to other uses; but the original church, with its round nave, after the form of the Church of the Holy Sepulchre at Jerusalem, still continues a monument of the wealth and grandeur of the ancient knights. They had only five other houses in England, which were called Preceptories, and were dependent upon the Temple in London.

The knights wore the usual armour of the period;

but while other knights wore the flowing surcoat of the twelfth or thirteenth centuries, or the tight-fitting jupon of the fourteenth, or the tabard of the fifteenth, of any colour which pleased their taste, and often embroidered with their armorial bearings, the knights of the Temple were distinguished by wearing this portion of their equipment of white, with a red cross over the breast; and over all a long flowing white mantle, with a red cross on the shoulder; they also wore the monastic tonsure. Their banner was of a black and white striped cloth, called *beauseant*, which word they adopted as a war-cry. The rule allowed three horses and a servant to each knight. Married knights were admitted, but there were no sisters of the order. The order was suppressed with circumstances of gross injustice and cruelty in the fourteenth century. The knight here given, from Hollar's plate, is a prior of the order, in armour of the thirteenth century, and the bulk of their estates was given to the Hospitallers.

A KNIGHT TEMPLAR.

The KNIGHTS OF ST. JOHN OF JERUSALEM, or the Knights Hospitallers, originally were a purely religious order, founded about 1092 by the merchants of Amalfi, in Italy, for the purpose of affording hospitality to pilgrims in the Holy Land. Their chief house, which was called the Hospital, was situated at Jerusalem, over against the Church of the Holy Sepulchre; and they had dependent hospitals in other places in the Holy Land, which were frequented by the pilgrims. Their kindness to the sick and wounded soldiers of the first crusade made them popular, and several of the crusading princes endowed them with estates; while many of the crusaders, instead of returning home, laid down their arms, and joined the brotherhood of the Hospital. During this period of their history their habit was a plain black robe, with a linen cross upon the left breast.

At length their endowments having become greater than the needs of their hospitals required, and incited by the example of the Templars, a little before established, Raymond de Puy, the then master of the hospital, offered to King Baldwin II, to reconstruct the order on the model of the Templars. From this time the two military orders formed a powerful standing army for the defence of the kingdom of Jerusalem.

When Palestine was finally lost to the Christians, the Knights of St. John passed into the Isle of Cyprus, afterwards to the Isle of Rhodes, and, finally, to the Isle of Malta, maintaining a constant warfare against the infidel, and doing good service in checking the westward progress of the Mohammedan arms. They are not even now extinct. The order was first introduced into England in the reign of Henry I., at Clerkenwell; which continued the principal house of the order in England, and was styled the Hospital. The Hospitallers had also dependent houses, called Commanderies, on many of their English estates, to the number of fifty-three in all. There were many sisters of the

order, but only one house of them in England. The superior of the order in England sat in Parliament, and was accounted the first lay baron. When on military duty the knights wore the ordinary armour of the period, with a red surcoat marked with a white cross on the breast, and a red mantle with a white cross on the shoulder. Their churches in England seem to have had circular naves, like those of the Templars; out of the four "round churches," which are all popularly attributed to the Templars, three really belonged to the Knights of the Hospital. The Hospitaller here given, from Hollar's plate, is a (not very good) representation of one in the armour of the early part of the fourteenth century, with the usual knight's *chapeau*, instead of the mail hood or the basinet, on his head.

A KNIGHT HOSPITALLER.

Other military orders, which never extended to England, were the order of TEUTONIC KNIGHTS, a fraternity similar to that of the Templars, but consisting entirely of Germans; and the order of OUR LADY OF MERCY, a Spanish knightly order in imitation of that of the Trinitarians.

Before turning from the monks to the friars, we must devote a brief sentence to the ALIEN PRIORIES. These were cells of foreign abbeys, founded upon estates which English proprietors had given to the foreign houses. After the expenses of the establishment had been defrayed, the surplus revenue, or a fixed sum in lieu of it, was remitted to the parent house abroad. There were over one hundred and twenty of them. Edward I., on the breaking out of war with France, seized upon them, in 1285, as belonging to the enemy. Edward II. appears to have pursued the same course; and, again, Edward III., in 1337. Henry IV. only reserved to himself, in time of war, what these houses had been accustomed to pay to the foreign abbeys in time of peace. But at length they were all dissolved by act of Parliament in the second year of Henry V., and their possessions were devoted for the most part to religious and charitable uses.

We have seen how for three centuries, from the beginning of the tenth to the end of the twelfth, a series of religious orders arose, each aiming at a more successful reproduction of the monastic ideal. The thirteenth century saw the rise of a new class of religious orders, actuated by a different principle from that of monachism. The principle of monachism, we have said, was seclusion from mankind, and abstraction from worldly affairs, for the sake of religious contemplation. To this end monasteries were founded in the wilds, far from the abodes of men; and he who least often suffered his feet or his thoughts to wander beyond the cloister was so far the best monk. The new principle which actuated the friars was that of devotion to the performance of active religious duties among mankind. Their houses were built in or near the great towns; and to the majority of the brethren the houses of the order were mere temporary resting-places, from which they issued to

* Continued from p. 287.

† All its houses were called Temples, as all the Carthusian houses were called Chartereux (corrupted in England into Charterhouse).

make their journeys through town and country, preaching in the parish churches, or from the steps of the market-crosses, carrying their ministrations to every castle and every cottage. They were, in fact, home missionaries; and the zeal and earnestness of their early efforts, falling upon times when such an agency was greatly needed, produced very striking results. "Till the days of Martin Luther," says Sir James Stephen, "the church had never seen so great and effectual a reform as theirs Nothing in the histories of Wesley or of Whitfield can be compared with the enthusiasm which everywhere welcomed them, or with the immediate visible result of their labours." They took great pains to fit their followers for the office of preachers and teachers, sending them in large numbers to the universities, and founding colleges there for the reception of their students. With an admirable largeness of view, they did not confine their studies to theology, but cultivated the whole range of Science and Art, and so successful were they, that in a short time the professional chairs of the universities of Europe were almost monopolised by the learned members of the mendicant orders.* The constitutions required that no one should be licensed as a general preacher until he had studied theology for three years. Then a provincial or general chapter examined into his character and learning, and, if these were satisfactory, gave him his commission, either limiting his ministry to a certain district (whence he was called in English a *limitour*, like Chaucer's Friar Hubert), or allowing him to exercise it where he listed (when he was called a *lister*). This authority to preach, and exercise other spiritual functions, necessarily brought the friars into collision with the parochial clergy; and while a learned and good friar would do much good in parishes which were cursed with an ignorant, or slothful, or wicked pastor, on the other hand, the inferior class of friars are accused of abusing their position by setting the people against their pastors, whose pulpits they usurped, and interfering injuriously with the discipline of the parishes into which they intruded. For it was not very long before the primitive purity and zeal of the mendicant orders began to deteriorate. This was inevitable; zeal and goodness cannot be perpetuated by a system; all human societies of superior pretensions gradually deteriorate, even as the Apostolic Church itself did. But there were peculiar circumstances in the system of the mendicant orders which tended to rapid deterioration. The profession of mendicancy tended to encourage the use of all those little paltry arts of popularity-hunting which injure the usefulness of a minister of religion, and lower his moral tone. The fact that an increased number of friars was a source of additional wealth to a convent, since it gave an increased number of collectors of alms for it, tended to make the convents less scrupulous as to the fitness of the men whom they admitted; so that we can believe the truth of the accusations of the old satirists, that dissolute, good-for-nothing fellows sought the friar's frock and cowl, for the license which it gave to lead a vagabond life, and levy contributions on the charitable. Such men could easily appropriate to themselves a portion of what was given them for the convent; and they had ample opportunity, away from the control of their ecclesiastical superiors, to spend their peculations in dissolute living. We may take, therefore, Chaucer's Friar John of the Somnour's Tale as a type of a certain class of friars; but we must remember that at the same time there were many earnest, learned, and excellent men in the mendicant orders—even as Mawworm and John Wesley might flourish together in the same body.

The convents of friars were not independent bodies, like the Benedictine and Augustine abbeys; each Order was an organised body, governed by the general of the order, and under him, by provincial

priors, priors of the convents, and their subordinate officials. There are usually reckoned four orders of friars—the Dominicans, Franciscans, Carmelites, and Augustines. They were called *Friars* because, out of humility, their founders would not have them called *Father* and *Dominus*, like the monks, but simply *Brother* (*Frater*, *Frère*, *Friar*).

The DOMINICANS and FRANCISCANS arose simultaneously at the beginning of the thirteenth century. Dominic, an Augustinian canon, a Spaniard of noble birth, was seized with a zeal for converting heretics,

FRIARS.

and having gradually associated a few ecclesiastics with him, he at length conceived the idea of founding an order of men who should spend their lives in preaching. Simultaneously, Francis, the son of a rich Italian merchant, was inspired with a like design to establish a new order of men, who should spend their lives in preaching and doing good among the people. These two men met in Rome in the year 1216 A.D., and some attempt was made to induce them to unite their institutions in one; but Francis was unwilling, and the Pope sanctioned both. Both adopted the Augustinian rule, and both required not only that their followers personally should have no property, but also that they should not collectively as a body possess any property; their followers were to work

A DOMINICAN MONK.

for a livelihood, or to live on alms. The two orders retained something of the character of their founders; the Dominicans of the learned, energetic, dogmatic, and stern controversialist—defenders of the orthodox faith, not only by argument, but by the terrors of the Inquisition, which was in their hands, even as their master is said, rightly or wrongly, to have sanctioned the cruelties which were used against the Albigenses when his preaching had failed to convince them. The Franciscans retained something of the character of the pious, ardent, faneiful enthusiast.

The wood-cut which we give of two friars with their names, DOMINIC and FRANCIS, inscribed over them, is taken from a representation in a MS. of the end of the thirteenth century (Sloan 346), of a legend of a vision of the Dominic related in the "Legenda Aurea," in which the Virgin Mary is deprecating the wrath of Christ, about to destroy the world for its iniquity, and presenting to him Dominic and Francis, with a promise that they will convert the world from its wickedness.

Dominic gave to his order the name of Preaching Friars; more commonly they were styled Dominicans; or, from the colour of their habits, Black Friars*—their habit consisting of a white tunic, fastened with a white girdle, over that a white scapulary, and over all a black mantle and hood, and shoes; the lay brethren wore a black scapulary. The Dominican nuns wore the same dress with a white veil. They had, according to the last edition of the "Monasticon," fifty-eight houses in England.

The Franciscans were styled by their founder Fratri Minori—Jesser brothers, Friars Minors; they were more usually called Grey Friars, from the colour of their habits, or Cordeliers, from the knotted cord which formed their characteristic girdle. Their habit was originally a grey tunic with long loose sleeves, but not quite so loose as those of the Benedictines, a knotted cord for a girdle, and a black hood; the feet always bare, or only protected

A FRANCISCAN MONK.

by sandals. In the fifteenth century the colour of the habit was altered to a dark brown. The Franciscan nuns, or Minoreesses, or Poor Clares, as they were sometimes called, from St. Clare, the patron saint and first nun of the order, wore the same habit as the monks, only with a black veil instead of a hood. The Franciscans were first introduced into England, at Canterbury, in the year 1223 A.D., and there were sixty-five houses of the order in England, besides four of minoreesses.

While the Dominicans retained their unity of organisation to the last, the Franciscans divided into several branches, under the names of Minorites, Capuchins, Minims, Observants, Recollets, &c.

The CARMELITE Friars had their origin, as their name indicates, in the East. According to their own traditions, ever since the days of Elijah, whom they claim as their founder, the rocks of Carmel have been inhabited by a succession of hermits, who have lived after the pattern of the great prophet. Their institution as an order of friars, however, dates from the beginning of the thirteenth century, when Albert, Patriarch of Jerusalem, gave them a rule, founded upon, but more severe than, that of St. Basil; and gave them a habit of white and red stripes, which, according to tradition, was the fashion of the wonder-working mantle of their prophet-founder. The order immediately spread into the West, and Pope Honorius III. sanctioned it, and changed the habit to a white frock over a dark brown tunic; and very soon after, the third general of the order, an

* As an indication of their zeal in the pursuit of science it is only necessary to mention the names of Friar Roger Bacon, the Franciscan, and Friar Albert-le-Grand (Albertus Magnus), the Dominican. They cultivated the Arts with equal zeal—some of the finest paintings in the world were executed for them, and their own orders produced artists of the highest excellence. Fra Giacopo da Turrita, a celebrated artist in mosaic of the thirteenth century, was a Franciscan, as was Fra Antonio da Negroponi, the painter; Fra Filippo Lippi, the painter, was a Carmelite; Fra Bartolomeo and Fra Angelico da Fiesole—than whom no man ever conceived more heavenly visions of spiritual loveliness and purity—were Dominicans.

* In France, Jacobins.

Englishman, Simon Stock, added the scapulary, of the same colour as the tunic, by which they are to be distinguished from the Premonstratensian canons, whose habit is the same, except that it wants the scapulary. From the colour of the habit the popular English name for the Carmelites was the White

A CARMELITE MONK.

Friars. They were introduced into England, direct from Palestine, by Sir John de Vesci, in the early part of the thirteenth century, and became more popular in England than elsewhere in Europe, but they were never an influential order. They had ultimately fifty houses in England.

The AUSTIN FRIARS were founded in the middle of the thirteenth century. There were still at that time some small communities which were not enrolled among any of the great recognised orders, and a great number of hermits and solitaries, who lived under no rule at all. Pope Innocent IV. decreed that all these hermits, solitaries, and separate communities, should be incorporated into a new order, under the rule of St. Augustine, with some stricter clauses added, under the name of *Ermiti Augustini*, Hermits of St. Augustine, or, as they were popularly called, Austin Friars. Their exterior habit was a black gown with broad sleeves, girded with a leather belt, and black cloth hood. There were forty-five houses of them in England.

There were also some minor orders of friars, who do not need a detailed description. The Crutched (crossed) Friars, so called because they had a red cross on the back and breast of their blue habit, were introduced into England in the middle of the thirteenth century, and had ten houses here. The Friars de Penitentiâ, or Friars of the Sark, were introduced a little later, and had nine houses. And there were six other friaries of obscure orders. But all these minor mendicant orders, all except the four great orders, the Franciscans, Dominicans, Augustinians, and Carmelites, were suppressed by the Council of Lyons, A.D. 1370.

We have now completed our sketch of the rise of the religious orders, and of their general character; we have only to conclude this portion of our task with a brief history of their suppression in England. Henry VIII. had resolved to break with the pope; the religious orders were great upholders of the papal supremacy; the friars, especially, were called "the pope's militia;" the king resolved, therefore, upon the destruction of the friars. The pretext was a reform of the religious orders. At the end of the year 1535 a royal commission undertook the visitation of all the religious houses, above one thousand three hundred in number, including their cells and hospitals. They performed their task with incredible celerity—"the king's command was exceeding urgent;" and in ten weeks they presented their report. The small houses they reported to be full of irregularity and vice; while "in the great solemn monasteries, thanks be to God, religion was right well observed and kept up." So the king's decree

went forth, and parliament ratified it, that all the religious houses of less than £200 annual value should be suppressed. This just caught all the friaries, and a few of the less powerful monasteries for the sake of impartiality. Perhaps the monks were not greatly moved at the destruction which had come upon their rivals; but their turn very speedily came. They were not suppressed forcibly; but they were induced to surrender. The patronage of most of the abbeys was in the king's hands, or under his control. He induced some of the abbots by threats or cajolery, and the offer of place and pension, to surrender their monasteries into his hand; others he induced to surrender their abbatial offices only, into which he placed creatures of his own, who completed the surrender. Some few intractable abbots—like those of Reading, Glastonbury, and St. John's Colchester, who would do neither one nor the other, were found guilty of high treason—no difficult matter when it had been made high treason by act of Parliament to "publish in words" that the king was "an heretic, schismatic, or tyrant"—and they were disposed of by hanging, drawing, and quartering. The Hospitallers of Clerkenwell were still more difficult to deal with, and required a special act of Parliament to suppress them. Those who gave no trouble were rewarded with bishoprics, livings, and pensions; the rest were turned adrift on the wide world, to dig, or beg, or starve. We do not defend the principle of monasticism; and it is not our business now to inquire whether, with the altered times of the Church, the day of usefulness of the monasteries had not passed. But we cannot restrain an expression of indignation at the shameless, reckless plunder which ensued. The commissioners suggested, and Bishop Latimer entreated in vain that two or three monasteries should be left in every shire for religious, and learned, and charitable uses; they were all shared among the king and his courtiers. The magnificent churches were pulled down; the libraries, of inestimable value, were destroyed; the alms which the monks gave to the poor, the hospitals which they maintained for the old and impotent, the infirmaries for the sick, the schools for the people—all went in the wreck; and the tithes of parishes, which were in the hands of the monasteries, were swallowed up indiscriminately—they were not men to strain at such gnats while they were swallowing camels—some three thousand parishes, including those of the most populous and important towns, were left impoverished to this day. No wonder that the fountain of public munificence in England have been dried up ever since; and the course of modern legislation is not calculated to set them again a-flowing.

ODE FOR THE INAUGURATION OF FRANKLIN'S STATUE.

SEPTEMBER 17, 1856.

GIVE welcome to his sculptured form!

The artist's perfect work is done,—
Here let him stand, in light and storm,
Our sea-girt city's greatest son.

His lineage sprung from honest toil,
Swart Labour trained his youthful hand,—
Want led him from his native soil,—
Where first he breathed let Franklin stand.

His genius stamped the Press with power;
His glance the glowing future saw;
His science curbed the fiery shower;
His wisdom stood with Peace and Law.

The world his story long has shrined,—
To Fame his spotless deeds belong;
His homely truth, his ample mind,
His Saxon hate of human wrong.

Room for the grey-haired patriot-sage!
For here his genial life began,—
Thus let him look, from age to age—
And prompt new Thought, enobling man.

DOSTON, U. S.

J. T. FIELDS.

OBITUARY.

SIR RICHARD WESTMACOTT, R.A., D.C.L.

A VACANCY occurs among the members of the Royal Academy by the death of Sir Richard Westmacott, R.A.: this veteran sculptor died at his residence in South Audley Street, on the 1st of September, in the eighty-third year of his age.

It is now nearly twenty years since the public has seen any new work from the hand of this sculptor, but his previous life was one of great activity; a large number of the national monuments and statues of the period were executed by him, as well as of ideal subjects commissioned by private individuals: in fact, for some years he and Chantrey engrossed a very considerable portion of the patronage of the public in their art,—for though the death of Flaxman did not take place till 1826, his works of a former character were comparatively few during the closing period of his life.

London has been the birthplace of many of our greatest sculptors—Wilton, Banks, Nollekens, Bacon: the metropolis has also a certain right to claim Flaxman, for though he chanced to be born in York, while his parents were staying there for a short period, London was their home, and hither the embryo sculptor was brought soon after his birth. To this list must be added Westmacott, who was born in 1775, in Mount Street, Grosvenor Square, where his father, a man of education, carried on the business of a statuary. The son, showing early signs of the talent which after years developed, was instructed by his father in the elements of his art, and was then sent to Rome, in 1793. There he entered the studio of Canova, under whom he made such progress, that he obtained the first gold medal from the Academy of St. Luke, for a bas-relief of a subject in the history of "Joseph and his Brethren," the year following his arrival in Rome: the prize was one offered by the Pope. In the next year he received a prize from the Academy at Florence, and was elected a member of that institution. Having passed about five years among the Art-treasures and schools of Italy, he returned to London, and established himself in London, not far from the residence of his father; unwilling, however, that love affairs and matrimony should at any future time distract his thoughts from his profession, and occupy the time that ought to be devoted to it, he at once, though only twenty years of age, married both "wisely and well," the lady being the daughter of Dr. Wilkinson. The young sculptor soon rose into public favour, his reputation having mainly arisen, according to a statement in the *Literary Gazette*, "upon the occasion of a design for some public work being thrown open to general competition. Westmacott's design was so remarkable as to induce the judges to issue a second and higher prize for studies of the same subject." In 1805 he was elected Associate of the Royal Academy, and Academician in 1812.* In 1827 he was appointed Professor of Sculpture at the Academy in the room of Flaxman, and held the office till his decease, although his last lectures were delivered in 1854. He received the honour of knighthood in 1837, and was made a D.C.L. of Oxford in the same year.

The principal public works executed by Westmacott are the monuments to Sir Ralph Abercromby, Lord Duncan, Lord Collingwood, Sir Isaac Brock, Captain Cook, General Gibbs, and General Pakenham, in St. Paul's; the statues of Addison, Pitt, and Sir John Malcolm, in Westminster Abbey; the monuments to the Duke of Montpensier, Mrs. Warren, Spencer Perceval, and General Villettes, also in Westminster Abbey; the statue of Lord Erskine, in the old hall of Lincoln's Inn; of Locke, in the library of University College; of the Duke of York, on the column in Pall-Mall; of the late Duke of Bedford, and of Fox, in Russell and

* All the public journals that have noticed the death of this sculptor, so far as they have been seen by us, give 1816 as the date of his election into the Academy; but on referring to our file of catalogues, which does not, however, extend so far back as that year, we find in some of a more recent date that the work he presented on his election—"Ganymede," an *alto-relievo* in marble—is dated 1812; the same year stands also against the diploma works of James Ward, Sir Robert Smirke, E. H. Baily, and the late H. Bone, P. Reinagle, and Sir D. Wilkie. It is scarcely probable Westmacott would have given his diploma sculpture four years before his election.

Bloomsbury Squares respectively; of Nelson, in the Liverpool Exchange; the colossal Achilles, in Hyde Park; a monument to Warren Hastings, in the Cathedral of Calcutta; and, conjointly with Flaxman and Baily, a portion of the figures on the frieze of the marble arch removed from Buckingham Palace to Cumberland Gate; and the sculptured pediment in front of the British Museum.

Of his principal ideal works we may point out his "Psyche" and "Cupid," in the possession of the Duke of Bedford; the "Distressed Mother," executed in 1832, and now in the possession of the Marquis of Lansdowne;* the "Happy Mother," exhibited in 1835; "Euphrosyne," executed for the late Marquis of Westminster—all of which have been engraved in the *Art-Journal*: "A Nymph preparing for the Bath," in the collection of the Earl of Carlisle; a "Sleeping Infant," in the possession of the Countess of Dunmore; a group entitled "The Dream of Horace," an *alto-relievo*, exhibited in 1825, under the title of "Afflicted Peasants," "Devotion," a statue in marble, exhibited in 1835; a "Gypsy," in 1833; "The Abolition of the Suttees," a group in bronze for the pedestal to a statue of the late Lord W. Bentinck; a beautiful *basso-relievo*, exhibited in 1820, entitled "Maternal Affection," part of a monument erected in Hurst Church, Berkshire, to the memory of a lady; "Cupid Captive," exhibited in 1827, now at Petworth; nor must the *basso-relievo* be forgotten which ornaments the pedestal of the statue of Addison; it represents the "Muses," and displays much taste and gracefulness of design, with care and delicacy of execution. A monument to the late Countess of Rocksavage is another of Westmacott's monumental compositions that is much admired.

With the exception of the "Psyche," which belongs to the "Canova School" of sculpture, the works of Sir R. Westmacott have more of the feeling of the old Roman sculptors, than of the artists of a later period; that is, they exhibit simplicity of style almost approaching to severity, rather than the graceful and softened expression which is generally the characteristic of modern sculpture, and, in a higher degree, of the works of the Greeks in their best time: he was less idealistic than naturalistic, even in his imaginative subjects. He utterly rejected all superfluities of ornament, everything approaching to a florid style, and was satisfied to present his figure as the result of a thoughtful, reflective mind, rather than of one under the influences of poetical imagery; and yet he was far from being prosaic. His purity of taste, and his knowledge of what constitute the highest qualities of his art, elevated him as much above the poverty of the one as it restrained him within a reasonable expression of the luxuriance of the other. If he never reached the highest points of grandeur or beauty, he was always chaste, dignified, and impressive.

Sir R. Westmacott's lectures at the Academy were indicative of the scholar; in simple, yet forcible, language he set forth the knowledge he had acquired by the study of the antique; without any attempt at rhetorical display, he gained the attention of his audience by the truth and earnestness of his remarks. We presume his son, Mr. R. Westmacott, R.A., will succeed him in the professor's chair—a distinction to which he is eminently entitled: for the Academy has no better scholar, nor any more accomplished gentleman.

M. JEAN MARIE ST. EVE.

We record, with much regret, the recent death, in Paris, of M. St. Eve, a French engraver of very considerable talent, whose "St. Catherine," after Guido, appeared in our last publication. He engraved several plates from the works of Raffaele, and, at the time of his death, was engaged upon a large plate, a commission from the French Government. His decease was not altogether unexpected, as he had been, for some time past, in a very delicate state of health. He was in the forty-sixth year of his age.

* This very beautiful and affecting group was originally executed for a monument to Mrs. Warren, widow of the Bishop of Bangor; but when exhibited at the Academy, the Marquis of Lansdowne so greatly admired it, that he solicited to have it surrendered to him. The request was courteously acceded to, and a duplicate was afterwards finished for the monument. A third group has subsequently been executed for Mrs. Ferguson, of Beal, near Raith, in Scotland. *Vide Art-Journal*, 1849.

ART IN CONTINENTAL STATES.

PARIS.—The church of Notre Dame was completely painted and decorated for the ceremony of baptising the young prince; the decoration has been left, in order to judge of its effect, with a view to its being properly executed if after due deliberation it is approved of; the opinion seems at present to be that it detracts from the solemnity of a Gothic cathedral.—A group in marble, by Emile Chartrouze, has been placed in the Versailles Gallery, representing "Queen Hortensia educating Louis-Napoleon in 1822." The minister of state has commissioned of M. Lazerge a picture of the Emperor distributing money to the sufferers at Lyons.—M. Raffel has received an order from the Archduchess Sophia for five drawings.—In digging a foundation at Troyes, a magnificent mosaic for a saloon has been discovered in perfect preservation; it is of the period of the third or fourth century.—The Museum of Nancy has been enriched with four medallion portraits of Prince Charles, Madame Charlotte, Madame Elizabeth, and Marie Antoinette; they formerly belonged to the last unfortunate royal lady.—M. A. Fould has purchased for the Government the statue of "Angelica chained to the Rock," by M. Truphème.—A collection of drawings has also been purchased, for a sum of 34,000 francs, for the Louvre; it is known under the title of the "Collection Valadi, of Milan," and consists principally of drawings of the early schools of Florence, Bologna, and Milan, including six by Leonardo da Vinci.—M. Amaury Duval has finished the decorations of the Church of St. Germain en Laye; the subjects chosen by the artist are—the "Sermon on the Mount," the "Good Samaritan," the "First Place at Table," the "Parable of the Vineyard," the "Prodigal Son," and "Christ crucified;" they are executed in fresco.—Several pictures have been ordered by the Government, and will be placed in the gallery of Versailles: M. Glaize received a commission to paint the "Distribution of the Eagles;" M. Jalabert, the "Visit of Queen Victoria;" M. Larivière, the "Entry of the President into Paris;" M. Ange Tessier, the "Completion of the Louvre." Mademoiselle Rosa Bonheur is engaged on a large canvas, the subject of which is "Spanish Contrabandistas." M. Antigna has proceeded to the scene of the late inundations on the Loire, to collect materials for a large picture commissioned by the Government, representing the "Emperor at Tralaze relieving the Distressed."

BERLIN.—The King has commanded that the marble statues of the heroes of the Seven Years' War, which ornament the Wilhelmsplatz, shall be reproduced in bronze, as they were beginning to be much discoloured, and to exhibit symptoms of decay. The models for those of Ziethen and Seidlitz are completed, and they will be followed by those of Dessau and Keith. Schwerin and Winterfeld, who have been presented in Roman costume, will be remodelled by Kiss in the costume of their time.

The pendant to Kiss's Amazon, and intended to be placed on the other side of the entrance to the Museum, is in progress under the hand of the sculptor Albert Wolff. It represents a naked youth mounted on a horse, and contending successfully against a lion that has attacked him.

ROME.—Signor Zabris, director of the Papal Academy of Arts, has just sent to Ripa Grande, to be conveyed to Civita Vecchia for shipment to St. Petersburg, the last portion of a work of extreme colossal dimensions. For many years nothing on so large a scale has been executed at Rome, as it exceeds in size even Crawford's Washington. The subject of the work is the athlete Milo in his last moments—he who was victor in the games at Delphi in the 50th Olympiad. He is said to have possessed such bodily strength as to bear on his shoulders a living ox across the arena, and slay the animal with his fist. In his advanced age, he saw an oak by the way-side partially riven, perhaps by lightning, and he conceived the idea of severing the tree entirely; he made the attempt, but in the effort his arm became fixed in the cleft of the unyielding tree, and he, thus helpless, became the prey of a wild beast. The subject has often been treated by sculptors, but never on such a scale as this.

VENICE.—Mr. Parker has purchased from the proprietors of the Manfrini Collection a number of works, among which are the famous "Giorgione," one of the *chefs-d'œuvre* of the collection, also the Pordenones, the portrait of Ariosto, by Titian, and others at the price of 8000 napoleons. The Academy of Venice is treating with the proprietor of the gallery for the purchase of other works, for which purpose the Emperor of Austria has placed a considerable sum of money at the disposal of the Academy.

BRUSSELS.—The artists of Brussels have just founded a Water-Colour Society similar to those in England.

TITANIA.

FROM THE BAS-RELIEF BY F. M. MILLER, IN THE POSSESSION OF J. H. FOLEY, A.R.A.

WE introduce an engraving from this small but elegant example of sculpture with more than an ordinary feeling of pleasure, for the original is the result of a commission given by one sculptor, who has justly achieved fame and honour, to a younger brother artist, who has yet a name to win. Mr. Foley, having seen the plaster model of the work, immediately requested that it might be executed for him in marble, and has caused it to be inserted, as a panel, in a piece of furniture in his drawing-room.

"A Midsummer Night's Dream," in which, as all are presumed to know, Titania is ushered into our world, has always been admired as one of the most marvellous creations of Shakspeare. The most eloquent critics and the most subtle metaphysicians have confessed their total want of power to analyse its beauties. One can no more divide and detail its parts than we can separate the colours of the rainbow—it is a *dream*. As the reader peruses the play he attempts to rouse himself from the beautiful vision, and to test his real vitality by some tangible effort. The boundary line between mind and matter is so imperceptibly fine that actual existence seems an enigma. Whether the poet intended to convey to his readers the spirit of the season we love so intensely under the name of "Summer," or to place before us, as in a mirror, the contrast between Material and Intellectual Beauty—the one liable to decay and death, the other imperishable and infinite—or between Ignorance and Knowledge, may be a matter for argument or speculation. The tendency of such illustrations of Shakspeare as that before us must be to enlighten and to elevate, by awakening the reflective powers, enlarging the ideas, and alluring mankind to as much solid earthly happiness as is founded upon moral purity and a love of the simple beauties of nature.

Few of the writings of our immortal dramatist present so many varied subjects for the painter and sculptor as "A Midsummer Night's Dream," though there are in it scenes and characters which would almost baffle the power of any artist to illustrate. The fairies, however, are not among the number; a refined and poetical imagination may hold converse with the "tiny people," though, to quote the poet's own ideas in another play, they "feed not upon the same meat as ourselves;" and may not we suppose that a group of them was at the side of the sculptor when, with a gracefulness almost Athenian, he portrayed the spouse of Oberon, slumbering in beauty—

"Quite o'er-canopied with luscious woodbine,
With sweet musk-roses, and with eglantine"—

beneath the soft moonbeams of a summer night? Her subjects, the elves, have crept into acorn cups, or have hidden themselves beneath harebells, or have climbed up the stem of the foxglove, and laid down in its purple flowerets. The queen, whose jealous husband has squeezed the juice of flowers on her eyelids, having cast aside her diadem—the pearls of which are dewdrops—and her sceptre—

"The graceful stem of some fair plant"—

reposes on a bed of leaves, exquisitely beautiful in form and arrangement, with a flower-bud for her pillow. The sculptor, with a refinement of feeling that proves his true and thorough appreciation of Shakspeare, has, by a few dextrous, yet perfectly natural, curves of the foliage, traced the form of an angel's wing beneath the round and polished shoulder.

The conception of this work is, to our minds, eminently beautiful: the *delicacy* of the composition is equalled, we think, by the gracefulness with which it is carried out, and the disposition of light and shadow renders the whole subject most effective. The sculptor has judiciously placed the limbs in that easy, careless position which suggests to the mind's eye that it is not merely a dream which the fairy queen is enjoying, but "A Midsummer Night's Dream"—hulled into slumber by the "melodies of the spheres," and on a couch fragrant with the sweets of a thousand flowers.

TITANIA.

ENGRAVED BY J. H. BAKER, FROM THE BAS-RELIEF BY F. M. MILLER.

THE MANCHESTER MECHANICS' INSTITUTION: ITS INAUGURATION.

THE Mechanics' Institution of Manchester is now a structure as aristocratic in character as any modern edifice of the kingdom; it is the result of no sudden enthusiasm, the birth of no accident; but the growth of thought and labour, energy and enterprise; and its members are well entitled to the monument they have raised—an ornament and an honour to the great city of commerce and manufacture. Although we believe very few of these "members" are actually "mechanics," they are no doubt generally of the class for whose mental improvement it is a solemn duty to provide: such provision has been made in that liberal spirit which characterises all the movements in Manchester. Its wealth is great; it has been obtained by no wild speculation, nor by any spasmodic effort, but by continual toil—perhaps, indeed, by toil overmuch; but nowhere is there to be found a more valuable illustration of the proverb, "diligence maketh rich." It is "grand," in the better sense of the term, to note the large number of costly buildings rising in every quarter of the city; and especially so in reference to those prodigious warehouses in which the graces of architecture are added to those of necessity or convenience. "Institutions" are increasing, national monuments are accumulating, the perpetually-thronged streets are assuming a character of elegance; and from having been among the clumsiest and "dirtiest" town of England, Manchester has become already a city in which wealth has combined with taste, in which public spirit has gone hand in hand with prudence, and judgment has laboured as the coadjutor of liberality. The quarter in which stands the New Manchester Mechanics' Institution has less than other parts been subjected to improvement; but ere long, no doubt, it will be the centre of an assemblage of structures dignified and graceful in motive and in appearance. The building is rather appropriate than fine; it is impressive from its stern simplicity, and does credit to the architect, the late Mr. Grogan, who carefully studied fitness and propriety. Its exterior is that of a building designed to accommodate a third or fourth generation of those who erect it. The several rooms—lecture-rooms, class-rooms, &c.—are spacious, admirably constructed as to light and sound, and partake of the general character of the edifice—that of substantial convenience.

Our business, however, at this moment is with the Exhibition of Art and Art-Industry by which it was inaugurated:—"The Exhibition was projected for the double purpose of contributing to the intellectual improvement and æsthetical enjoyment of those who may visit it, and also of obtaining money to liquidate the debt which rests on the Institution. There have been five previous exhibitions in connection with the old institution, which were progressively successful, realising to it a considerable amount of pecuniary profit, and affording no small degree of gratification to many thousands of persons."

The ceremony of inaugurating the new building took place on the 9th of September; the domestic loss which the prime-minister has sustained prevented his being present—a circumstance very prejudicial to the society, and for which it is to be hoped his lordship will make compensation by honouring the Institution with a visit during the autumn or winter—for we believe its exhibition will continue open for six months. Instead, therefore, of an imposing ceremony, as intended, the proceedings were confined to a brief address by the president, Oliver Heywood, Esq., who spoke entirely to the purpose, with much good sense, and occasionally with a degree of earnestness amounting almost to eloquence, in the presence of a very large number of the magnates of the city. He commenced by a brief reference to the origin of the building:—

"We thought that the past history of the institution, which was among the earliest of its class, and which has contributed so largely to the intellectual, social, and moral improvement of the community, might be traced with interest and advantage from its day of small things, during a long and successful career, until when, self-supporting, free from debt, with 1600 members, of whom 900 were in regular attendance at its day and evening

classes, and with a library of 16,000 volumes, with an annual circulation of 55,000 volumes, the building which it had occupied for a quarter of a century—let it be remembered to the credit of Manchester that it was the first erected in this country for such a purpose—was found inadequate to meet the demands of a growing community, and an appeal was made for assistance to enable us to provide accommodation for those to whom, for lack of space in Cooper Street, we were under a necessity of refusing admittance into the classes. With what success, you see!"

He continued:—

"The Exhibition which we open to-day is the fifth which has been undertaken, and successfully carried out, by the directors of this institution. Their fame is long gone by, eclipsed by the grander conceptions of later times—by the exhibitions of London, Dublin, and Paris; yet Manchester may recollect with pride that she was the first to set the example of these industrial exhibitions, and that the announcement which the directors were able to make at the conclusion of the first, now twenty years ago, that although, after having been visited by upwards of 60,000 people, it had closed without wilful injury to any single article exhibited, led to the opening of the museum and other institutions in the town, and was the circumstance upon which Mr. Hume, in the House of Commons, grounded his motion for the opening of the British Museum."*

The national anthem having been sung, the exhibition was formally declared to be open, and the assemblage divided to walk through the rooms and examine their contents. We shall follow them. The exhibition, though not supplied with a very varied collection of the works of Art-Industry, has this strong recommendation—it contains the best productions of the best manufacturers; such contributors as Hancock, Elkington, Minton, Copeland, Jackson and Graham, Winfield, the Colebrook Dale Company, Jennens & Bettridge, &c. &c., have expressed their respect for Manchester, and their value of its judgment, by selecting nothing upon the "it will do" principle, but have forwarded the choicest specimens of their several establishments. Consequently, as a practical lesson to those who examine the exhibition for study, it will be of the highest importance.

As usual, the first days were partly occupied in unpacking; the contribution of "the Emperor" was late, yet in sufficient time to be displayed at the opening, at three o'clock, although an hour or two previously all things seemed in confusion; labour, however, was not left to hired hands, the committee "set to with a will," and although many additions have been since made, and works are daily arriving, yet the visitors, in traversing the rooms, saw what was amply sufficient to justify a warm congratulation to the directors on the very elegant and appropriate inauguration of the New Mechanics' Institute—to which in the course of a few months its members will remove.

Immediately on entering a sufficiently spacious hall, and at the foot of a wide stone staircase, is the news and reading-room; here have been placed, arranged on a circular stand, about forty of the fine productions of Sèvres—sent by express order of the Emperor of France: they are of varied character, from the *petite toilet* service to the huge vase six feet high. Besides these are several "paintings on porcelain," of the highest possible interest, and a number of examples of the beautiful work of Beauvais—the latter gracing one of the wide passages which lead from the reading-room to the principal entrance. In this room also are several bronze pilasters and lamps, contributed by Mr. Potts, of Birmingham; several doors and panels of much excellence, by Messrs. Crowther and Son, of Manchester; a small collection of articles in hardened Indian-rubber; some table tops and pillars in glass mosaic, by Mr. Stevens, of Pimlico; a recess con-

* The president paid a well-merited compliment to the directors:—"I should like, too, to say that during the four years it has been my privilege to preside over this institution, the average attendance at the board, which consists of eighteen members, has been seventeen, and for the present year they have on no occasion met less than the full complement of eighteen, saving the misfortune of one member absent from sickness, and one only from an unavoidable engagement." We ourselves may bear testimony to the energetic exertions of those who were entrusted with the arrangement of the Exhibition, and the placing in order of the various contributions; and especially we are bound to allude to the merits of the intelligent secretary, Mr. HUTCHINGS, who deserves and will receive the thanks of all parties—the society, the exhibitors, and the public.

tains the famous silk hangings, table-covers, &c., of Messrs. Houldsworth, of Manchester. But unquestionably the most attractive and important feature in this division of the building is supplied by the works of the justly renowned establishment at Colebrook Dale. The apartment is partially divided by gates of much elegance, suited for the entrance to grounds of ordinary character; they are of comparatively small cost; the design is purely Italian, and present a happy mingling of strength and lightness. It is worthy of record that these gates were in pig-iron only a week before they were placed in the position they now occupy. To give anything like a detail of the several objects contributed by this company is out of the question; it must suffice to say that they consist of vases, table ornaments, kitchen ranges, chimney-pieces, garden fountains, garden chairs, tables, chandeliers, sun-dials, fenders, and numerous others, all of great excellence in design, and of workmanship so skilful as fairly to rival the best of their competitors in bronze. But the company employ not only good and skilful artisans—they apply for models to the best artists; and foremost among those of whose aid they have wisely availed themselves is Mr. John Bell, whose mind is perceptible in various works, from the beautiful statue which sustains the fountain to the stand which is to contain the umbrella. For the perseverance they have exhibited, the liberality they have displayed, and the accomplished skill with which every department of these famous works is conducted, their directors deserve the honours they receive, and the success by which their labours have been rewarded.

A passage, occupied, as we have observed, by the exquisite productions of Beauvais, leads into a beautiful drawing-room, fitted up by Messrs. Jackson and Graham, and containing the cabinet which obtained not only golden opinions, but the great medal of honour at the Exhibition in Paris. This room is so perfect in its contents and in its arrangements, as to present a model which the refined and the wealthy might follow with advantage: its sofas, chairs, flower stands, chandeliers, mirrors, picture frames, chimney and table ornaments, tables, work tables, &c. &c.—all the produce of this eminent firm, or its special importations—are of the highest excellence. Mr. Graham has paid to Manchester the compliment of believing, and of acting on the belief, that their wealth and taste must be ministered to by a supply only of what is rare, beautiful, and thoroughly good.

Passing from this room, we enter one that is chiefly devoted to the contributions of the India House; these have been judiciously selected by Dr. Royle, chiefly with reference to the great trade of Manchester. Here also we find a looking-glass, tastefully designed and carefully executed by Mr. H. Whaite, of Manchester, and some good tables of buhl and marqueterie, contributed by Mr. Wells, of Regent Street, London.

A room leading hence, and through it into the side entrance, contains a large number of the productions of Messrs. Minton and Co., and Mr. Alderman Copeland; two large stands contain the best productions of these eminent firms. They are such as the public are well acquainted with, and duly estimate; and it will suffice to say that the selection has been made so as to comprise a very large proportion of their best works of the several classes—statuary, vases, &c. &c. In the same room, also, is a collection of the works of Mr. Alcock, which, although by no means to compare with those that stand beside them, are creditable as mingling utility with elegance.

Of glass we regret to find there are no specimens exhibited—an evil we trust to see amended; for an accession might thus be made that would materially increase the interest of the exhibition.

Ascending the staircase, we arrive at the LECTURE HALL; at present this large and happily constructed room contains little except some garden chairs of the Colebrook Dale Company, a few large pictures, several busts, and a series of about twenty statues, which are here seen to great advantage. These are the works of MacDowell, Foley, Bell, Marshall, and Lough—our readers are acquainted with all of them; here also are two or three bas-reliefs of delicious character by F. M. Miller, Mrs. Thorneycroft's bust of the Queen, and Behnes' statuette of Godiva. A gallery runs round the hall; here are the busts; the

statues are admirably placed, and we trust that circumstances will not cause their removal.

A long and comparatively narrow chamber leading hence, contains a number of beautiful works in silver, contributed by Mr. Hancock, of New Bond Street. The most important of these are the Commemoration or Testimonial Groups, and especially those which are the work of Mr. H. Armistead. Several of these, although of small proportions, are of excellence sufficient to justify criticism as if they were models for execution the size of life. The artist is evidently a man of genius—yet one who willingly condescends to “small things,” for an exquisite tazza, and an inkstand of very true and graceful character are also of his design. Mr. Hancock has been a liberal and valuable contributor, and the committee owe him much for the good service he has rendered. In this room also are three large cases filled with the best productions of Messrs. Elkington; of these it will suffice to say there seems to have been omitted nothing that could manifest their zeal for the cause they have thus generously—and it may be added wisely—assisted in Manchester. Here also is a very pleasing, although limited, selection of the productions of Messrs. Jennings and Bettridge; and a bedstead of brass and iron, and an elaborately wrought cradle, the work of Messrs. Winfield and Son, of Birmingham.

In a small room off this—the second floor—are exhibited the admirable stamped leather works of Leake and Co.; three or four beautiful examples of the decorated slate of Messrs. Magnus; while the walls are hung with the chromo-lithographs of Hanhart and Rowney, and the remarkable works executed under the patent of Mr. Baxter.*

Ascending to the third floor we have but one apartment, the ceiling of the lecture-room absorbing the remaining space. This room contains *eighty* drawings from the pictures of Her Gracious Majesty the Queen and his Royal Highness Prince Albert, which it has been our gratifying privilege to contribute to the exhibition of the Mechanics' Institution. Under the charge of Mr. Thomas Agnew, the Manchester publisher of the “Royal Gallery,” they have “fared well,” receiving the full honour to which they are undoubtedly entitled; not alone because of their exceeding value and interest as works of Art, but as bringing palpably before the visitor the Royal Collections at Osborne, Windsor Castle, and Buckingham Palace, to which it is impossible the people can have access. The majority of these pictures are from the collection at Osborne; it is here are gathered the works of modern artists, of which the other galleries contain few; and these are entirely the private purchases of her Majesty and her illustrious consort, many of them being “birthday gifts”—for it cannot, we think, be amiss to state that annually the gift of the Prince to the Queen is a picture, and the same on the birthdays of the Prince, when the present of her Majesty to him is a painting, either by a British or continental artist.

Of these eighty pictures many are heirlooms of the crown, acquisitions of the several sovereigns, her Majesty's predecessors; there are three of the famous Canalettos, of which the corridor at Windsor Castle contains forty; there are two examples from “the Rubens Room,” three from “the Vandyke Room,” and one from “the Zucarelli Room,” at Windsor Castle; several others are from the collection of the Dutch and Flemish schools at Buckingham Palace; this collection is undoubtedly the

choicest in the world as regards these masters—so Dr. Waagen considers it; a fair idea of its contents may be formed from the examples which these copies exhibit—in the works of Wouvermans, Cuyp, Teniers, Mieris, Vanderheyden, Rembrandt, &c.

These eighty drawings have been very judiciously framed and placed by Mr. Agnew; the room is hung with crimson cloth; the royal arms surmounts the entrance; and all has been done that could be done to give due effect to the collection, and to manifest the estimation in which they are held by the committee: even considered apart from the other attractions of the building, this exhibition alone is a valuable acquisition to Manchester, and may prove, as we trust it will do, very beneficial to the cause of its Mechanics' Institute. So rare and beautiful a collection of drawings has never been, and probably never will be again, gathered together. Thus the design of her Majesty and the Prince in granting to us this munificent boon will be extended in its beneficial influence: their purpose was to enable others to enjoy the Art-luxuries they have acquired: the Work in which they are engraved, largely disseminates this enjoyment; but it will be still greater to the tens of thousands who are thus enabled to examine the true and beautiful collection of copies here placed for their pleasure and instruction.

Ascending to the highest floor of the building, we arrive at a series of class-rooms, in which are placed a collection of paintings, a large assemblage of photographs, and in one comparatively small chamber a “rich and rare” museum of ancient Art, chiefly the contribution of Charles Bradbury, Esq.—one of the many admirable gentlemen who, in the midst of labour to acquire wealth, find time to think of intellectual luxuries, and to learn how much of happiness may be derived from intercourse with the ministers of mind and taste. A list of this gentleman's contributions would occupy a page; they are chiefly of ancient and Mediaeval Art, and are of exceeding value. In this room also are a few exquisite gems—carvings in wood by Rogers, and one deliciously carved flower, the work of Wallis, of Louth, who has justly earned a reputation that has gone over the world, and in his particular line is unrivalled either in England, Germany, or France.

To examine the picture gallery with anything approaching accuracy would require more space than we can allot to the whole of our report. It consists of some 500 pictures, so judiciously selected that assuredly in the whole there are not a dozen works of mediocrity; while, as certainly, more than half of them are the best productions of the best artists of Great Britain.* This will not appear at all strange when it is remembered that Manchester, and the districts adjacent, have been during the last ten years the great purchasers of the most excellent works annually produced—of almost all of them; for when the case of an artist of the highest eminence is giving birth to a picture of more than ordinary merit and value, it is safe to foretell that its destiny is Manchester, or “thereabout.” In Preston alone there are four collectors, each of whom has expended some £10,000 a year in the acquisition of British pictures. And be it remembered this is—to speak in merchant phrase—a new market. Some ten or fourteen years ago, it was to this neighbourhood the dealer in “old masters” invariably wended his way. At the doors of the manufactories he unloaded his carts, and with them he left his “Raffaels,” “Titians,” “Rubens,” and “Teniers,” obtaining in return sums which gave him a profit of a thousand per cent upon his investment with the poor painter who had worked up an aged and worn canvas to bear the names of the great masters in ancient Art. Such miserable frauds are now matters of gone-by history. It would be more easy to deceive Mr. Hancock into buying a piece of pebble for a diamond, than a manufacturer of Manchester into purchasing a Titian, for the authenticity of which he had only the word of a dealer—in the belief that he was hanging upon his walls a veritable example of the painter. The consequence is that “the dealer in old masters,” when he approaches

Manchester now-a-days, turns off the road, while the modern artist finds there his best recompense of homage and substantial reward.

We are compelled to postpone for a month an examination of this collection; it is impossible for us to find space for it now; but we ought not, therefore, to omit an essential duty in expressing our high admiration of so many gentlemen who have thus for a long period deprived their homes of their most cherished enjoyments—sacrificing so large a portion of their pleasure for the pleasure of others.

We have given to this interesting topic the utmost space we can this month afford. The inauguration of the Manchester Mechanics' Institute has been a great success. In the city which, next to London, holds the highest rank in importance, population, and perpetual service to the world and to mankind, it is above all things essential that taste should be ministered to rightly—that everything should be, as far as possible, auxiliary to improvement. In this exhibition much may be learned, and nothing that is to be hereafter unlearned. But the advantages to be derived from it are by no means limited to its duration. It is one of the plans by which benefits are to be extended to many generations yet to come. The Manchester Mechanics' Institution, now located in an extensive, convenient, and elegant building, to the erection of which the inaugural exhibition will largely contribute, is an institution for the instruction of its people. We cannot do better than quote from the *Manchester Examiner* a passage which gives eloquent expression to this essential part of the subject under consideration; and have but to add that we shall next month increase our report by such further communications as may seem expedient or necessary:—“What would the last generation of workpeople have given for advantages such as these? Young men of this city, the responsibility is fairly thrown upon you! No sort of excuses will acquit you twenty years hence if you grow up in ignorance. There is no defect in your previous training, no educational misfortune, springing from the unpropitious circumstances of your earlier years, which you may not now remedy if you will. It is impossible to estimate the good which has accrued from the Manchester Mechanics' Institute during the thirty years of its existence. Directly, it has been the means of affording a useful education to thousands who are now discharging the duties of life, how much the better for the blessings they reaped within its walls! Many hundreds of young men who started life with an average elementary education, have found in its classes the means of improving themselves in one or more of those branches of knowledge which are necessarily in demand in a commercial and manufacturing city like Manchester.”

THE ART-TREASURES' EXHIBITION AT MANCHESTER.

THE success of this great experiment is now assured. It was scarcely doubtful from the first, for, placed as it was in the hands of a number of gentlemen of thorough business habits, there was assurance that all needful details would be practically worked out; and that the *idea* was merely as the title-page to a book—a huge volume, of which every sentence is to be closely and carefully considered. The committee is a “working” committee, who do not content themselves with lending their names and consigning their duties to subordinates; they are among the first men of Manchester in wealth and position, but they are of those who know that wealth and position are acquired and retained only by thought and labour; and they are willing to think and to work, in order that in their allotted task there may be no hazard of failure. They are now arranging their staff. Mr. Scharf, whose name is so honourably associated with many useful and able works in Art-literature, is appointed their Art-secretary, Mr. Minchin continuing as financial secretary. It was a wise step to divide duties so opposite, and which never could have been satisfactorily performed by one person. Mr. Peter Cunningham, a gentleman eminently qualified for the task assigned to him, is to form the catalogue, and generally, we believe, to

* Among the many instructive objects which at the moment appear to be of small consequence, but which are really of great importance, we are anxious to select one for special notice. There are few things in Art less satisfactory than map engraving: it is no easy matter to introduce upon a given space a large number of names, which can have neither order nor arrangement, but must stand exactly where they are to indicate places. It is seldom the engraving is clear and distinct, as well as of unquestionable purity. A map of Lancashire and Yorkshire, with the view to act as a guide to the railways of the district, we may accept as a model of entire excellence. It is a lithograph; but we imagine a transfer from copper, and is produced and issued by Mr. Falkner, the eminent lithographic artist and publisher of Manchester. It is impossible to convey a just idea of the extreme elegance with which this small map has been executed; every word is so skilfully engraved as to bear the scrutiny of the magnifying glass, while the lines are equally clear and satisfactory. As a specimen of “map draughtsmanship,” we have seen nothing so excellent; the artist is consequently an acquisition of no slight importance in a city like Manchester, where so much of that class of work must be required.

* The collecting of these works, and the subsequent hanging of them, was confided to Mr. Thomas Agnew, Jun., who must have had immense labour in so admirably performing his allotted task. The hanging is especially judicious; the rooms are exceedingly good as to light; and the pictures have been almost invariably so placed as to “look their best.”

superintend the arrangements of those departments which embrace the various interests not included in those which appertain to pictures. There can be no question of his ability, and as little of his zeal and industry. Any portion of the stupendous plan will be safe in his hands. Mr. Deane is the general manager, whose business it is to act upon the suggestions and work out the plans of the committee. He is the hand which many heads will guide; and ample and beneficial employment will be found for him under their wise administrative faculties.

The building is already rising rapidly. It is distant two miles from Manchester; but the space is shortened by a railway, which conducts to one of the gates, and omnibuses will run every five minutes for a sum of twopence from all parts of the city. It is worthy of remark in passing that this machine in Manchester is spacious and convenient—a comfortable vehicle, such as we of London have no conception of. Mr. Salomons, the architect, Mr. Dredge, the engineer, and Mr. Young, the contractor, are proceeding fast with their work, which will be finished—and well finished—by the stipulated time. The site is in a quarter where the city smoke is little felt; and, by the way, the smoke consuming act has had great effect in Manchester. Although the front and back of the building are of brick, the huge sides and roof are of iron; security is thus obtained against danger from damp; and the floors are raised about three feet from the ground, there being a full circulation of air underneath.

The building is not, and is not intended to be, handsome. The front is sufficiently elegant: taken alone, indeed, it is a graceful example of what may be done in the way of beauty with coloured bricks; but it would have been worse than idle to waste decoration upon dead walls: and no other than dead walls are required; for all that is looked for is space, upon which to hang pictures closely, commencing about three feet from the ground, and terminating about the same distance from the roof.

There will be space to hang between four and five thousand pictures; and that the committee will obtain so large a number there cannot be a doubt. It is probable they will be enabled to select from thence that amount, for already nearly all the best collections of pictures, ancient and modern, have been placed at their disposal, commencing with the gallery of Her Majesty the Queen (who lends forty pictures), and terminating with the dealers in London and elsewhere (who will gladly be contributors) and embracing almost half the nobility of the kingdom.

As regards a supply of pictures, therefore, all doubt is at an end. England contains enormous wealth in this way. That is well known; but it is hidden in venerable receptacles, out-of-the-way mansions, or in galleries which a strange footstep seldom treads. Such a collection of Art-treasures will be gathered as will astound the world.

But pictures form only a part of the approaching Art-feast; sculpture will come in for its full share of glory; and the produce of ancient Art, with the achievements of modern genius, will be adequately represented for the honour of the nation.

The gathering will by no means end here; Art-productions of all ages will be contributed. To enumerate the several objects, down to the gems an inch square, that will be sought for and obtained from "collections," would be to fill a volume.

Neither is the Art-industry of our day to be neglected; for all manufacturers who produce works of special grace and beauty, or whose productions are in a high degree meritorious, will be invited to contribute—not, indeed, the ordinary produce of trade, but the extraordinary fruits of extraordinary efforts in Art-manufacture.

Thus, the month of May, 1857, may be looked forward to as of interest second only to that which greeted the May of 1851, and to which the coming event is a most appropriate successor, attempting no rivalry, but pursuing another road to accomplish the same high, and refining, and ennobling principle—the delight and instruction of millions.

We shall from time to time report the proceedings of the committee, to aid and co-operate with whom it will be our duty, as it is the duty of all who have interest in the enlightenment and gratification of a community by the purest and most intellectual sources through which it can be enlightened and gratified.

ROYAL MANCHESTER INSTITUTION.

EXHIBITION OF PICTURES.

THE annual exhibition of modern pictures was opened early in September. It consists of five hundred and fifty works, of which there are a few in sculpture, and several drawings in water-colours. We believe there is no "Society of Artists" in Manchester, and that the periodical exhibitions are the results of the labours of several gentlemen by whom the pictures are collected. This is somewhat strange, and to be regretted. If Birmingham and Liverpool can sustain an institution composed of artists, and that there is an honourable distinction conferred by membership, surely there can be no just reason why Manchester should not be equally thus advantaged. A time is, we hope, at hand when "the coming artist," so to speak, will meet with patronage in this wealthy city—when, at his outset in life, and not at its close, his pictures will find purchasers there; at present, certainly, mediocrity, although it be the mediocrity which gives promise, is not often fostered into excellence by the patrons who in Manchester bestow munificent aid where it is little wanted—

"Giving the sum of more
To that which hath too much."

We presume to hope, and that with some confidence, to find the Stanfields, the Creswicks, the Mulreadys, and the Wards of the future dating their earliest helps on the road to fame and fortune from the day they received their first commissions at Manchester.

The character of the present exhibition, although not altogether good, is not unsatisfactory. The line is occupied by pictures of much excellence. Several of them are old favourites; but some we see here for the first time. These are for the most part the loans of Mr. H. Wallis, a very liberal contributor, or such as have been sent thither from the walls of the Scottish Academy. These are enough to give a character to the exhibition. The names of B. W. Cooke, the Linnells (we may now associate father and son, for the one has become a worthy competitor of the other), S. Cooper, Paed, Harding, Lauder, Creswick, Dobson, Ansdell, will sufficiently guarantee the value of the more prominent parts of the collection. Moreover, it contains "The Charcoal Burners" of Rosa Bonheur, and a work of John Lewis, "Encamping in the East," sufficient to tempt a visitor to enter these rooms with a certainty of recompence.

There is but one picture we are just now enabled to select for special notice; we allude to a work of Mr. F. Leighton, the painter of that marvellous work, which, by exciting so much admiration at the Royal Academy in 1855, led to proportionate disappointment in 1856. The picture here exhibited is "The Reconciliation of the Montagues and Capulets;" the scene takes place over the dead bodies of Romeo and Juliet. Although not an agreeable theme, it has been treated with masterly skill. The faces of the hapless lovers are exquisitely painted. The composition has been carefully and well considered; the drawing is indisputably good; and the work contains ample proof that the accomplished artist's comparative failure at the Academy this year was the result of an unhappy choice of subject, and from no lack of power to redeem the promise he has given to the world.

The exhibition is held in the great rooms of the Institution. There are several fine works in sculpture; among them MacDowell's statue of the lamented Lord Belfast, the "Angelica" of John Bell, Calder Marshall's "Imogen asleep," and the "Egeria" of J. H. Foley, with three exceeding beautiful bas-reliefs by J. M. Miller (one of which, the "Tintania," we have engraved). They are in marble.

But here, as elsewhere, sculpture is treated as an art that needs no help, and requires no encouragement; for the works we have enumerated are thrust aside into a corner of one of the passages, called "a corridor," crowded together without order or arrangement, and treated with as little respect as if they were so many "images" dragged out of an Italian's workshop to be hawked through the city.

Under other circumstances, the exhibition would be more than satisfactory; but, unhappily, it is seen at the same time as the collection at the Mechanics' Institution, and it suffers much by comparison.

THE WELLINGTON MEMORIAL, AT MANCHESTER.

THE monument to the memory of "the Great Duke" was inaugurated on the 30th of August, in the presence of a large number of the magnates of Manchester, headed by Mr. Alderman Barnes, the chairman of the committee. It is happily located—the square in which it stands fronts a graceful building, the Infirmary, and it is "the pendant," so to speak, of the group which commemorates Sir Robert Peel—the work of Calder Marshall, the pedestal of which has been raised some four or five feet in order to harmonise with the companion group, the work of Mr. M. NOBLE. This memorial of the services of Wellington, in peace and in war, is envied, but at reasonable distance, by several palace-warehouses, truly magnificent establishments, out of which issues the wealth that, on the one hand, sustains the hospital, and, on the other, confers honours upon those British worthies whose words and deeds are incitements and examples.

We cannot speak of the work of Mr. Noble as of the highest order; but it is unquestionably entitled to considerable praise, and will certainly add much to his reputation: a far worthier achievement than was generally looked for at his hands, it will reconcile many opponents of the decision which gave to the young sculptor this important task. It is one of the valuable Art-acquisitions of Manchester.

Perhaps, if the work were a model upon which criticism was sought with a view to arbitration, we might be disposed to examine it more closely than we are—now that it is a *fait accompli*, it is useless to inquire whether better might or might not have been done; the work is there, and is entitled to much respect. Those who think that the Duke should have been represented as the soldier, and not as the mere gentleman, riding and not standing, indicative of heroism and not of reflection, may still be disappointed with this work; but they will not regret that their city has added another to the many good works which are designed and calculated to stimulate and to reward.

The Duke stands on a pedestal of granite; at the corners are four colossal figures, representing Wisdom, Valour, Victory, and Peace; there are to be four bas-reliefs, commemorative of his triumphs as a soldier and a statesman. The figures are of massive character, the draperies broad and effective, and the expression of each is in all respects to the purpose. They have been thoughtfully modelled and carefully executed. The figure of the Duke is entirely satisfactory—we believe there is no better likeness of him in his declining years; we may prefer to see his effigy in his prime, but that is matter of opinion. Certainly this will bring him palpably before us as he walked down Piccadilly some four or five years before his death, when his vigour of mind outlived that of his body, and the eagle eye still seemed to gaze upon the laurels he had won in a hundred battle-fields. We fully agree with Mr. Alderman Barnes that in this statue we "recognise his familiar features, and are reminded of that indomitable valour which, ever aided and directed by his extraordinary wisdom, secured for him immortal fame."

The statue was "uncovered" in the presence of a large number of the foremost men of Manchester, in whose presence the sculptor received one of those compliments so seldom bestowed on artists and men of letters—who work usually apart from crowds, and to whom the "voice of the charmer" comes rarely until it can bring with it neither honour nor reward. It is, therefore, not often that we have to record an expression of thanks and approval delivered before a worthy audience in the presence of the artist, who, having done his work, covets the recompence which no mere payment for labour can ever bestow. The Bishop of Manchester addressed the assemblage, and his words were warmly and cordially responded to when he had said—"I ask you to join with me in rendering your tribute of approbation and thanks to him whose artistic skill has enabled us to show you this great, this good, this noble work—this lesson to posterity, that here, among the other eminent men this city delights to honour, we can show what pure virtue, simple greatness and grandeur, unblemished integrity, and military skill, united with civil ability, deserve at the hands of Englishmen. I call upon you to give three cheers for Mr. Matthew Noble!"

THE PUBLICATIONS OF MESSRS. DAY AND SON.*

It is now a considerable time since we have had the opportunity of reviewing the Art-publications of this long established and well-known printing firm; consequently their works have so accumulated on our hands as to justify a separate and distinct notice from our ordinary "review" columns; while the importance of the majority of these publications may be adduced as an additional reason for a departure from our usual course in matters of this kind.

The first work to which we desire to call attention is the republication of D. Roberts's *SKETCHES IN THE HOLY LAND, SYRIA, &c. &c.*, lithographed by Louis Haghe, constituting, from its size, a "library edition." The extraordinary success which attended the first issue of this most interesting publication, when in the hands of Sir F. G. Moon, made it almost certain that at some future time another edition would be circulated to come within the reach of those whose means would not permit the purchase of the earlier and more costly work, which, by the way, is now but rarely to be acquired. When the original proprietor and publisher retired from business, the "Holy Land" passed into the possession of Messrs. Day and Son, who, with as little delay as the circumstances of the case required, commenced preparations for issuing the edition which is now before us. To assure positive identity between the two, the whole of the plates were reduced to the required size by means of photography—a process which has ensured the reproduction of the excellence of the originals, both as regards effect and artistic touch. The result is a work which, save in the advantages of size, whatever such advantages may be, possesses all the beauties of the larger publication. On a careful examination of these volumes, the only difference we can discover is that the plates, two hundred and fifty in number, seem to exhibit even more delicacy and finish of execution than their predecessors; we should scarcely have supposed that the art of lithography could have carried these qualities so far. Of course the historical descriptions, from the pen of Dr. Croly, that accompanied the first issue are printed without abbreviation in the second. The text forms by no means the least valuable portion of the work. No writer of the present day is better fitted for the work he undertook than this eloquent and learned churchman.

Ten or twelve years have, we believe, elapsed since the first publication of the "Holy Land." The public has during this time so well tested and appreciated its artistic and literary worth, as to render it unnecessary for us to do more than announce the completion of a series that deserves to be in the possession of every family which has the means of procuring it, and hundreds may now purchase where tens could not before.

The next publication we have to notice is of a different kind from the preceding; it is, *THE GRAMMAR OF ORNAMENT*, by Owen Jones, the plates, one hundred in number, drawn on stone by F. Bedford. Writing last month about the "Stationery Court" at the Crystal Palace, we mentioned, among other printed works exhibited there, a number of the specimen plates of this "Grammar," which will not be quite completed till the end of the year, some little delay having occurred from the desire of the artists and printers to make it as perfect and beautiful as possible. It was in the first instance estimated that five hundred stones would be sufficient to produce the one hundred plates, at an average of five printings to each stone, but it was subsequently deemed advisable to use seven hundred stones, or seven to each plate, in order to produce the work in an entirely satisfactory manner. These few statistics will do something to enlighten the uninitiated as to the cost and trouble which such artistic productions entail. These hundred plates will contain no fewer than three thousand examples of Ornamental Decoration from various styles, exhibiting the fundamental principles which appear to reign in the composition of ornament of every period and of every nation, commencing with various savage

tribes, and the earliest examples of Egyptian ornament, down to the Italian, the whole being divided or classified into twenty chapters, one to each epoch; but the number of examples varies according to the importance of each style. Thus, Egypt and Greece have each eight plates assigned to them; while for the ornaments of the Arabs and Turks three each are considered sufficient. The descriptive letter-press, from the pen of Mr. Owen Jones, will accompany the last part that is issued. In it the author proposes to define the apparent origin and trace the development of the several styles of ornament, and will then proceed to ascertain the laws that govern their composition—both those which are general to all styles, and those which are peculiar to each.

These plates are of imperial folio size, and they are printed with all the care, accuracy, and brilliancy which the chromo-lithographic art is capable of realising; it would be unjust to all who have a share in producing them were we to refrain from acknowledging the enterprise, skill, and talent that have created so beautiful and useful a publication.

THE SCENERY OF THE CRIMEA, a large folio volume containing fifty-two plates, from sketches by Carlo Bossoli, will lose none of its interest from the fact that, happily, the country is no longer occupied by devastating armies; moreover, the artist shows it to us before the ravages of strife had made it desolate; and thus, by placing his views side by side with the numerous "war-pictures" which have appeared during the last two or three years, we can draw our own comparisons between a country naturally picturesque and often luxuriant, and the same scenery when covered with the footprints of which "Discord, dire sister," leaves upon it. Carlo Bossoli was for a considerable time a resident in the Crimea, in the suite of Prince Woronzoff, hence he had the most favourable opportunities of exploring its beauties, and sketching whatever he desired; his pictures are, we have understood, much esteemed by the Russian nobility. The fifty-two views—we can only speak of them generally—include most of the places which interested us as Englishmen during the war, and which we yet, and generations after us will, associate with so much that is glorious in our national annals, and so much to call forth national and individual regret. There is very considerable artistic merit in these lithographic pictures, which are printed in three colours besides the black, or chalk.

We come, lastly, to three works of a totally dissimilar character to any of the preceding; some of those extraordinary productions which, when we look at them, puzzles the eye to discover whether it is not contemplating the results of the pencil, and not those of the printing-press. The first is a large chromo-lithograph from Haghe's picture, called "The Happy Trio," exhibited, if we recollect rightly, two or three years ago at the New Water-Colour Society; of the numerous "stone-pictures" we have seen, this certainly equals, if it does not surpass, the best in its close imitation of the original; all the accessories are wonderful in their finish and texture, and the light throughout is expressed with the brilliancy and truth of real sunshine penetrating the old windows of the apartment, and reviving the colours of the accessories—ancient damasks, tapestries, coverlets, &c.

DOLLY VARDEN, after Frith's well-known picture, is another chromo-lithograph of marvellous power of colour; the broad and dashing touch of the artist is as closely imitated as it is possible for copyist to do; a coat of varnish and a frame are only required to render it a "genuine original" for any dealer in modern Art.

LAVINIA, after Sant, is the last we have to speak of; more sober in tone than "Dolly Varden," it is not a point behind the latter as a charming picture—such works ought scarcely to be called prints—and as a faithful transcript of the artist's work. Mr. Risdon, who transferred these three subjects to the stone, is entitled to honourable mention for the successful result of his labours.

In conclusion, we may remark that the issue of these respective publications shows that the establishment of Messrs. Day and Sons still maintains the high position it has long held as the producers of artistic works of the best character; many of them got up at a vast expense, entailing a large amount of capital, and manifesting much energy and enterprise on the part of the publishers.

"PIZZARRO," AT THE PRINCESS'S THEATRE.

THE introduction at the Princess's Theatre, during the month just brought to a close, and after an interval of only ten days since "The Winter's Tale" was laid aside, of one more of those remarkable scenic displays which have distinguished the management of the Keans, seems to demand at our hands not only some notice of this last, and, in some respects, most brilliant of all these dramatic illustrations itself, but also a few words of remark on the principles of management which this and the others involve. The mere amount of picture which any one of these extraordinary performances brings into play would alone command, as a matter of right, the comments of a journal devoted to the report of all Art manifestations among the people; but when this picture is raised into dignity by being employed as the vehicle of all the Art archaeologies—when Mr. Kean's allurements of the eye of his audiences is made by him the means of instructing their understanding—when the showiest kind of ornament takes in his hands the character of severe truth, and picture becomes document—and when these representations have succeeded each other in such numbers and with such regularity as to imply system,—we feel called on to do something more than report on the mere fact of a revival,—to take some account also of the value of the system of which it forms a part.

Year after year, since Mr. Kean began this series of illustrated dramas, he has seemed to set up as against himself, in the one year, a test before which in the next he must almost necessarily break down. The success of each revival has made the success of another more difficult. The profusion of illustration in one has become the measure of the illustration below which Mr. Kean must not fall in the following; and the amount of interest which in any particular case he has been able to awaken indicated the craving condition of the public mind which he has had to address in that which succeeded. It is much to say, that the expectation so kept alive and progressive he has never yet disappointed. Constantly competing against himself, he has been a constant winner. Beginning years since at a point which seemed to forbid advance, he has been advancing to this day. Subjecting himself every season to a trial more severe, he every season gets a fresh verdict. Illustrating history of very varied characters,—where the subject immediately in hand will not yield him one sort of triumph, he makes it yield another. His present theme, for instance, and any possible method of its presentation, are wanting in that refined interest which, in his getting up of "The Winter's Tale," ministered to the classic sympathies as on the stage they had never been ministered to before:—and in that piece, we confess, we thought the long-threatened limit to the power of scenic decoration had been reached. The first night of "Pizarro" proved to us that we had underrated the resources of taste and ingenuity. The art which last season was employed to illustrate the splendours over which Art in its palmy days presided, passed at once to the illustration of another magnificence, the absence from which of Art, in its more refined meanings, is revealed with equal power in the light of the art which presents it. From the forms and manners of a luxurious civilisation, Mr. Kean plunges at once into the pageantries of comparatively barbaric wealth; and while, as we have said, the result is one which does not appeal to our most refined and graceful associations, as do the pictures of Greek life shown at the court of Syracuse, out of the rich and ruder materials here at his disposal he has contrived displays of grouping and of colour which throw everything else of the kind that he has done into the shade. It is perfectly wonderful, the art by which all that the imagination of man has been accustomed to consider as symbolic of teeming riches is here introduced to the sense. The marvellous reports of the old Conquistadores, which made of Mexico and Peru vast treasure-houses of all that the Old World had held most precious, are here made probable,—as in those ancient narratives they were only true. The *véro* is shown as *ben trovato*. The moral of El Dorado is made present to the mind with a vividness which leaves Pætolus scarcely a golden legend. The spirit of gold pervades every-

* ROBERTS'S HOLY LAND. Library Edition. 6 vols.—THE GRAMMAR OF ORNAMENT. By OWEN JONES. 100 Plates.—SCENERY AND PLACES OF INTEREST IN THE CRIMEA. By CARLO BOSSOLI.—CHROMOLITHOGRAPHS. Printed and published by W. Day and Sons, Lincoln's Inn Fields.

thing, as at the marriage of Miss Kilmansegge. We are visibly in a land where the mountains are made of gold, where gold is, as the natives say, "the tears wept by the sun," and where all the whirl and excitement of tropic life are made, as it were, to turn on golden wheels. History glows in Mr. Kean's page with the actual life which Pizarro saw, and gleams with the golden ore for which Cortes was a scoundrel. But again we say, the great and peculiar triumph of this piece is in the arrangement of its groups and the massing of its hues. The artist has here presented to him wonderful studies of colour; and the common eye reposes on these rich pronunciations and moving rainbows as it would on huge beds of the brightest flowers. The setting of picture would seem to have reached its perfection in this revival. Nothing so gorgeous, striking, and many-hued was ever put on the stage as Mr. Kean's version of "Pizarro."

It is beside the question here, to institute any inquiry into the causes which have produced the decay amongst us of what is called the legitimate drama:—it is enough that we have to accept it as a fact. The causes, doubtless, are of many kinds; some not easily disentangled from the complex tissue of social and intellectual motive, and some obvious enough,—some, it may be thought, tending to permanency of character, and some, it may well be hoped, which will yield to time. There are playgoers yet living who are able to measure by their own memories all the distance between the condition of the public drama even as lately as the time of the Kembles, and that of its present day,—and who have seen growing around them, without being conscious of the process at the time, or able to find all its threads now, the web of circumstance by which that difference is determined and explained. Amongst many social changes, of custom and of thought, which have been all working to the same result, it may be remarked, that the progress of club life and the spread of literary associations have created a state of things wholly unlike that in which the idler had no resource but the theatre, and the hungerer after intellectual food no lecture-room but the stage. Men who flocked to the theatre once as a place of common resort, for amusement or for education, have since set up institutions of their own where the one or the other may be had, with the greater profit of comparative seclusion, and with something of the ease and dignity of home. The withdrawal from the theatre of any large class of the community, unless it be substituted by another, is practically equivalent to the withdrawal of the whole; because in a country wherein the theatre has no government support, and is maintained as a private speculation, its doors can be kept open at all only on the condition that the public enter them in remunerative numbers. It follows, that the withdrawal, in particular, of that best class who sought the theatre for its teaching—and formed always the sound and thoughtful element which was at the core of dramatic prosperity—involved, as its natural consequence, the death of high drama, even supposing that a public could be found, on some other temptation, to fill their place in the theatre. To lure the idler back from his luxury, then, managers had recourse to the sensualities of Art. The stage where Garrick trod has been surrendered to the genius of mere pageant, and Shakspeare has been dragged at the tails of horses. Before we examine more particularly what Mr. Kean has done under these circumstances, it is right that we should refer here to what he tried first to do; because the value of the good thing which he has achieved can be emphasized only by showing that what would have been a still better thing he had found to be impossible. No one has done more in recent times to test the practicability of that better thing than Mr. Kean; no man fought more perseveringly than he for high drama against the influences by which it had been beset. If Mr. Kean could have made his stage the head-quarters of the legitimate drama, he would have done so. In the early years of his management he did what he could to woo her back. Year after year he gave the public the opportunity of pronouncing for a more wholesome state of things, by the production in each of some new example of the dramatic talent which, in spite of many circumstances of discouragement, we have still amongst us. When the public had sufficiently pronounced its determination not to follow him in

that direction, what did Mr. Kean do? Determined that the stage should, in his hands, be a teacher in some way, he took to teaching the people history in the form of Art. He had, of course, observed the love of picture which was one of the influences fighting against him on his old ground; and that love of picture he determined to turn to the account of something better than itself. He had seen, too, that the thinking class who had abandoned, for the lecture-room, the public arena in which Shakspeare was the great and successful lecturer years ago, were exhibiting signs that their hearts yearned once more to that wise old teacher who taught them as none other can. Driven from his ancient home by their desertion, the great poet was gradually following them, on their own invitation, into the new homes which they had established for themselves. The practice of Shakspeare reading was growing into an approved portion of the courses of amusement and instruction, combined, which most of these institutions arrange for themselves,—and becoming also a popular method of addressing the public elsewhere than within their walls. This seemed to suggest to Mr. Kean a course of action, by which an unwholesome phase of the public mind might be actually seized, and directed to a wholesome issue. To the lover of picture he determined to reintroduce Shakspeare,—while the lover of Shakspeare he tempted back to the theatre by all the ministries of Art. Summoning the archaeologist to his aid, and bringing into his service all the Muses, he has given us a series of Shakspeare revivals which, for completeness of illustration and beauty of presentment, have never been equalled. Marvels of Art-document they are,—illustrations of history such as can nowhere else be seen. They are full of instruction of many kinds:—and it is our hope that the public will take some means of testifying personally to Mr. Kean their approbation of the partial regeneration which he has effected, and the sound direction in which he has led. The matter is even more important than it seems; for we are satisfied that if there be an early way back for the people to the temple of high drama, it is this. That finer and more thoughtful spirit which exhibitions such as Mr. Kean offers, tend to cultivate, are means of popular redemption from vulgar taste and unintellectual pursuit. They help to beget the habits of mind on which only can grow the worship of that highest of intellectual inspirations, the dramatic Muse. Accustom men to look for meanings even in what appeals directly to the sense,—and they will end by aiming at the highest meanings of all. Mr. Kean is leading his audiences back to the temple, and at once amusing and instructing them by the way.

Not, however, confining his historic illustrations to the creations of our great dramatist alone, Mr. Kean has resuscitated for the playgoers of London the extinct races of Assyria, on the authority of documents that had themselves been buried for thousands of years:—and he now brings before us a people who in the quaint and picturesque strangeness of their manners and institutions seem almost as far removed from ourselves as the ancient Assyrians do, though disinterred as a living race for Europe only three centuries ago.—"When," says Mr. Prescott, "the Europeans first touched the shores of America, it was as if they had lighted on another planet,—everything there was so different from what they had before seen. They were introduced to new varieties of plants, and to unknown races of animals; while man, the lord of all, was equally strange, in complexion, language, and institutions. It was what they emphatically called it, a NEW WORLD. Taught by their faith to derive all created beings from one source, they felt a natural perplexity as to the manner in which these distant and insulated regions could have obtained their inhabitants. The same curiosity was felt by their countrymen at home, and European scholars bewildered their brains with speculations on the best way of solving this interesting problem."—Of a play so well known as "Pizarro" it is no part of our present purpose to speak critically, save to say, that it presented itself naturally to Mr. Kean in his search through the drama for the means of opening up "a fresh chapter in the pages of the past." It gave him at once a striking variety, and a subject for abundant illustration. It took him to a land where, as he says himself, "while nature appeared to revel

in her grandest and most picturesque aspect, the land abounded with precious gems and metals to such an extent, that, amidst the gardens of temples and palaces, trees and plants of gold and silver, most exquisitely manufactured, stood intermingled with natural productions." It took him among a people whose monarch ruled them from a chair of gold. All this, and infinitely more, in the way of magnificence and detail, Mr. Kean has rendered. As usual, he has taken such liberties with the text as suited his purpose of historical adaptation; but, for the most part, the alterations are unimportant as regards the text itself, with the exception of that which omits the death of Pizarro as an incumbrance on the unity of action. But this incident Mr. Kean must in any case have dispensed with, on his principle of making his dramatic representations, where he can, conform to the facts of history.

The charm of completeness which Mr. Kean has carried into the getting up of this piece, he has contrived also to attach to its performance. The play is thoroughly well acted throughout; and nothing occurred, even on the first night, to disturb the sentiment of the action, or clash with the perfection of the illustration. It may be observed, that melodrama—which "Pizarro" unquestionably is—lends itself well to the highly-coloured and picturesque species of illustration which Mr. Kean had to employ on the ground chosen,—and that the somewhat stilted virtue and sententious dialogue of Kotzebue's play have a pleasing appropriateness where everything that is hung around it in the way of picture or archaeological comment is so pronounced and emphatic. The principal parts, male and female, are, of course, sustained by Mr. and Mrs. Kean,—and so sustained as to give the finish to the whole which must come (if it be attained at all) out of them. To the part of Rolla full effect is given by Mr. Kean; while he renders it without exaggeration,—a fault to which it tempts. The part of Elvira, in Mrs. Kean's rendering, gets colour from an originality of her own. On the early refinement and passionate nature of the companion of Pizarro she has grafted a touch of brusqueness, and of that ruder manner which belongs to her exceptional position and her long camp following.—Nor would it be just, that we should close this notice without a word of warm commendation to the music. Nothing could well be more characteristic, or more in harmony with the other accidents of the representation. The Indian airs are said to be founded on melodies published in Rivero and Tschudi's work on Peruvian antiquities, as handed down by the Spaniards after the conquest; but the merit implied in the manner of their use is the composer's own,—and the original music accompanying the more impressive situations is, at once, distinguished for intrinsic beauty, and marked with local colour. Mr. Hatton's is an important contribution to the completeness of this rich and striking whole.

ART IN THE PROVINCES.

GLASGOW.—Mr. James Ballantine, of Edinburgh, the distinguished artist in glass-painting, who executed the decorated windows in the House of Lords, has, at the request of the Lord Provost of Glasgow, submitted to him, as the head of the corporation, a complete plan for ornamenting with stained glass the windows of the Cathedral of Glasgow. The subjects he has selected for the four principal windows are, with the exception of those for the large east window, from the New Testament. The whole series of designs are the following:—*Large West Window*:—"Christ's Entry into Jerusalem;" "The Last Supper;" "The Crucifixion;" and "The Ascension," or "The Life of Christ," illustrated in a series of medallions. *Large South Transept Window*:—"The Transfiguration;" "The Expulsion from the Temple;" the four lateral upright lights to be filled with architectural ornamentation, similar in character to the opposite window, the *Large North Transept Window*, the designs for which are—"St. John Preaching in the Wilderness;" "Christ Preaching on the Mount;" "The Day of Pentecost;" "The Angels opening the Prison Doors for the Apostles." For the *Large East Window*, effigies of the twelve Apostles and heads of twelve Prophets, in medallions, with geometric and foliated adjuncts. Mr. Ballantine proposes that the entire series should be executed under the superintendence of one artist, that unity of purpose and harmony of connection may be attained.

THE WELLINGTON MONUMENT.

IN an early part of our Journal for the present month, we have given a somewhat lengthened exposition of the views entertained strongly by ourselves and others as to the principles which ought to control the distribution of the Government Commissions for the execution of national works of Art; and much of that exposition had direct reference to the great intended monument whose title we place at the head of the present article. Since those remarks were written, an announcement has issued from the office of works, to the effect, that, "it is the intention of Her Majesty's Government to erect a monument in St. Paul's Cathedral to the memory of the late Duke of Wellington, and that they are prepared to receive designs for the same from artists of all countries." Each competitor is required to state the sum for which he will be prepared to execute his model, if called on to do so,—and the maximum price is fixed at £20,000 sterling. The monument is to be made "of marble, stone, bronze, or granite, or any of these materials combined;" and the models are to be sent in, in June, 1857. They are to be delivered at Westminster Hall, or some other place to be hereafter determined,—and which is to be a place of public exhibition for them in July of the same year. The instructions to artists are accompanied by a ground plan and elevation of the site on which it is proposed that the monument shall stand, and a perspective view of the arch under which it is to be erected. Nine premiums are announced to be given for the nine most approved designs:—one of £700, one of £500, one of £300, one of £200, and five of £100 each:—the models to which premiums are awarded, to remain the property of the Government;—and it being, of course, provided, that the artist to whom the highest premium shall be assigned will not be entitled to receive it in case he shall be employed to execute his design.

They who have taken the trouble to follow our remarks on this subject elsewhere, will see, that there is much in all this of which we should approve, were it not contradicted by other clauses which have our strong disapprobation,—and were we not for the present compelled to take objection to the whole. The provision for a set of premiums, and that for public exhibition, and the communication of particulars respecting the site, are among the points which we have urged most strongly in the recommendations on the subject which we have ventured to offer in our present publication. But,—to begin with our general objection,—we see in Sir Benjamin Hall's action in this matter, warned as we are by what has already occurred on the subject of this monument, a disposition to override his commission, which we greatly distrust. No parliamentary appropriation has yet been made of the surplus fund out of which Sir Benjamin Hall proposes to pay for this work; and he can scarcely show sufficient authority for his summary dealing with a matter which, at once, disposes absolutely of a very large sum, and solves arbitrarily very important principles. A work so significant as this Wellington Monument, and involving so many points for consideration, has a right to the protection of Parliament.

The clause which provides for a public exhibition of the competing models, gives no hint as to the kind of tribunal by which that competition is to be decided; but rather leaves us to infer,—from the direction given, that models are to be addressed "to the First Commissioner," and, from the First Commissioner's previous attitude in the matter,—that Sir Benjamin Hall considers, that he himself is that tribunal. Sir Benjamin may be assured, as we have argued elsewhere, that he will fail entirely to give satisfaction to either the public or the profession, unless a court shall be established for adjudicating on this competition, learned enough to escape all suspicion of a mistake, and numerous enough to soar above all suspicion of private influence. In matters of Art, we have a strong notion that even a First Commissioner of Public Works will be the better for assessors.

But what we most strenuously object to in this ministerial announcement, is, the clause which for this great work of national Art calls in the competition of the foreign artist. With so many sculptors of eminence at home needing commissions, why

is it, when we have a valuable commission to give, that we look abroad? For the life of us, we cannot understand either the necessity or the policy of going to the foreigner in the matter. Why can we not do our own work with our own hands? The principle which lets in the foreigner in such a case has not even reciprocity to recommend it. This doctrine of international free-trade can have no fit application in matters of Art. The logic of free-trade is, that it cheapens whatever it addresses itself to:—and we presume, that even Sir Benjamin Hall will not avow that his object in this matter has been to cheapen the Art. The thing wanted is excellence; and excellence we have—and of the first order—amongst ourselves. The argument against sharing our commissions for the execution of public works of Art with foreign artists, we have stated at length in the article to which we have already alluded (page 293):—and we earnestly solicit Sir Benjamin Hall's attention to it. Perhaps Sir Benjamin may be disposed, on reconsideration, to recall this portion of his instructions ere it be too late. If not, parliament *must* at length take up the cause of the British sculptor:—and we believe, a parliamentary opinion on the question at issue will be taken next session.

We object, too, to the site chosen for the work:—and on more grounds than one. Placed in St. Paul's, a monument which should have a strong mark and significance of its own falls into the mere category of works that make the decoration of a temple. The only fitting place for such a monument in St. Paul's, if in St. Paul's it *must* be, is the centre of the floor, beneath the dome. But while the crowd of works of Art that surround St. Paul's are, as we have said, mere decorations of a temple,—they are, in our opinion, inappropriate decorations of a Christian temple; and we had hoped the time had come when it was understood that two distinct ideas are thus brought together having no inter-relation, and so, weakening one another. We hope to see the day when England will have a Prytanæum of her own, within whose walls—for, a London Prytanæum would probably require to be an interior—the memory and monuments of her illustrious dead may create their own special sanctity:—but meanwhile, for this particular monument the site which we have pointed out elsewhere is emphatically the true site. If not, there are others in the metropolis far more appropriate for the purpose than St. Paul's.

MINOR TOPICS OF THE MONTH.

THE "COLDSTREAMS" MONUMENT.—An early instalment of that great body of monumental commemoration which, in all probability, will, ere very many months be past, write the legend of the sorrow that the recent war has bequeathed in most of the cathedrals and churches of England, has already set up its sad record in the chief of them all—our great metropolitan cathedral of St. Paul's. The monument in question is erected in the south aisle of the vast nave, not far from the great western gate; and is the work of that most petted of sculptors, the Baron Marochetti. It has a rich burden in the names of eight gallant officers of the Coldstream Guards, who fell fighting side by side on the fatal day of Inkerman, and found a common grave in the far Crimean solitude:—"Brothers," says the inscription, "in arms, in glory, and in death." The record says, that it is, "Sacred to the Memory of Lieutenant-colonel the Honourable T. Vesey Dawson, Lieutenant-colonel J. C. Murray Cowell, Captain Lionel D. Mackinnon, Captain the Honourable Grauville C. C. Elliot, Captain Henry M. Bouverie, Captain Frederick H. Ramsden, Lieutenant Edward Adisbrowe, and Lieutenant C. Herbert Greville." Notwithstanding some touching aid from the surviving comrades of the gallant dead, we cannot say that the Baron Marochetti has set to a very fine chord the key-note of that dirge music which the multitudinous graves of the Crimea have to wring from the Sculpture Muse. Some better utterance might fairly be expected than this of the great grief that flings over ten thousand English hearts to-day the shadow of Cathcart's Hill. A pathos there doubtless is speaking from this marble memorial—but it consists mainly in the written inscriptions, and the facts which they reveal.

The chisel of the Baron contributes, we must say, little to the sentiment with which we look on this mournful record. With such eloquent materials in his hands, it is impossible to resist the conviction that Baron Marochetti has contrived to be more than reasonably commonplace. The sculptor has done so little here, that we wonder *they* who are content with it should have thought it necessary to go beyond the statuary for the work. The mere marble-yard would have furnished just some such model with such means. The Baron has reposed mainly on matter of fact; and though it is true that the real pathos in cases of monumental record in general does lie in the matter of fact—and that it does so certainly in this,—yet, when sculpture undertakes its expression, we expect that her utterance shall be more spiritual. Let our readers judge. A white marble tablet bears in full the names of the eight "brothers in arms, in glory, and in death." Over the tablet there is a small sculptured representation of the tomb, with its inscription (giving, thus, the names again), raised above their common place of rest beyond the Euxine; and the circular top of the plane on which this presentment rests is bordered by a wreath twisted of the leaves of that exceedingly well-known and much used tree, whole groves of which are growing in the marble-yards and grave-grounds of London and elsewhere—the laurel. This is the symbolic part of the work—secure in its prescription: over it comes another *fact*, the star of the military order, and the motto, "Nulli secundus." Above this, again, is the legend, supplied by the Dean of the cathedral—"And the victory that day was turned into mourning:"—and over all wave the colours of the regiment, with this record, "These Colours belonged to the Coldstream Regiment of Foot Guards, and were presented by Colonel the Honourable George Upton, C.B., and the Officers of the Regiment, with the sanction of Field-marshal the Earl of Stratford, G.C.B., Colonel of the Regiment, as a tribute to the gallant and devoted conduct of their Comrades who fell at the Battle of Inkerman, and whose names are recorded on this cenotaph." This is the most touching incident of the monument, save only the names on the memorial slab; and it is the well-devised contribution of those who were companions of the dead in that terrible field, and are mourners over them here. The poetry of the piece lies in this episode, and it is not written with the chisel. On either side of the tablet which bears the names of the dead bends a sorrowing soldier of the regiment, in the uniform of his corps, and with arms reversed; and in these figures only has the Baron Marochetti made the slightest attempt, so far as this monument is concerned, to write himself sculptor. The characters in which he does so are, however, of no great mark. The relief is low, and becomes so flat at the inferior extremities as, aided by the poverty of expression with which the limbs are in that part made out, to suggest the notion of figures cut out of card. The modelling here is of the poorest kind. The upper portions of these sentries by the tomb are far better. Above, the forms are well defined, and in the faces the sentiment of the place and purpose is successfully conveyed.—On the whole, however, we repeat, we may reasonably hope for far higher strains than this from the Sculpture Muse, for the sleepers on Cathcart's Hill, and in the valleys of dry bones that lie everywhere around it.

THE ROYAL ACADEMY AND ART-TEACHERS.—A correspondent throws out a good hint for the consideration of the Royal Academy in any future alteration in its constitution and government. It is suggested that much service would be rendered to educational Art if the Academy granted to artists who have been educated in its schools, and approved of,—as well as to others willing to subject themselves to examination,—a certificate or title, that should prove them competent to undertake the office of teacher, just as the College of Preceptors does. There cannot be a doubt that, if this were done, it would greatly tend to elevate the class of "drawing-masters" throughout the country, and would also raise their standing in the staff of those employed in general education. At present, the connection of drawing with education,—especially as regards the middle and higher classes,—is far from being rightly understood.

THE CITY MONUMENT TO WELLINGTON is in progress at Guildhall, where the accomplished sculptor, John Bell, is superintending its erection. The

statue of Alderman Beckford, which forms one of the proudest memorials of London city, has been removed—but only to a short distance—in order that the monument to the Duke may companion that to Nelson, so that the two may occupy the two compartments at the sides of the entrance to the council chamber. We shall next month be enabled to notice this work in detail.

THE ART-MANUFACTURE ASSOCIATION.—We have to report on this subject that probably an exhibition of objects of Art-manufacture will be held—first at Edinburgh—in December next. The project has been generally well received—so well that we believe an ample subscription is obtained for a satisfactory commencement. The committee is carefully constructed, although apparently somewhat too national—to be accounted for on the ground that the origin of the society is exclusively Scottish. Mr. Christie has, we understand, visited Paris, in order to “select” some fine examples of French workmanship. Our report must be somewhat qualified until we have larger experience of the projects and plans of the society, which, however, we are well disposed to assist, as promising to be a valuable auxiliary in the progress of taste, and a probable reward to the able designer and skilful artisan.

PORTRAITS AT OXFORD.—The beautiful hall of Christ Church, Oxford, is undergoing repair—gas-pipes are being laid, the floor is partly taken up, and the ceiling is about to be opened: consequently, the dust and lime form a sort of atmosphere, yet, strange to say, the valuable and interesting portraits by Vandyke, Hogarth, Reynolds, Gainsborough, Lawrence, &c., remain upon the walls without the slightest covering, and without the least effort to preserve them from the injuries to which they are exposed, and which they will be sure to suffer! This is altogether unpardonable. We know not who is responsible, but he should be made to answer for his crime to the university and to the country.

THE LONDON STEREOSCOPIC COMPANY, whose valuable establishment in Cheapside we have heretofore brought under the notice of our readers, have recently issued a series of coloured photographic slides, representing several of the most effective groups in “The Winter’s Tale,” as placed upon the stage by Mr. Charles Kean. The subjects are highly interesting; and by this process the most attractive points of the drama are preserved with admirable effect. The groups were of course taken “from the life.” The principal persons of the play were posed for the purpose, and the result has been a new and very gratifying source of pleasure from the efforts of Mr. Kean at the Princess’s Theatre. This important company has done much, and in the best possible way, to render the stereoscope a source of universal instruction and enjoyment. All the works they issue are good; where any are defective they are rejected. Confidence has thus been established; and from their enormously large store of views, figures, groups, and incidents, nearly every city and town of the kingdom now obtains a supply.

THE PEACE TROPHY AT SYDENHAM.—This blot is about to be removed from the Crystal Palace, and we believe there are few who will hesitate to exclaim, “Good riddance of bad rubbish!” It has been a very expensive mistake, but the Directors have done wisely in removing so grievous a record of so obvious an error.

THE PICTURE-DEALER “HART.”—The picture-dealer Louis Hart, whose name will be familiar to our readers as the person who brought an action for libel against the *Art-Journal*, died at Manchester about two months ago. “*Nil nisi!*” His trade in old masters preceded him to the tomb: no one thinks of buying, and consequently no one proposes to sell, now-a-days, a “veritable Titian,” or even an “authenticated Rubens,” in the manufacturing districts.

THE RESTORATION OF SIR JAMES THORNHILL’S WORKS IN ST. PAUL’S.—The reproduction of Sir James Thornhill’s pictures from the life of St. Paul, in the cupola of St. Paul’s, has been effected by Mr. Paris after a long term of arduous labour. There remains yet a portion of the scaffolding, at which we look up from the floor of the expansive area below, and wonder not only how the wooden structure was raised to that giddy elevation, but also how it is sustained there; and contemplating such a lofty suspension, there is little question of what would have been the fate of Thornhill, had his friend

not hit upon the expedient of smearing a favourite feature of his work at the moment that he was about to back off the edge of the scaffold. Mr. Paris has very efficiently discharged the duty confided to him; we can recognise the Apostle before Agrippa, the Conversion, and the Sacrifice at Lystra—all of which, and not only these, but the other five subjects, were entirely veiled by the atmospheric deposit of nearly a century and a half. The subjects are eight in number, consisting of—in addition to those already mentioned—Elymas the Sorcerer, the Conversion of the Jailor at Philippi, Preaching at Rome, and his shipwreck at Malta. The works have been restored in the same colour in which they were originally painted—not precisely *grau in grau*, but in warm tones, so as to resemble drawings in sepia. The pictures come out now with as much force as ever they did, and the highest praise is due to Mr. Paris for his enterprise; but when the spectator looks up at these compositions, he is struck with surprise that these, or any other pictures, should be placed so that either they cannot be seen at all, or seen with great difficulty. If, however, such a “bad eminence” has its disadvantages, it has also its recommendations; for if the beauties of works of Art so far removed from the eye cannot be seen, it is certain that their imperfections are equally secure from observation. With the similar examples that we find at Rome, Parma, and other places, we have nothing to do—it is at all times an act of weakness to follow a bad example. Had these works decorated the nave and transept, they would have been visible and interesting; it would have been quite enough to have broken the interior of the cupola with any bold ornament—had it been coffered and the groins gilt there are greater anomalies in architecture than this. But, moreover, St. Paul’s is the worst lighted cathedral in Europe; we take not in comparison, cathedrals and churches at Rouen, Antwerp, Nuremberg, and other places where the light is immediately obstructed by houses—the principal windows in St. Paul’s are entirely clear of obstruction, but they are too small, too plain, too few, too severely square. We cannot help feeling that there are windows in the building, but when we look for them they seem but temporary—simply oblong apertures intended to assist the workmen in finishing the interior. There are in reality but four windows by which the breadth of the interior is lighted, if we may so speak of the prevalent twilight, and these are over the four doors; and when the doors, that are usually open in summer, are closed, the extremities in which they are placed are in darkness. With respect to the lighting of the works that have just been restored, since they are there, it is worth considering how they might be shown—an improvement which might be effected at a comparatively small expense. The windows below the cupola are numerous, but they are glazed with small panes, and the frames are so heavy as to obstruct perhaps a fourth of the light that such windows should give were the panes larger and the frames thinner. A little improvement in these windows would give a fourth more light, and by means of concealed reflectors the whole of the detail would be fully shown from the whispering gallery: but under any circumstances it is a mere absurdity to remove works of Art so far from the eye. There is no edifice of its class with so few internal attractions as St. Paul’s. This was painfully felt by Reynolds and other contemporary artists when they offered gratuitously to embellish it—a proposal which was negatived by Cornwallis, Archbishop of Canterbury, and Tarriek, Bishop of London. The small square windows are not at all adapted for such an edifice, they should be enlarged and filled with painted glass; and instead of bad sculpture the panels should be appropriated to good painting. The sumptuous adornments of our Houses of Parliament will reduce to meanness every other of our unadorned interiors.

BELGIAN SCULPTURE.—A large accession of sculptured works has recently been made to the collection in the Crystal Palace: they consist of more than one hundred of the original models of the statues executed by the late Charles Geerts, professor at the Academy of Louvain, for the Hotel de Ville in that city, and of the statuettes of saints erected in the Cathedral of Antwerp. These works are contributed by Madame Geerts, widow of the sculptor: they form a very pleasing addition to the sculpture exhibition at Sydenham.

REVIEWS.

DESCRIPTIVE CATALOGUE OF A CABINET OF ROMAN FAMILY COINS BELONGING TO HIS GRACE THE DUKE OF NORTHUMBERLAND. By REAR-ADMIRAL W. H. SMYTH, &c. &c. Printed for private circulation.

Coins, as verifiers of ancient history, are now so universally esteemed that the excuses once timidly made by those who collected them, in defence of their taste, are no longer needed. Since the days of the poet Addison, whose classic tastes led him to their study, and whose graceful pen recorded their interest and historic value, they have been accorded their due place as important aids to the knowledge of past ages, assisting the historian very frequently to minute facts unrecorded elsewhere; for we must always bear in mind that the Roman series of coins was not, like the modern currency, merely stamped to give legal and mercantile value to the metal—“the image and superscription” was not only that of Caesar, but it also recorded some important act of his reign. The money of the Romans is thus a currency and a medallic comment on their history, shadowing forth their acts, their wars, their triumphs, their home and foreign policy, by the aid of apposite emblems or more positive pictures; and all this with an epigrammatic force admirable in its conception and terseness. Truly then does our author assure us that such “infallible vouchers” assist us to “a clear understanding of many customs, offices, and historic events;” and he properly thinks “no one can be disparaged by a pursuit which engaged the attention of, and enrolled among its votaries such men as Alfred, Cromwell, Napoleon, Selden, Wren, Canova, Camden, Evelyn, and Chantrey.” This list of names might be swelled without trouble; and there are few among the educated who will not own, with our author, that “he who can examine them without thinking gravely, has the misfortune to be deficient of a very gratifying sense.” Admiral Smyth is already favourably known by his volume on Roman large brass coins, printed at Bedford some years ago. All who read the book were agreeably surprised by the amount of quiet humour employed to season its profound scholarship. It is so frequently the fault of the antiquary to be heavy, that dulness is looked on by many as an essential peculiarity. The author dealt in this instance with a subject apparently dry, but brought into his pages so much geniality, such a happy method of describing persons and events, and so true an appreciation of the minutest trait which would give life to a dull catalogue, that his book was a history of Rome and its rulers far more amusing and instructive than the duller pages of the historian. Unfortunately his present book is “privately printed,” but we believe that the liberality of the Duke of Northumberland will make it sufficiently public in our libraries and institutions. We congratulate his Grace as much in having such a work prepared as in possessing such a collection. He is indeed fortunate in securing the aid of Admiral Smyth, whose book is not only a catalogue of a valuable cabinet of coins, but an admirable addition to our numismatic literature. The author amusingly illustrates the objections made by the ordinary world to spending money on high-priced coins, that “can hardly be worth sixpence,” by comparing them to those who would “decry a valuable painting on discovering that it was on a shilling’s worth of canvas.” But he also shows that a really good and useful series may be formed of good coins at a moderate rate. Of course extreme rarities, or uncommon types, will always command a *prix de luxe*; yet when we know that genuine and interesting coins may be had from one to three shillings each, and that they fix upon the mind historic personages and events more forcibly than the pages of a school history, we sometimes think that their utility in an educational point of view has not been yet duly considered.

The collection here described was formed by the present Duke of Northumberland many years ago, when, as Lord Prudhoe, he was familiarly known as an earnest explorer in the Levant, forming there a fine collection of antiquities now safely deposited at Alnwick Castle. Yet it was not as a selfish collector that he was known, but as a liberal student of science, and the preface of this book records the facility with which he parted with his gatherings to aid the good general cause. The present volume may be safely considered as an addition to the same liberality; for it enables the student to enjoy this collection of coins equally with its owner; and whatever accident may happen to it in future years, as long as a copy of this book exists, so long will the collection remain intact for general use and instruction. Admiral Smyth’s labours have also invested it with a value which we believe few other scholars could give. We hope yet to see an edition that may be accessible to all.

BLAIR'S CHRONOLOGICAL TABLES, revised and enlarged. By J. WILLOUGHBY ROSSE. Published by H. G. BOHN, London.

In glancing over a catalogue of the works reprinted and published by Mr. Bohn we are surprised at the multiplicity of books it contains, and the variety of subjects it includes. He is unquestionably a publisher of no ordinary enterprise, and what is more to the purpose, a man of no common judgment, knowledge, and ability, in selecting the best writings of the best authors—in placing them, as we almost invariably find he does, in the hands of the most able editors for revision and comment, while he not unfrequently supplies the latter with notes and suggestions of exceeding value. It is a wonder with so much business matter to occupy his attention he can find time for the exercise of his thoughts and pen upon what is peculiarly the duty of the compiler or editor; but so it is, and it is quite evident the reading public are considerable gainers thereby. We do not by these remarks intend, or desire, to detract anything from the labours of Mr. Rosse in the production of this new and greatly enlarged edition of Blair's Chronological Tables; but as he very properly acknowledges that the plan and arrangements of his work are due to the publisher, the latter is entitled to whatever merit, and it is not a little, attaches to the system adopted. But even with the plan laid down for him, the task of the editor, in reconciling the differences of previous chronologists, and in determining dates with the nearest approach to accuracy, must have been one of great labour and magnitude; and there seems to be little doubt of his having accomplished it satisfactorily: to determine this, however, the reviewer would necessarily have to pass through the same ordeal of research and comparison as Mr. Rosse. The table of events is brought down to a date as recent as the execution of Palmer, at Stafford. The volume forms a "Double Number" of "Bohn's Scientific Library;" it is to be followed by another of equal dimensions—nearly eight hundred closely-printed pages—to be entitled a "Complete Index of Dates."

A KEY TO THE PROPORTIONS OF THE PARTHENON. By JOSEPH JOPLING, Architect. Published by the AUTHOR, Bridge Road, St. John's Wood.

We confess that our knowledge of geometry as applied to the principles of Greek architecture does not enable us to pronounce an opinion upon Mr. Jopling's pamphlet; the object of which seems to us to be to prove, by mathematical calculations, the accuracy of the work of the ancient Greeks, as well as of the measurements which Mr. Penrose has made of the Parthenon. But we can only direct the attention of those whom the subject more immediately concerns to the publication before us. Mr. Jopling is under the impression that the teachers of practical geometry are, in our day, all wrong—that they are comparatively ignorant of the "truths of form." He is desirous of inducing a systematic and most extensive and comprehensive practical advance in the knowledge and varieties of true form and proportions applicable to Art, and would like to see a "Gallery of Geometrical Models" in our new National Gallery, or some other appropriate locality, in which "some of the laws by which the Greeks proceeded" might be set out full-size for general instruction. We presume, however desirable this may appear to be, there is little probability of its being carried out.

ANNOTATED EDITION OF THE ENGLISH POETS. By ROBERT BELL. Published by J. W. PARKER & SON, London.

Such a work as this had almost become a desideratum to the literary necessities of the present time; for though some of our English poets have found able editors and commentators, no complete series has hitherto been issued, nor even an edition of an individual poet which, combining careful and truthful revision, typographical excellence, and low cost, would meet the requirements of the day: there seems now to be the fairest prospect of such a want being well supplied. The task could not have been confided to a more competent editor than Mr. Bell, whose "Lives of the English Poets" has become a standard book of biographical reference. The volumes now on our table are, eight containing the works of Chaucer; one of "Early Ballads," illustrative of history, traditions, and customs; and one of the poems of Ben Jonson. Dryden, the Earl of Surrey, Cowper, Sir Thomas Wyatt, Oldham, Edmund Waller, Shakspeare, Thomson—we name them without reference to their chronological order, or to the position each occupies in literature—have also appeared; but we shall now only advert to those immediately before us. It must be self-evident that to present anything like a truthful and correct copy of the writings of

these early poets—one which may be presumed to be free from the corruptions and speculations of careless and incompetent editors—would be a task involving an immense amount of research, industry, and labour. Mr. Bell has adopted, as the basis of the text of Chaucer's poems, the Harleian MS. in the British Museum, selected by Mr. Wright in his edition of Chaucer, which has hitherto been generally accepted as the only safe interpretation of the writings of the poet; but he has collated the text of Wright with that of Tyrhitt, published about the middle of the last century, and has adopted the reading of the latter when it seems to bear evidence of authenticity, and has also introduced his own version of such portions of the original MS. where it appears desirable to employ it; but all deviations from Mr. Wright's version, or from the original, are pointed out in the foot-notes "for the ultimate satisfaction of the reader." Even the most cursory glance at these foot-notes will convince the reader of the diligence, pains, and research the editor has shown to reconcile apparent inconsistencies in the remarks of previous commentators, and to explain what is dark or unintelligible to those unacquainted with the phraseology of the early English writers. An ample glossary of obsolete words, and of words the meaning of which, as introduced, is somewhat obscure, is appended to the concluding volume; it will materially assist the reader in mastering the difficulties of understanding the "Father of the English poets," while it will enable him the better to appreciate his beauties. A general "Introduction" to the writings of Chaucer, reviewing his style and peculiarities, and a particular "Introduction" to each respective "Tale," form valuable "arguments" to the poems. The poetry of Ben Jonson, and the "Ballads," are edited in a like spirit of care and research, and that is all it seems necessary we should say concerning them. The publication of the entire series is so arranged that the writings of each poet form a separate and distinct issue: and as cheapness is now regarded as a necessity in reprinted books, these are sold at half-a-crown each volume.

CHROMOLITHOGRAPHIES. Printed and published by G. ROWNEY & CO., London.

The rapidity with which the printing-press is now sending forth the productions of the chromolithographic process is such that we can scarcely keep pace with the movement: in truth, these coloured prints seem now-a-days to be occupying the windows of the printseller, almost to the entire exclusion of the works of the engraver. We have no fear however for the latter, inasmuch as there is ample room for both, and each will maintain its own position, and receive its share of public patronage, according to the taste of the purchaser. The publications of Messrs. Rowney & Co., now before us, are—"A Sketch of St. Paul's from the Shot Tower," from an engraving by G. Dodgson: the view—a "bird's-eye" one—is taken from the Surrey side of the Thames, a portion of Blackfriars Bridge crossing the foreground of the picture: it is a clever facsimile of the original, but the church-tower on the right is very much too dark, and obtrudes itself on the eye far too prominently. "Notre-Dame, Rouen," after E. Doby, is a highly-finished work; the architecture of the fine old cathedral is very carefully drawn and tinted; the part of the street which is in shadow is coloured rather too heavily. "Whitby, Yorkshire," a small subject after C. Bentley, is an excellent copy of this artist's style of work, who delighted in strong contrasts of light and shade: it is a sunny little bit. "Ruins at Newtown, County Meath," after H. Gasteneau, is another small landscape which we may call "pretty;" but the gem of the whole is in our opinion the "Gipsies' Camp, Claygate, Surrey," from a drawing by R. P. Noble; it is small, but remarkably rich and truthful in colour, and as close a copy of a drawing as if it were entirely executed with the pencil.

NOLAN'S ILLUSTRATED HISTORY OF THE WAR. Part 19. Published by VIKTUE & CO., London.

Though this work reaches us regularly in its monthly issues, we have not noticed it for some time past, and do so now only to observe that the interest of the subject is not permitted to diminish. The last chapter in the present part brings down the events of the war to the correspondence between Sir F. Williams and Lord Stratford de Redcliffe. The intermediate history is ably and fully discussed, and in a spirit of entire impartiality; nothing seems to be omitted which, even in the remotest degree, is connected with this short but sanguinary war: we read the record with mingled feelings of admiration and disquietude.

THE SALAMANDRINE.—SONGS FOR MUSIC.—BALLADS AND LYRICAL POEMS. By CHARLES MACKAY, author of "The Lump of Gold," &c. Published by G. Routledge & Co., London.

Dr. Mackay is among the first of the lyric poets of our day; his verse is always fresh, and healthy, and natural, while it is distinguished by a gracefulness of expression that bespeaks a cultivated intelligence, and by a high moral tone indicative of a right understanding. He teaches by the precepts, and charms by the melody, of his muse; though we have occasionally thought that in some of his writings may be traced the inclination to elevate one class of the community at the expense of another, a rather strong bias in favour of extreme liberal opinions; still his writings generally are calculated to be of good service, and we are therefore glad to see them issued in so cheap a form as to come within the reach of almost everybody. The three little volumes, whose titles are given above, are published at one shilling each. The "Salamandrine," and many of the poems contained in the other two volumes, have passed under our notice before: we have only to recommend them again to the perusal of those who, in this unpoetical age, have happily not lost their relish for "pure thoughts in measured rhyme."

JAUFREY THE KNIGHT AND THE FAIR BRUNISSENDE. A Tale of the Times of King Arthur. Translated from the French version of MARY LAFON. By ALFRED ELWES. Illustrated with Engravings by G. DORÉ. Published by ADDEX and Co., London.

We learn from the preface to the French version of this romantic story, that it is one out of the mine of literary "jewels," which for six hundred years have been buried in the catacombs of the libraries and archives of France. Dragged from the dust beneath which it has lain for so long a period, it is now translated for the first time, and given to the world. The romance was originally written in verse in the Provençal tongue of the twelfth century; begun by a troubadour who heard the story related before Pedro III., King of Aragon, "by a stranger-knight of kin to Arthur and Sir Gawain," and finished by a poet whose modesty caused him to conceal his own name, and that of his colleagues. The Imperial Library of Paris possesses two manuscript copies of this story, which will assuredly find favour with all who delight in the early romantic history of Britain, especially in the deeds of the bold knights who sat at the Round Table of King Arthur. Jaufré is one of the most renowned of these specimens of most ancient chivalry: confiding in the justice of the cause, and in the strength of his right arm, he wages war against giants and wizards and enchantments; rescuing captive lords and beautiful ladies from all kinds of bonds and servitude; receiving, of course, the hand of the "Fair Brunissende," and all her broad acres, as the guerdon of his valorous achievements. The translator, in giving a prose version of the tale, has preserved much of its early poetic character; hence a quaintness of language and an easy regular flow of words that would convey a tolerably good notion of the original, had it been written in the English tongue of that period. The illustrations are quite in keeping with the text—strange and unnatural, yet exhibiting considerable talent of picturesque description. The imagination of M. Doré is richer and more facile than his pencil is ready in carrying out his thoughts; and he has not yet learned the art of "effects."

COTTAGE PICTURES FROM THE OLD TESTAMENT. Published by J. H. and J. PARKER, Oxford and London.

A series of twenty-eight subjects judiciously selected from the principal events recorded in the Old Testament. There is no artist's name attached to any one of them, except that of the lithographer, B. Hummel, nor any letter-press to afford this information, or information of any kind. We suspect, however, that the designs are of German origin: they are excellent in conception and drawing, and are very carefully coloured, so as to render them most suitable for the purpose indicated in the title. Half-a-dozen of these prints hung in a cottager's room would not only ornament it, but would prove instructive to its inmates in matters both of religion and of Art. Surely the time is come when such works must take the place of the abominations in tinsel and gold, which one has so often seen defacing the homes of our peasantry and artisans, vitiating their tastes, and not unfrequently demoralising their minds. There is now literally no excuse for the circulation of such trash as the masses have had offered to them, till within the last few years, as their only "pictorial food."

THE ART-JOURNAL.

LONDON, NOVEMBER 1, 1856.

NOMENCLATURE
OF PICTORIAL ART.*

BY J. B. PINE.

BEAU-IDEAL.

By beauty thus stands out by itself, prominent as distinguished from deformity, intentional as a work of the Creator, self-repeating and self-sustaining, as is every other work of creation, there will be little difficulty in adjusting its position in connection with the third and intermediate theory, which would make beauty and deformity depend the one on the absence, and the other on the presence of fitness. The deeper the insight we gain of nature, the more we are able to see that this exquisite fitness is equally a characteristic of the beautiful and the deformed, and that there is as yet nothing discovered in which it may be said that this fitness is even comparative. On the contrary, so transcendent does it appear in all instances, so universally beyond the conception of man, that he acknowledges himself to be left without a scale by which to measure the fitness of one thing with the fitness of another. He cannot thus qualify a particular instance in nature by attributing to it some one particular amount of fitness, as nature herself, in this respect, presents us with no degrees; but merely may it be discovered to possess for him some particular degree of fitness or unfitness for some particular arbitrary or foreign purpose to which he would force it. Barely can he do so by supposing it to have different degrees of any apparent present utility—depending, most likely, on his own comparative ignorance, rather than knowledge of the possible ultimate future uses of that which, at any one precise time, may appear to be useless; but to do so he is forced to resort for a comparison to a greater or less beauty or deformity. Thus, then, if anything in nature has in it anything in common besides its own particular identity and presence, it is this invariable fitness. If it have beauty or deformity as well, it has also fitness. Fitness being invariably found, it cannot be called in as a distinguishing mark to separate one thing from others, all which other things having the same amount of ultimate fitness as a general all-pervading quality. This appears to be as plain as that one cannot identify some one particular letter, in a book that may be printed altogether in black ink, by stating the letter to be black; and in the instance before us, the great distinguishing external characteristic of things resolves itself into beauty and deformity. If

utility and this fitness could be said to constitute beauty, all the world would be beautiful, as it is all possessed of this fitness, and neither the fact nor the term for deformity had ever been felt or discovered; while beauty itself, either morally or physically, had never been appreciated, from the very want of some antagonism by which to rate its amount.

It were impossible to overrate this fitness of all creation, its necessity, its ultimate completeness; though in the equally necessary absence of infinite knowledge it were, on the contrary, easy to underrate it, and to imagine the possibility of its possessing degrees by which one thing may be rated as in some measure unfit when compared with the admirable fitness of another: and this imagined possibility, untenable in itself, has been at the base of an erroneous theory of a beauty constituted of an admirable fitness contrasted with a deformity arising out of a fitness less admirable; and, ultimately, out of a great unfitness constituting an ultimate deformity. A notable instance of an error growing out of this absence of knowledge, occurs in the first estimate formed by naturalists on the construction and animal powers of the sloth. It must be that specimens of this singular animal had been first transferred to this country before those persons who actually captured them had thoroughly become acquainted with the whole of their habits. They were then placed in the ordinary den, or cage, of our museums, and created much attention by the then unaccountable fact of their walking, or attempting lamely to move, on the outside of the paw, instead of—like other animals—with the bottom of the paw on the earth; their long hooks, or claws, in this position lying parallel with, instead of perpendicular to the ground. Upon the appearance of this singular phenomenon, the whole of the half-philosophical world were very much inclined to the delusion that they had caught creation napping in the production of an animal with four legs and feet, but at the same time without the power of readily walking; while at first sight a very natural notion prevailed that it necessarily should be capable of walking, if only in search of food. However it might have been, this fact of the absence of a power of easy locomotion much perplexed people, and the perplexity set afloat numberless more or less strange theories to reconcile it with the generally received belief in the universal fitness of things.

The two most singular of these theories being, the one that it offered an extraordinary proof of the as generally received axiom that there is no rule without an exception—this being an exception to the rule of the universal fitness of created things; and the other that some animals, perhaps being at the same time epicurean as well as carnivorous in their tastes, and loving sloths, this derangement of the locomotive powers in the latter animal might have been an arrangement for rendering it a more easy prey.

These little delusions, however, vanished under a fuller knowledge of the habits and locale of the animal in question, up to this time considered the most "injured, unfortunate, and melancholy of all living things;" and those peculiar structural characteristics which at first view seemed to threaten its probable long existence, were ultimately discovered to be as felicitously contrived to continue the species to eternity. In no respect could they have been otherwise so well adapted to this end, either as regards the sloth itself, or the food that was to sustain its life. Hung by those long crook-like claws under, instead of upon, the branches of trees, the sloth was thus suspended amidst the fullest and richest supplies of its constantly accumulating food, which position it was enabled to keep for any length of time from the

great strength of its feet and the crook-like character of its suspending claws. We have now nearly done with these opinions, which would disturb the position of beauty on the earth, hustle her from her throne in the heart of man, and warp the beneficent intentions of the Creator in the great object of creation. This third and intermediate theory, then, carrying with it all the weakest characteristics of an invention of man rather than a discovery, falls to pieces from its own want of fitness. The want is self-evident in its own premises, which disappear in every evolution to establish themselves; and if anything said here may even tend to dissipate what I imagine to be the errors of the second and third theories, much good will have been achieved, as by a constant displacement of error, and a re-agitation of any subject, truth will be the more likely to make its appearance.

There is one grave error indulged in by the inartistic public arising of the term *ideal*, which goes far to weaken the claims and obscure the real character of the beau-ideal. It is, perhaps, unfortunate that the term ideal has been adopted, as it has created a notion, and a widely-spread one, that the beau-ideal is an inventive beauty, which though under an easily appreciated form, as illustrative of man, is, nevertheless, never actually found in nature. This supposition that the beau-ideal is never found in nature is entirely erroneous. That the exquisite perfection of the details of the human form, found in those sculptures to which we assign the characteristic of the beau-ideal, is incompatible with the powers of nature, is equally so. It may be said, in opposition to this view, that a search through a thousand instances of the human form may not present one perfect individual. The obvious answer to which is, search through ten thousand. If ten thousand will not yield one, try ten million. If Europe itself prove unproductive, try the remaining quarters of the globe; and if the whole world itself present but one individual at any one time equal to compete with the beau-ideal of the *élite* of the sculptures of antiquity, it will be a sufficient vindication of the power of nature to produce that which has been all but universally considered to be an invention of man: morosely considered as an egotistical illustration of himself; and beneficently, as one of his most fervent as well as purest aspirations after perfection.

The existence of the beau-ideal then is, on the contrary, one of the great facts in nature, and not a gratuitous invention of, but a mere reproduction by, man from its original type. It demonstrates the highest intention of creation as to form; and if realised but rarely, so much the more value attaches to it when found. The general everywhere-to-be-found character of the human form is merely a vacillating line which degrading influences have been able to warp round this high central one, to which, or from which, the same vacillating line may be said always to either tend or deviate. It is the want of a due sense of the grandeur, the purity, and the beauty of this intention of creation towards the beau-ideal, that gradually depraves the mind itself; and, ultimately, in its lower states of pictorial degradation, induces one man to paint you a Jesus Christ with bunions and bandy legs, and another to disguise the world's Redeemer in a watchman's greatacoat, and a countenance that would undignify a watchman; while the same mental depravity, with a little more ignorance super-added, are sufficient to produce a crowd to admire them.

These eccentric and vacillating lines, playing round the pure one of the beau-ideal, may be compared to vice, in its thousand forms, surrounding virtue—shaking her pedestal without destroying her, but at the same time shrouding

Continued from p. 29.

her from public contemplation: and it is only through this hurly, boisterous, and glibbing mob, that it may be approached with the constantly-increasing risk of being permanently fascinated on the route by some less worthy object than the one originally sought for.

The Greeks—whatever might have been their mode of study, and guided by whatever principles—seem to have been possessed of a more indomitable constancy than the moderns, in this pursuit of the unvaried beauty of the primal form. It is now pretty generally considered that their search was principally for a mean and central line, dividing equally the erroneous and varied lines that presented themselves in the common nature round them; and it is more than probable that long before the time when in this country instances of the beau-ideal may become as frequent as they must have been with the Greeks of the artistically classical period, this mean or central line in nature will again be the great object of study. It is quite evident that the power cannot be gained by the classical sculpture alone, though more than likely that it may be approached through it, as an unexceptional source through which to acquire the power of drawing, but a very equivocal one for imitation; for a man must rise above it to be able to do the like, as execution is always below conception.

As a great artist, better to have never known the antique than to suffer it to absorb the entire affection. Better by far begin afresh, and look again upon man in the aggregate as the beautiful of that nature out of which he has been called. And may we not find, by a comparison of himself with his constituent nature alone, a path by which to arrive at a comprehension of his beau-ideal? It were easy to broadly answer this query negatively by stating, that if it may not be arrived at by this process, there is no other open by which it is so likely to master the solution. The Greeks either might or might not have proceeded upon this broad ground of centralising man. If they did, there is no record of their aim or plan, except as derivable by supposition from their works. This supposition, as given by the older cities to the world, is an entirely gratuitous one, without why or wherefore, and has consequently been altogether discredited, or held in very weak faith, except by those few who—without any such intimation—would, in their own sound mode of reasoning, have struck out again the same theory.

The aim will now be, instead of giving again the unsupported dictum, to establish the fact of the existence in actual nature of the beau-ideal, and clear a path to it by analysing man in his state, form, place, and sentient and mental qualifications, as affected by the simple and single test of centralisation.

It may be admitted as a starting point, though with the risk of somewhat vexing the question, that man is not strictly, entirely an original; for what can be strictly so in an eternal order of things, in which all is either concentrically or excentrically analogous? For, allowing the universal dictum that he is within himself an epitome of all creation, or of the world—taking more confined grounds—this duplex character limits in some degree his entire originality, in establishing his reflected and composite nature—an union of all the elements of nature, differing in form, with superadded mentality and future life. Take at first, for instance, the most general and least particular of all other qualifications—that of size. He may be stated as exhibiting a perfectly central position, off which to measure upwards to the largest, and downwards to the smallest instances of animal life useful or employable in labour; that is, midway between all those who have to sustain life “by the sweat of the brow.” Take a next general and com-

prehensive point as affecting his existence—his place on the earth, and this will be found to be central or mean also, nicely poised between the hotter and colder regions. For however it may be possible to find human organisms capable of sustaining life imprisoned in snow dens in the frigid, or like an animal of the field lying under the shelter of leaves in the tropic zones, the temperate portions of the earth are best suited to the production, cultivation, and sustentation of the moral, intellectual, and physical man; while his reproductive powers, under temperate climates, doubles the ratio to be arrived at in either tropical or frigid countries. Many will insist that there are organisms as fitted for the one extreme as the other. Granted! And there is nothing lost by the admission, for it may be asserted that, for every one fitted for either one or the other of such extremes, there are twenty who are not, and those fare equally well under a temperate sun. At any rate, take man in the aggregate, at the zenith of his capabilities, and he is only to be found in those parts of the earth enjoying a middle temperature.

Again, in assigning him a place in relation to his size and its necessary proportions; their characteristics will be found to be central—midway between the large and the small, the light and the heavy, the attenuated and the bulky; their proper range alternating in degrees between the elegant, the beautiful, and the dignified. Taking the both together it never rises to the grandeur of the pillared and domed elephant, nor descends so far as ever to bear a humiliating comparison with those lesser animals whose fragile structures are disarranged by a breeze or destroyed by a shower, but holds a medial position between the two. Man never ascends to eminent grandeur by means of his general outline alone. His arms would appear to hang, and his legs to stand in the way of an ultimate grandeur; and by the head alone, burning in its intellectual intelligence, and glowing under the effulgent influence of high passion, does he ever achieve it. By the exhibition of intellectual power in forcing an adverse situation, the head alone, with even the weak accompaniments of arms and legs, may become sublime. On the contrary, an unintellectual man by means of his general form alone under no circumstances may even become grand, though he may be born eminently beautiful, though he may have even those proportions which a sculptor may, in courtesy, pronounce grand. As regards, again, the mechanical forces, he remains about the centre of animated life, neither possessing the quickness of one species, nor the mastery over weight of another.

The most difficult thing perhaps of all others to accede to is, man's mean state as regards the senses, or some of them, inasmuch as through these he receives the first intelligence on all subjects that lead to the completion of his intellect, and render him ultimately the most intelligent of creatures; and so much so as to induce him to pronounce all the rest of the animal creation to be destitute of the reasoning faculty. It would, therefore, be more consonant with our preconceived notions of the necessities, and, at the same time, more flattering to the hugeness of our egotisms, to find ourselves possessed in every instance of better and more perfect senses than our subordinate fellow animals. Be it as it may, however, he is found to be inferior to the bird in precision, if not general force, of vision; to the dog and many other animals in that of scent; and to many others in point of hearing.

It is far from an unamiable, unsocial, or rebellious feeling that induces this expression of opinion, and, while holding it, it ought at the same time to be inferred that this superior power of sight, scent, and hearing, in the lower

animals may be confined to certain modes only, and not to embrace a range so wide and diversified as that possessed by man, whose necessities, requiring a highly varied power of sense, have given him one of less precision as applicable to some one given purpose. This mean state of sense, therefore, instead of derogating from man, constitutes his gloriously general superiority over every other sentient being, giving him general while refusing him particular power.

Taste and touch, however, remain the comparatively sole property of our species, in which powers we transcend all other animals—if touch may not be made an exception in favour of some few whose locale precludes the use of what visual power they may have.

It is unnecessary here to speculate too minutely on the possible motive in the creative power for poisoning the human family in this medial state. It will be sufficient to draw particular attention to the fact for the purpose of establishing some grounds for future induction. A few words, however, bearing on our own particular subject may be admissible. By reflecting the whole of creation on the constitution of man, and making him—as a matter of necessity—medially an epitome of the universe, he is thus intimately associated with the universe itself. It gives him an instinctive interest and solicitude in the whole order of things as they are; and his mean state enables him to the more readily reach, as it were, mentally from one of their extremes to the other; the more so than if he were more closely allied to the greater or lesser instances of it. If, for instance, his natural proportions were less, he could not so readily acquire control over the large; and if much larger, he had lost power over the more minute; if either one or the other he had never been in close associateship with either. In fact, had he been of the size of the ant, his largest ships would have been less than a washing-tub, and he had never crossed the Atlantic; and if of the size of the elephant, he had never found earthly materials out of which to construct a vessel capable of holding two thousand of his huge companions. With the dimensions of one he had inumbered the earth; while with those of the other he had merely infested it.

In looking at any apparently incomprehensible fact in nature it is useless to wonder at the whys and the wherefores that it may raise, or to entertain them at all in the manner of doubts as to a perfect fitness. The time spent in doubt on this particular point is time thrown away, and one only begins to save this time when it shall be determined to receive all nature like a schoolboy receives the elementary portion of his education, in perfect faith and reliance on its being all right and necessary. The metaphor which describes creation as a sealed secret was conceived in a moment of libellous ingratitude and mental idleness, and has been merely received unquestioned by the world on account of an apparent ingenuity during its period of weakness. The more informed world discovers it to be merely looked, and at the same time finds itself to be the key. No rude instrument by which force is made to supply the place of skill, and through which fracture takes the place of discovery, nor any sneaking agent by which the wards may be passed; but the key itself, made for the express purpose, with a nicety of adaptation which finds a point of unerring and ultimate fitness in every minute phase of his nature. A more subtle ingenuity, and a more extended information will be able to carry this analysis through other and more striking channels than are here touched on, by which to further illustrate this general central position of our species, and deduce its perfect necessity from its resultant fitness.

Having in accordance with the previous views centralised man in the aggregate, examine

him now as an individual, always bearing this inquiry in the van:—Where is his beau-ideal? Where his ultimately perfect form and development? Does it obtrude itself in the giant, or does it hide itself in the dwarf?

The hope of finding it wallowing in bulk is just as preposterous as that of discovering it dwindling away in stunted proportions. It must then be looked for in the mean or central dimensions and proportions, like everything else having truth or beauty for its character.

If we descend from the general form to the members, it would be as hopeless to expect it in either the large or the small. The too largely developed head, with its either extravagant or stultified projects, no more than the one of contracted and inefficient organism, realises beauty. That the small hand pertains to nobility must be a sheer conceit; but, if true, added to its weakness, merely dissociates nobility from beauty equally with the large one, which is merely indicative of power. The feet would go by the same rule; and the legs must follow. On looking at the most classical works of the ancient Greeks it is impossible to refuse the conviction, long ago surmised only, that their search for beauty lay through some imaginary central or mean line, at once avoiding the full as well as attenuated, the big and the little, and that the proportions adopted for the minor parts were as studiously projected on the same medial adjustments. But it is not so certain that they decided these dimensions and proportions from a mean line deduced from the whole of the human races; and much more likely that they were content with those derived from the Greeks themselves, Greek giving to Greek. At the same time it is most unlikely, from what may be collected from their writings, that their conclusions were drawn from, or were biased by, considerations connected with the centralism of man himself in the creation. This may not be determined without a minute and extensive acquaintance with Greek literature, but it is to be inferred that the character and object of it did not tend in this direction, and that we are indebted more to the general inventive and tasteful powers intuitively possessed by that people, along with that well-developed form consequent in some measure on their climate, but more on their habits and manners, for that much of the beau-ideal that we have inherited from them in their sculptures. It may be said that we—that is the moderns—can do the same thing again, having access to the same principles. If it were not that such principles are no principles at all; and added to which we may, or may not, be in possession of the same amount of intuitive perception of the beautiful, and certainly not of the same advantages of climate, habits, and manners.

If we are—like so many savages—to look upon these sculptures in silent and unproductive admiration, as something very extraordinary, done by some now extinct very extraordinary people, it may or may not be all very well to go on admiring, spinning cotton, staining paper, daubing canvases, and emigrating. An aspiration, however, lies burning around the soul to transcend these glorious Greeks. It occasionally, at a single flash, consumes all these thoughts about cottons, papers, and canvases, and leaves in unclouded effulgence the inner orb of our civilising natures, prone only to transcend and beautify. We have already done it in politics, in diplomacy, in machinery, and in war, but Art has been left to thrive as it best may on empiricism and native courage, unprotected, and, in a great measure, unrecognized; and if ever we transcend in the production of the beautiful it will be by having access to more comprehensive grounds to proceed on, acknowledged to be at once rational and certain.*

* To be continued.

SUGGESTIONS OF SUBJECT TO THE STUDENT IN ART.*

BY AN OLD TRAVELLER.

CHAPTER X.

Old English Towns and their Market-places—A Morn of May—"Doing observance" more Yarmouth—The First Merchant—A Customer—Io Penny!—A Wish and its Frustration—Better Prospects—An Apology—The Privilege of Labour—Church and Trees—Chariots—Prototype in the Biga of the Vatican—Chariot Races of Padua—A Charioteer—A Horse of "worthie race"—The Rows—Venice—Verona—The Lactriata—Night in Verona—Home! still Home!—Burlington House in '55—Amateurs, Royal and Noble—Richard and Kate—Poets, Kings, and Commons of England—The Pride of Pembroke—A Hint from Mistress Gilpin—Fishermen of Norway—October departing—Consolations in November—Gaston Phœbus—Charles the Bad—The Banquet and its Events—A Great Misfortune—Messire Jehan Froissart—Raymond de Corasse—Messire Peter of Bearn—A Procession to Our Lady of the Woods—The Count's Hunting-party—The Vision—Forgiveness—Hunting at Home.

Not a few of our brave old English towns still make their boast of a market-place; so fair and spacious in every extent, so grave and dignified, or so quaint and rich in pictorial effects, that no painter, worthy of the name, could be dropped into the midst of one without resolving to perpetuate its every characteristic feature on the choicest canvas of his studio—soon to become the best loved, also, as successful progress should bring the beauty and value of his work into greater prominence.

Such a picture, as the artist so determined will produce, was presented to our fortunate eyes no longer since than the summer just by-gone—alas! for the bright and fair departed! when the last delicious morn of May was exhibiting her wealth of loveliness—as who should say:—

"Let the June your hearts are turning to welcome, O ye fickle sons of me! bring you aught more lovely than these *my* charms, which you will presently be forgetting."

"Was then the fair month envious of her sister?"

Nay, boy! do her no such grievous wrong; some shade of sadness there might be passing over her pearly brow, but for so black a cloud as that within whose folds pale Envy shrouds her ugliness, far be this from the Queen of months. She did but heave one sigh for the loss of your love, ye poor children of mortality, and methought the softness of her beauty grew ever sweeter as she mourned for that best of treasures—affection: affection born of heaven, and heaven's fairest boon to earth.

May! but the last of May! And the hour? 'Tis that early one of morning, the first to follow the sunrise, when the beams exhibit that delicious paly-gold of their youth, unknown to such as keep closed eyes until their mid-day splendours blind the world. Over all the fair broad market-place are scattered numbers of small, slender, dim-coloured fabrics, each much resembling a sentry-box; they are now lying, leaning, or standing about in rare confusion, but shall soon be all marshalled in trim array, such as Order prescribes in the mart when Traffic rules the hour.

As yet we have truce from the turmoil that shall prevail anon—the hour is yours, O Painter! One merchant alone is in the "receipt of custom," to apply for our own purposes a phrase due rather to him who gathers the fiscal tributes—one only, but a prosperous and well-appreciated chapman, as you see; since, of the few now but thinly peopling the ample space, a large proportion is either demanding, or in process of consuming, his wares.

"The cup
That cheers, but not inebriates,"

is that which you see dispensed, with appropriate edibles, by the "son of the morning," now adjusting his clean white apron (no true painter will start from the seeming bathos) for your especial benefit; and his consoling appliances are attracting within his orbit whatever can muster the respectable penny that shall pay for each steaming and well-odoured libation.

Ah! good, broad, honest, helpful piece, with thy clear brown ample disk, its huge weight all unfelt by the hardy palm of him, but too well pleased to enfold thee in his grasp, the boy with blithe frank

* Continued from p. 311.

visage and firm determined step, that now approaches the tempting board:—not on reddest gold or fairest silver is the welcome face of our sweet liege lady so dear to the eyes of youth, in another class of her loving subjects, as it is on thy much begrimed surface, stout, glad some penny of my heart! Dear, and doubly dear art thou to the "thews and sinews" of the nation, as it makes its way to manhood, after the rough, yet not unhappy fashion familiar to the youth now resigning thee for a something, at this moment yet more precious and more needful—great as is the store he sets by thy comely self.

Now I would that at no point throughout the fair breadth of our lady's realm were there one child to be found who could not command thee, much-availing coin! but even as we utter the wish, come the longing eyes of yon poor pale mother, making sorrowful confession that no son of hers may this morning boast of possessing the potent wealth represented by thy good round bulk. Woe is me, penny! can there not be some means found for enriching the group around her to that extent?

There can, for the well-to-do labourer, sitting there swinging his substantial yet not unshapely legs from the rail that he has chosen for a seat, while he waits for his comrades, who will come to aid him uprear the tabernacles for the sellers, *he* has turned his glance in her direction. He looks careless and unmoved just at present, perhaps; yet never doubt him; the daughter of wretchedness comes nearer, and ever as she does so, that great brown hand of his gets closer to the pocket within whose depth thy beneficent presence hides unseen. A moment more, and the consciousness thereof shall gladden the poor, lost, ragged, lazy-looking creature, slowly coming within reach of him who toils, and who can therefore give; aye, even thee, O penny!

You will say she has the trailing gait of the practised beggar, and affirm that her indolence cannot fittingly be upheld by the labours of the industrious. Well, I grant you that there will be a misappropriation of funds—for the woman evidently is a beggar from habit, perhaps from choice; but look at her four wretched children! There is not much to reassure one as to her future in those faded looks, and it may not be denied that her dingy rags have an air of the parish workhouse; neither is that gait, inert and purposeless, without its significance. Still there are the children, and for this moment what can be done? they cannot wait for a breakfast until the mother has been rendered provident and industrious, wherefore let the rigour of your judgment be relaxed, and suffer industry to bestow on Idleness his hardly-won penny.

She has not yet detected the good provided for her by our friend on the rail; but wait a moment, and if it were not that we prefer to have her as she now stands, and must fix her so, and not otherwise, you should presently behold a spurious kind of energy informing those languid movements, and the half-dead eyes would gleam, for at least some few short seconds, as her perceptions became awakened to the fact of that large hand, stretching forth, as it surely will be, to endow her with the wealth you wot of.

A fine old church, shadowed beautifully, as we now see it, by trees—rarely found standing on similar sites—give peculiar character to our market-place; and this is further heightened by the dashing approach of a carriage, also peculiar to the place—Yarmouth, in Norfolk, namely—nay, which you will find in no other. In form it is not unlike the Roman *biga*, as most of you have admired it in the rich white marble specimen giving its name to the "Hall of the Chariot," or "Salla della Biga," in the Vatican, where it forms the fairest ornament of that well-filled chamber of the gallery. Others of your number may have seen the same form of chariot, but in widely different material, as it whirls around the arena of Padua, and some few other Italian cities, where the chariot-race is still the rare exhibition of some extraordinary festival.

But to such as have not beheld that inspiring sight, the Yarmouth carriage will give a most sufficing idea of the vehicle; while in picturesque effect the English charioteer is in no respect surpassed by his Italian compeer. Frank of aspect, bold and fearless of demeanour, and bearing a whip, which he holds chiefly as a staff of office, he stands, a hero accepting a triumph, rather than a hireling driving a fish-cart.

"Woe is me now for *that* bathos, for this time it seems real." Yet no! it is again but in seeming, friend Zolus; do but look at the spirited air where-with he stands creak as he now comes dashing towards us at the speed of his swift, yet powerful horse: no creeping, cart-like pace is his—nay, the whole man is altogether different from those of his class elsewhere. Well set on his handsome shoulders, the head now has its crisp brown curls covered by a sturdy sou'wester; but how becoming is the confidence of its carriage, that head! and if he were to lift off the covering, what a good fair brow you should see! A short canvas frock next comes into view, with very loose trowsers of some nondescript material, with which you have the less to do, since they are almost wholly concealed by the classic form of the vehicle wherein he "comes spanking along." Spring aside, good friend, or he may chance to crush his critic, though to do evil be not in his habits. Mark him as he passes in full career, what a cheery-looking creature it is!—brown hues of health adorn his rough-hewn features,* a good-humoured word seems all but visible on his lips, ready to greet you; and his expression is such that if you wanted help in a crowd, it is just to his very self that you would turn to ask it. And you would choose judiciously—earnest in his labour, ready for all things among his mates, dangerous, perchance, if wrongfully assailed and deeply moved, he is yet gentle as the gentlest woman if he find you suffering; and that great rough hand shall lift the street-bred infant from its jeopardy with a tenderness of touch that only the mother's self could equal.

Then his horse—no unworthy portion of your group is he—strong, but not heavy; in the best of his age, and thoroughly up to his work, he puts the stones behind him at a pace such as no ordinary cart-horse "ever saw in a dream—he nor his fathers before him," as Eastern writers say. Is he not pleasant to look at—his small tapering ears pointing cheerfully forward, the bright clear eye, yet calm, and somewhat grave withal, bespeaking the excellence of his temper and the prosperity of his condition? How easy, and even pleasurable his task in this delicious morning air! no toiling, overwrought slave is he—"Warm and duly aired is my well-strawed stable, good and abundant is my hay, and my corn is of the best; pure is the water I drink, and never do the gross impurities I loathe come near the vessels of my service. Well fed and tended am I, and now will I do my work as a brave horse should." These are the thoughts you read in his comely looks, the good horse, and in excellent keeping they are with all else suggested by that group—man, horse, and classic-looking chariot. Let them only have, on your canvas, the life and movement they exhibit, and none shall say that this makes the worst portion of your picture.

Another peculiarity of the town in question is the frequency of those singular passages there called "Rows," of which there are many scores—nay, I think I have even heard that they amount to hundreds. They recall to the writer, as to others acquainted with the Lombardo-Venetian capital as well as the Norfolk seaport, certain remote parts of Venice, all unknown to the mere passing traveller; but still more closely does the "market Row" of Yarmouth—the best and handsomest of these passages—resemble that peculiar passage in Verona called the "Lastricata."

Leading from that great centre of gaiety for all who dwell in the city of the Montagues and the Capulets, the "Piazza Brà," this place is much frequented by the English and other travellers, who pass through it when returning thence to their hotels, or when proceeding to the amphitheatre, into which look the windows of the Lastricata on one of its sides.

But this assertion of resemblance must be taken with certain grains of allowance—more especially is there a difference in one respect, and that of no slight moment. Never in her wildest glee does Yarmouth pour through her decent thoroughfare so fearful a volume of sound as makes night hideous in Verona—yelling, howling, whistling, shrieking, roaring, bellowing, stamping, and tearing the af-

frighted air by whatsoever means their brazen lungs and ready limbs present—so does the crowd come rushing from the Piazza through that else fair paved-way called, because of that pavement, the "Lastricata."

And with this is the city afflicted at all hours of the night—nay, till deep in the morning; but less shall suffice you—listen to that unimaginable uproar but for one half hour, and the howlings of Pandemonium itself shall scarcely amaze you after that.

"We don't mean ever to make acquaintance with those howlings," some one is saying, in half-affronted tones.

So much the better, and your resolve is altogether praiseworthy; but then you must not venture within miles of Verona after nightfall, seeing that permission to roar their loudest is the sole form wherein a particle of liberty is accorded to the Veronese: and since they know it under no other, they make the most of their one privilege, to the sore discomfiture of the stranger—loving quietude—who dwells within their gates.

Your chief magistrate, Mayor, or whatever else may be his designation, would presently teach you better manners, O respectable Yarmouth, were you ever to forget yourself to such extent!—but you never will. You have voices, and know how to use them—aye, in mighty volume—what should ail you else? But you do not care to abuse the power, and that makes all the difference.

Yet—would you believe it?—when we have made our boast that neither by people nor rulers would these senseless outcries be tolerated in our own free townships, have not these benighted Veronese moaned in pity over our fettered state? They have—incredible as this may seem to you, ye men of Yarmouth; they are blind enough to view the matter thus, and that's a fact!

For those peculiar passages, the "Rows" then, are the picturesque English chariots you are here to paint constructed; they suit each other to perfection, and long may they sensibly continue to go on together prosperous and harmoniously as now.

Remaining still in the sweet motherland, nay, penetrating into those recesses of our domestic history as a nation, that no stranger, save as he be more than commonly privileged by that adoption of us and ours implied by love for what is best in us, may claim to follow, let us turn to one of the most touching episodes in the home-annals of the bygone year. Calling memory to our aid, let us suppose ourselves to be once again proceeding through that heart-appealing gallery then established at Burlington House, that is to say, for the works of amateurs labouring in a most sacred cause,* and tell me whether any collection, though it were the most renowned and long-desired of all fair Art's wide-reaching domain, hath ever won from you so much respect as was accorded from your heart of hearts to that exhibition?

For ourselves, we can truly say that many a collection, to the sight of which we had long aspired, and had at length attained—perchance at no small sacrifice, and considerable, yet freely expended, cost—has failed to impress the writer as did that one; its contents offered from the hearts of our highest and noblest to alleviate the necessities of those who had laid the vast offering of their best and dearest on the altar of our common country.

Surely none could examine the closely crowded walls of those numerous chambers without the instant perception and acknowledgment that in these were presented to him something altogether different from the ordinary assemblage of mere artistic efforts, always attractive, and often most admirable as these are. No place for the hard-eyed caviller was here; from the wearyful hyper-critic in Art we had for that time welcome truce; no cold and harshly judging glance was that bent by the deeply impressed visitor on those gifts of the heart, expanding their bright wealth before his moistened eyes; but on every face might be seen evidence of deeply-moved feeling, and the least impressionable felt himself, at least for that moment, a more sympathising, a gentler and a better man.

Passing, on a certain occasion, through the rooms, and listening to the kindly remarks of some accomplished foreigners on the exhibition and its objects, the writer was frequently much interested, and always greatly amused by the various "compositions" grouped by them from the figures, and landscapes, or interiors, as the case might be, so richly abounding around us. With this employment they occupied themselves, as the result of a previous disquisition on that unhappy theme, the tendency of our professional artists to do their talents less than justice by the choice of a subject too frequently treated; this question then attracting much attention from the friendly critic and true lover of Art, as it has done in the season of the present year.

Here are some few of the groups or compositions thus formed—so far as memory has retained them. In the first we had the illustration of some well-known stanzas from Bloomfield's "Richard and Kate:" bard, people, and painters, all specially English, seeing that the verses were those that follow, and the peasants were such as make the pride of our fair country, depicted by her Royal Highness the Duchess of Gloucester, the Marquioness of Waterford, Lady Florence Legge, Lady Catherine Allen, and others, the noble maids and matrons of the land; while the site and structures were equally from English pencils—those, if my recollection serve me rightly, of Major Enard and Mr. Forbes Irvine. The stanzas chosen by our courteous "visitors from afar" were these:—

"Kate viewed her blooming daughters round,
And sons, who shook her withered hand:
Her features spoke what joy she found,
But utterance had made a stand."

"The father's unchecked feelings gave
A tenderness to all he said:—

"My boys, how proud am I to have
My name thus round the country spread!"

"Through all my days I've laboured hard,
And could of pains and crosses tell;
But this is labour's great reward—
To meet you thus, and see you well."

Incidents from the poems of Scott and Byron—authors ever highly appreciated by foreigners—were set before us in rich abundance, and with the most life-like effect, by aid of the northern scenery and people, or those of other countries, so abundantly furnished by the pictures before us. Around the Countess of Clarendon's "Cathedral Porch of Ulm" was grouped a melancholy assemblage, in illustration of an event which occurred at that unhappy period when the building, transferred from the Protestant inhabitants, was resigned to those of the Roman faith—but we will not sadden ourselves by the repetition of its details. The great deeds of our early kings, and the martial prowess of those who founded more than one of our proud baronial houses, with the sturdy uprightness of some who, originally belonging to a different degree, had eventually made themselves a name now pre-eminent among the highest, were in like manner pictured to the view—the works of Colonel Forbes giving good aid to the story of our Norman kings. Nor were the acts of noble daring that so finely illustrate the annals of our popular classes forgotten: the sea-pieces of the Countess of Uxbridge, Miss Campbell Robertson, and some others, gave birth to many a story of heroism displayed along our coasts: among the most striking of these was one suggested by that pride of the southern Cymry—the "Pembrokeshire Fisherwoman" of Lady Catherine Allen; they would lead us beyond the space permitted by my present limits, but are quite too good to be lost, and are but deferred to some more favourable moment.

Almost incredible instances of bravery, and of the still more beautiful fortitude of endurance, were described by an eye-witness of some among them, in relation to incidents connected with the late war; and of these, illustrations were gathered from various points, and most ingeniously arranged for their purpose by these flattering admirers of English "being and doing;" but I borrow a lesson of discretion from Mistress Gilpin, of undying memory, and withhold them—

— "Lest all
Should say that she was proud—"

of the beloved country, that is; and your servant is all the more unwilling to incur such accusation from a kind of consciousness that it could not be successfully repelled; wherefore let us rather take a pic-

* I am told that features very finely cut, yet always in manly mould, are by no means rare among this fine race of men, and there is no reason to doubt the truth of that assertion; but I write what I have seen, and as I saw it.

* All will perceive that this can refer only to the works of amateurs, exhibited "in aid of the fund for the relief of the widows and orphans of officers engaged in the war with Russia, opened by special permission of Her Majesty's Government at Burlington House."

ture referring, not to ourselves, but to those of another land; yet one which the artist who loves the ocean or its bold and rocky coasts will do well to rescue from its present condition of non-existence, since it cannot fail, in his hands, to prove a highly efficient work. The subject is a custom, described to the knot of friends then holding colloquy, by one of their number, himself a native of the country where the poetic and touching rites in question are performed; it was suggested by one of the Norwegian fiords, before which the party stood as the speaker proceeded.

"In many of our fishing villages," commenced the animated narrator, "is still maintained the custom of sending forth the fishing barks, as they did of yore the ships of the sea-kings, to the music of a wild chant sung by our women, who assemble on the shore for that purpose, and mingle their voices in lays, which, despite their rudeness, have all the force and fervour of prayer."

"One of your own accomplished countrywomen," continued the speaker, "has rendered these harsh measures into song, that has but the one defect of too elegant a *tournure*—with this exception, the short specimen that will serve our purpose, and which is known to most of us, presents an exact copy of the original rhymes." The verses were then indicated to such as did not know them, and are those that follow; the grouping of the picture was next completed with great spirit from the figures around us—a process carried on much to the gratification of the parties engaged, but which I do not further particularise, leaving you to group your figures after your own liking. But be very certain that a charming picture will be the result, if you prove only half as successful as were the genial amateurs of another land, then rejoicing, like one of ourselves, in the beautiful, and more than beautiful, exhibition of character, no less than of ability, presented to their respect and admiration by the works around us.

The song chanted by these Norwegian sisters, wives, and mothers, I give below. They do not raise it until the last boat is fairly on its way, since it is rather a cry for the return of their beloved than supplication for success. Thus, your barks are all afloat, a scene of life and movement they make—but we remain with the wives and sisters; let us listen to their lay:—

"Come back! come quickly back!
Brother and sire come home!
Thus cry your loved ones on your track—
Husband, and lover, and son—'Come back!'
Over the surge and foam.

"Come back! come back! safe and loving us still, come back!
For our hearths are dark, and our souls are drear,
Till we see the light of your looks draw near.

"Husband, and lover, and son; brother and sire, come home!
The breeze has freshened, the sun gone down
Over the beaten foam.

"Sorrow and joy are ours, beyond what landsmen share;
Sorrow in every morn's farewell,
And joy beyond compare,
When at eve—all doubt and danger o'er—
Your boats bring all to the strand once more.

"Come back! come back! safe and loving us still come back!
For our hearths are dark, and our souls are drear,
Till we see the light of your looks draw near."

Other pictures, illustrative of history, poetry, or manners, and chiefly, as has been said, from our own annals or domestic habits, were formed in that suggestive gallery, and in like manner, during the long and pleasant morning in question, but we have not place for more.

Some one says, "But you promised that we should remain at home awhile, and this Norway 'is not in the bond.'"

Well, and thine for you, your honner, Norway is not precisely at home, but neither is it so far off as to be altogether out of sight, in regard to the keeping of our agreement—for, after all, the Norwegians are a kind of cousins to us; or, if you wont admit the kin, they have still a claim, seeing that by them and theirs it was that we were first flogged into shape for making a people. "Flogged," since no milder word can describe the process—scourged rather, and that with a whip of scorpions; but none the less put on the track to become a nation, since it was by them we were compelled to form a navy, as you cannot deny. Admit, then, that in sailing to Norway you are scarcely travelling "that far frae hame;" or, if your logical perceptions

seek to convince you that herein is a mere fallacy, bid them carry their subtleties to some other market, and do you begin earnestly to paint me my pictures; not a stroke of your pencil but shall be worth a pocketful of syllogisms, and that you shall see.

Rich coronal of the year's best period, delicious October! Dear to the painter for the gorgeous lustre of her beauty—esteemed of the moralist for the steady rectitude of her character and the evenness of her temper—beloved above all by the traveller for that last quality, seeing that in no English month can he hope for equal consistency of purpose or propriety of deportment—and valued by each and all for many another virtue which need not now be enumerated, the dearly-prized October is preparing to leave us. Woe is me for the symptoms of that coming sorrow—they are not to be mistaken; already has the golden brown of her flowing mantle begun to exhibit the sere and paly yellow that betokens departure: pass some few short fleeting days, and the last of the year's fair daughters shall vanish from your eyes. O brethren of the pallet, even as we mourn, there come the sounds of her footstep, fast hurrying from the vapoury breath of her dark kinsmen that are to follow, and leaving many a heart forlorn.

Yet not to all will this, the exodus of October, prove a cause of grief; there are to whom the advent of her grim successor will bring the best-loved of their pleasures. Yea, even among the sons of Art shall you find such, for not unknown to that bright band is the lover of the Chase; nor is he always with the herd who "tail off" before "the dogs run into him," as the men who call their scarlet "pink," are pleased to phrase it.

And they don't mean before the dogs "run into" the artist, as the "muffish" fashion of handling their jargon, proper to this poor scribe, would seem to imply: *à Dieu ne plaise!* they mean into the fox, poor fellow—but catch them giving him the good old ancient respectable name of his family! not they, the goosecaps! he is Charley, or he is Pug—yet wherefore Pug?—or, worst of all, he is "the villain," though why that last it might puzzle the wisest among them to tell; for if there be villainy in the case, it is rather in the two-legged assailant by whom poor Reineke is driven to his wiles, than in him who is but struggling for dear life. Or admitting that he does trim and take to crooked ways occasionally, is he the only trimmer? and is not any turn permitted if it save his sons from coming to grief for lack of his surveillance?

"His sons are old enough to take care of themselves, and his daughters are well established."

Let it be so, and I rejoice to hear they have been so fortunate, but—

"But! He'll be taking care of your poultry-yards, if we don't take care of him."

"Ah thin! and small blame to him, if we have the door open; 'tis necessary wolves should ate, have alone foxes. But why would I be talking reason to a fox-hunter, when he'd rather be bearing what he calls music—mauling, dogs that bark?"

"He might do worse," some one says. Well, he might! murder and arson to wit; or he might be given to the cold and cruel baseness of the turf and gaming-table—black as either fire-raising or murder. So, if we can't give the best of our heart's cordiality to those who thus misappropriate too much of their time, yet, for the love of certain traits that embellish the character of the true sportsman, still more for that of some who love the hunting-field, if not "wisely," yet but only a very little "too well," do we at this season listen with patience, if not with warm sympathy, to the gladsome anticipations now succeeding, to talk of the moors, the partridges, *et id genus omne*. Nay, further, as eels get to love being flayed, so do we begin to find the theme not so much out of place when November—but for this resource a repellent member of the family of months—has brought his lowering face to the homestead.

For the sake of some among your painting fraternity, past and present, then,—their names will not be slow to present themselves,—let us turn to certain passages in the lives of mighty hunters—no lack of such in our frank laud of sylvan as well as all other fame: yet, remembering that high authority who saith—

"Home-keeping youths have ever homely wits,"

suppose we first look elsewhere, and take pallet in hand for other times as well as other countries?

You have not now to learn how Gaston—third of that name—the Viscount of Bearn and Count of Foix, was called Gaston Phœbus, chiefly because he was a mighty hunter, as it suits us to believe; certainly because he did without doubt rival Apollo in the beauty of his person if not in the use of the bow, and not, as learned folks, who love to spoil sport, will have it, because he had chosen the sun for his device. The first two reasons are good enough for us, and shall suffice for our purpose.

You know, too, how unfortunate Gaston was in his connexion with that worthless Frenchman, Charles of Navarre, called deservedly Charles the Bad, whose sister he married, and who subsequently caused the son of Gaston unwittingly to attempt his father's life. For the miscreant Charles persuades his sister that a certain powder which he brings her will secure the return of her husband's affection, falsely declared by him to be estranged from her. This then the countess encloses in a small purse, and suspends around the neck of her son, then on the point of returning to his father from the court of Charles, where she was herself residing—enjoining the youth to mingle the contents secretly with his father's wine, that so the love of the count might return to them both.

This moment in the life of the unhappy countess would scarcely disappoint the hopes of him who should choose it for his subject, if treated ably; but we leave it, and pass to others.

The poison is discovered by Gaston Phœbus, who takes the purse from his son's neck as he sits at the banquet with his great vassals: and calling to him a dog, gives him a portion thereof, when the animal dies instantly, and the nature of the powder becomes apparent to all.

Placed in durance, the boy will not criminate his mother, and resolves to starve himself in the chamber that serves as his prison. He conceals his purpose so well, by casting his food from the window, and by the help of a dog, that he is all but dying when the attendants discover it, and make the facts known to his father. Gaston at once repairs to the apartment of the captive, with severity in his aspect, but deep grief in his heart; the boy advances to throw himself at his father's feet—perhaps to confess the truth. But Gaston extends a hand to prevent him, and in his haste to examine the features of his child for that change which had alarmed the attendants, must needs have forgotten the small penknife which he was using when summoned by his servants, and which, in his agitation, he had neglected to lay from his hand.

Thus only can what then happened be accounted for, since all that is known of the matter goes to prove that in this act the point of the knife must have entered the throat of the boy. Yet so slight was the puncture, that at the time it passed unheeded—no one, perhaps not the young prisoner himself, was aware of the circumstance; and his father, after remonstrance and exhortation to better purposes, left the youth to his reflections. But not many hours had passed before Gaston Phœbus received the terrible intelligence that his son—the only one his wife had given him—was dying from loss of blood. Weakened by his previous abstinence, the slight incision, then only discovered, had sufficed to exhaust his remaining strength, and the boy was dead before his unhappy father again reached his prison. From the effects of this calamity Gaston Phœbus never entirely recovered.

These things are known to all, and few will have forgotten that among the learned men—very rare in that day—entertained by the Count de Foix at his court, was the chronicler, Messire Jehan Froissart, from whose enchanting pages it is that what you here find is gathered.

The name of Raymond de Corasse, another favoured baron and frequent guest of Gaston Phœbus, will also be familiar to most readers; but what may possibly have escaped your notice, is the fact that this baron had a familiar Spirit, who, offended by some act of indiscretion on the part of De Corasse, forsook the castle of that feudatory for the neighbouring woods, where the previously gentle and friendly sprite subsequently appeared in the form of a wild boar, exhibiting more than common ferocity. Now, in that day, none would presume to harbour the shadow of a doubt

touching the personal identity of the spirit and the boar—neither are you permitted to do so in this present year of grace, though it do call itself eighteen hundred and fifty-six; seeing that for all the pictures you have already in thought commenced, or presently shall begin, as relating to these matters, you have the sanction of that "learned clerk," the delightful Messire Jehau aforesaid. His sanction for the fact that such things were *told*, that is to say—for his credence of all the marvels related, we do not vouch, nor does the question greatly concern us.

Thus, then, the story goes. Raymond de Corasse died, declining from the day of his familiar's departure, and expiring before the completion of the year: some time after, it chanced that the brother of Gaston Phœbus, Peter de Bearn,—whose lady-wife, the Countess Florence of Biscay, sister to Peter the Cruel, did herself relate the particulars to Froissart,—set forth to hunt this boar,* who had terrified his huntsmen by turning round upon them with fierce remonstrance, when too closely pressed by their dogs. But Peter de Bearn said, "Let the Boar talk at his pleasure; we are no babes to be baffled by words," and accordingly he was not to be entreated from hunting this boar as above said.

Many hounds and not a few horses died in that encounter, but Messire Peter finally prevailed, he bore home the carcass of the boar in triumph; but every night thereafter was he found, by his terrified servants, uttering fearful cries, making a furious attack on the figures of the tapestry that adorned his chamber, and plunging the Bordeaux blade, wherewith he had finished the boar, into each and all, because persuaded that each in turn was the very boar in person.

This continued, and he could obtain no rest, until a certain monk from Pampluna, well skilled in the exorcism of spirits, had performed many and potent ceremonies for his behoof.

Thus you may paint Messire Peter, if it so please you, as follows, for therein shall you not depart from historic truth. He has fasted through nine successive days, he and all in his castle, the learned monk not excepted. You now have him walking with his servitors in long procession, to the chapel of Our Lady in the Woods; on his person the proud knight bears no other garment than the short and scanty cassock of penitence, in common parlance called a shirt; barefoot, with uncovered head, and downcast features, he follows humbly after the monk of Pampluna, a lighted taper now occupying the hand that most commonly bears more formidable weapons. The vassals of Messire Peter are also barefoot, but are else clothed in their ordinary garments, as being less guilty than their lord, by whom they had indeed been compelled reluctantly to enter on that forbidden chase.

All these things were recalled to the recollection of Gaston Phœbus by friends and servants, when his huntsmen reported that the same boar—again in life, notwithstanding the prowess and the penitence of his brother, Messire Peter—was then ravaging the woods of Sanve-Terre. Yet was he not to be deterred from attempting the chase, and on the following day he too went forth with that intent, accompanied by Froissart himself, and by many others, his kinsmen, guests, and nobles.

Five hours the chase proceeded happily; fresh horses were then mounted, and for three hours more the company kept well together. A new pack was then uncoupled, and with these, Gaston Phœbus, with Froissart and some others, continued the chase, but gradually the hunters fall off, Gaston alone cheers on the dogs, and of these few now remain. At length his four staunch bloodhounds, brought at his command by their trembling keepers, alone pursue the boar; twilight succeeds, and even they come trailing on exhausted, and uttering a melancholy howl. But the voice of their master arouses them, they resume the track until darkness shows them the eyes of the animal, ominously casting a lurid light on the else invisible path he pursues. Three of their number then refuse to follow, one dog only now accompanies Gaston Phœbus, and the boar has turned to face him. Boldly the faithful Brux springs onward, but at the moment when his jaws seem fastening on the bristling hide, the wild boar has vanished with an unearthly cry, and the count's

horse sinks beneath him. Freeing himself swiftly from the fallen animal, Gaston Phœbus draws his hanger, and hurries to the point where he had beheld the red eyes of the boar flaming beneath a huge tree, unable to persuade himself that the disappearance he had witnessed could be real; but he finds nothing save his hound, whining mournfully and shaking with terror. Encouraging the faithful creature as he best might, Gaston Phœbus laid himself by his horse to take some rest; the trembling Brux crept close beside him. After a time the count rose to seek shelter, or perhaps only seemed to do so—for there are not wanting persons claiming to be wiser than their fellows, who affect to believe what follows a mere vision; for myself I incline to think—but no matter, permit the chronicler to proceed.

The count rose from his rest, then, in the dark and silent forest, and after long wandering, perceived a castle, whose appearance was not familiar to him. This caused him no little surprise, since he was not so far from his own abode of Orbicz but that every castle should have been well known to him. He wound a blast on his horn nevertheless, and the drawbridge being lowered, although no warder appeared, Count Gaston passed across. Yet it was long before he could embolden his hound to follow his example, and not until he had been thrice summoned, did the usually obedient Brux cross the moat.

Astonished that no officers of the household appeared to receive him, no pages and no valets to give the due attendance, Gaston Phœbus was yet further amazed by the strange fact that his footstep awoke no echo, nor did sound of any kind meet his ear. One solitary lamp shone in the distance, and approaching this by a long corridor, Count Gaston perceived it to light a broad staircase, up which he took his way, and at the summit thereof beheld, stretching before him, the ample space of a banquetting hall, with the table spread, but no hospitable castellan to receive the guest.

Reluctantly the hound had followed, but he was there, and Gaston Phœbus was conscious to a sense of relief and comfort as Brux took a place at his feet, when he had assumed the chair of state prepared for his use. A silver whistle lay upon the table, and taking this, he blew the same to summon squire and page with water for his hands. Then the tapestry covering a door at the farther end of the apartment was lifted slow, and as it rose the hound set up a mournful howl. A figure was now seen to draw near through the dim obscurity of the chamber, but faintly lighted by a lamp suspended from the roof: yet was no sound of footstep audible, and the dog, desisting from his plaintive cry, began to tremble in every limb.

Slowly did that form approach the table, and a strange suspicion seized Count Gaston; a few more awful moments and that dread conjecture became conviction. The silent shape was too surely that of his buried child, and the heart of the brave man quailed before it, even though his conscience could not reproach him with wrong done. Gaston held forth his hands nevertheless; he stretched them over the basin presented for his use: that spectral form held the ever aloft, and as the appearance of water fell on him, a sense, as of heavenly blessedness, seemed to pervade his whole being: a something whispered, yet it was not the voice of his son, for the shadowy form uttered no sound; yet a perception was conveyed to him that the child had obtained permission from heaven to wash his innocently shed blood from the father's hand; the last sensation of Gaston, as he sank lifeless from his chair, was one of infinite consolation—his child had brought him forgiveness.

Many pictures, and those of varied character, present their changeful hues as this page of old tradition unfolds its revelations; the different moments to be treated must be left to the choice of the artist.

But in all this there is little of hunting, as we have it practised in that genial home of the science, an English hunting field, will some one say; and there is no denying that a day with the Quorn, the Cottesmore, or the Pytchley, will have more charms for him whose enviable lot—as a hunting-man—is cast in those brilliant lines: nay, the doings of what your Leicestershire "Cut-me-downs" are pleased to call that "slow" shire, which takes pride in the Vine and the Tidworth, would be more germane to the matter, so far as hunting in England is con-

cerned; but with what hope may the uninitiated venture to approach that theme? how attempt to fathom those mysteries, which, if you listen to hunting-men, would seem to render horsemanship and hunting more impenetrable, to all save themselves, than are the riddles of the Sphinx? No, the adventure is all too mighty, it demands more daring than has fallen to the lot of the present writer: your brethren, who mount the scarlet, are alone competent to depict the hunting-field, and to them we leave it.

ARTISTS' COMPETITIONS, AND THE PALACE OF ADMINISTRATION.

At length, probably, steps will be taken to remove one source of inconvenience and extravagance as to the manner of conducting the business of the government offices. People of average intelligence had been long wondering at the system of housing the public departments in various structures originally planned as dwelling-houses—far apart from one another, and entailing enormous outlay in rents, and repairs, and alterations of fixtures. The pecuniary injury from the mere separation of departments, and disorganisation of books and papers in the frequent removals, must, during very few years, have alone cost the country as much as any expenditure upon the structure and decoration of one adequate group of buildings would have done. Moreover, as to money voted for public works, the waste which there has been,—sometimes by what is falsely called economy, sometimes through changes of plan, and pulling down and rebuilding,—has painfully obtruded itself upon the notice of those who appreciate the material value of Art somewhat better than the British Government has hitherto appreciated it. For, in architecture, the requirements of structure and convenience, and the call for Art, are contemporaneous,—that is to say,—beyond the operation of any subtle influence of fitness upon decoration—it singularly happens that what is favourable to success in the one object, is ever correspondent with the course which should be taken for the other.

There are two points, however, of which there has long been—and, we are compelled to say, looking at the character of our streets and public works, *still is*—extraordinary want of perception amongst our governing classes: the first point being the fact that the value of mere Art is such as would demand expenditure upon its sole account; and the second point, that where a structure is required, grand architectural effect may be produced with little addition to expense,—if, indeed, the proportion which even elaborate decoration would bear to the whole cost, might not be always of inappreciable magnitude.

But, whilst ornament alone does not realise good architecture, it should be recollected that the union of many branches of Art is required for the highest architectural effect; and those branches, especially sculpture, it may be hoped will be largely brought into play in the Palace of Administration which the Government are projecting.

This building, or rather group of buildings, it is intended should ultimately occupy the large area including the site of the present Treasury buildings, the ground southward to St. George Street, between St. James's Park and Parliament Street, and that east of Parliament Street from Richmond Mews to Bridge Street, and inclusive of a portion to be reclaimed by embankment from the river; and the instructions have been issued preparatory to a competition amongst English and foreign architects. Certain proposed instructions were submitted by Sir Benjamin Hall to a number of architects, who were called together some time since; and premiums are now offered, amounting in the aggregate to £5000. These premiums are arranged in three classes, indicating those portions of the project to be first undertaken—viz., for designs for the Foreign-Office and the War-Office, in each case, seven premiums—one of £500, one of £500, one of £300, one of £200, and three of £100; and for a general "block plan," treating the whole area noticed above, and having regard to the improvement of the leading thoroughfares, including Westminster Bridge, whether on its present or some other site, three pre-

* Or, as elsewhere we have it, a wild sow.

miams—one of £500, one of £200, and one of £100; such designs being required to be sent in not later than the twentieth day of March next. It is proposed to leave the amount of expenditure to the competitors, as well as the style of the buildings; and a mixed jury of professional men and amateurs, and the exhibition of all the designs in Westminster Hall, prior to the decision, are amongst the other features of the scheme.

The actual instructions do not materially differ from those which were laid before the architects who were summoned—on which occasion, indeed, they seemed to have been presented as decided upon, rather than as the subject for consideration. Taking them as so presented, then, it does seem to have been unnecessary to call architects together; and it seems most unwise to receive one of those opinions upon the working of competitions in relation to Art which each architect, in his experience, has been able to form. Limited in proportion to the general question of competition in Art as such experience of individuals must be, the opinions referred to form both the chief and the essential data upon which the scheme of a competition should be based. Can it be possible for any individual not familiar with the history and practice of architects' and sculptors' competitions, to know the enormous amount of labour and money which must be given by the competitors, and how insignificant in proportion to it is the largest premium which can be offered; or to know the difficulties which beset the framing of instructions; or of obtaining, even from honourable men, an equitable judgment—in short, to know how prejudicial to the object of the competition, to general Art, and even to morals, is the practice which in varied forms now obtains. On the acceptance of competitions as a principle, we offer no present opinion; it may be consistent with the doctrine of political economy not to ignore it, and to that doctrine we will not for a moment make exception. All that we remark is that, in trade, competition has yet to be made to operate to the precise advantage which it is said to involve. To our unlearned judgment it would seem that the whole point as to competition hangs upon the assumed equality of the articles, where the competition is one of price, or the precise relative value of the articles in other cases. Everything, therefore, implies the capability of the consumer to judge. Were this a matter so easy as the doctrine of political economists would imply, no further trouble would there be about the adulteration of food. The public do not possess the capacity for judging.

The remedy may be discovered: we only say that it must be found,—to allow of the operation of the supposed beneficial principle of competition. Now, as to artists' competitions, there is no material difference here from the case of competitions in articles of food—or rather, we believe, that in the case of architects' competitions, the perception of relative merits is attended with extraordinary difficulty. That the most fortuitous combination of knowledge and acquisitions is necessary in the architect, we need not here observe; and to secure this in the judges, along with freedom from bias, and judicial ability—along with the devotion of the enormous time required to examine properly hundreds, or perhaps thousands, of drawings, and sheets of description,—from their form as well as their number most inconvenient of examination,—is what we believe has never been accomplished in any case. We can understand it might be maintained that after all possible improvement, a perfect system could not be reached, and that architects themselves might prefer to accept the balance of the situation. Our point, however, is that such amendment *has to be made*. At present a mass of competitors give of their time and money largely, for no benefit to themselves. True, if there were always a public exhibition, and open during a proper length of time, benefit to many deserving competitors would eventually result, and great advantage from the comparison of ideas would accrue to the whole number of artists and competitors; and some of these latter points have been adverted to in the *Builder*, in the course of a recent review of drawings which were sent in for proposed barracks, &c.; and in the same journal it was suggested that it would be desirable, and a thing due, to lithograph the designs, or the bulk of them, and present copies to each competitor,—and something of this sort, we hope, will be taken into consideration in the case

of the competitions which we have in this notice more particularly had in view. But, there are many other points which, in justice to competitors, and for the successful result of the competition in every respect, should be considered; and we discover no adequate desire to get, as to such points, the views of those whose attention has been most directed to them,—those individuals being not necessarily the older members of the profession.

Reconsideration of the proposed instructions as to the Palace of Administration is, we think, absolutely necessary. The time allowed for the preparation of the general design—for such it must be, and more than a "block plan"—is manifestly too short; and it seems a singularly illogical and ill-advised proceeding to ask for complete designs for the War-Office and Foreign-Office, proposed to be placed between Downing Street and Charles Street, or at one corner of the whole ground, at the same time as the "block plan," or before the latter has been considered and decided upon. As to the admission of foreign competitors, we will make no observation, further than that the idea seems based on the assumption that English architects are inferior to those of the Continent. We need not defend our countrymen more than by reminding all who are interested in the question, how much the architect's work is necessarily dependent upon the manner in which the architect is employed; and in this particular, the contrast between the public works of England and the Continent is unfortunately very great. There are towns in England, however, where private patronage is exercised intelligently, and without undue restriction and interference, and where the Art of Architecture could lay claim to high national distinction.

The importance of the whole subject of competitions was never so great as it is at this juncture. The present case is the forerunner of others, in which Government will make or mar the Art of Architecture—now, in spite of all disadvantages, in no hopeless state in the country, and it will become the precedent for private companies and corporations.

CORRESPONDENCE

FROM THE
UNITED STATES.

HISTORY OF ART IN BOSTON.

DEAR SIR,—I have spoken of our three great Atlantic cities—New York, Philadelphia, and Boston—as the Art centres in the United States, towards which all the talent of the land converges for development, or whence it radiates for employment. Of these three, Boston—in whose nursing arms much of the civilisation of the New World—its sturdiest populations, wealth, activity, and intelligence, grew up—was once the chief. Sole oracle in every matter of taste and opinion, she drew to herself all intellectual capacity in search of recognition or approval: to her came the foreign artist, venturing westward in quest of fortune; and the native tyro, eager to try his young wings.

Excepting only a Scotch portrait-painter, John Watson, who established himself at Perth Amboy in New Jersey, in 1715, the first artists in America, of whom we have any memory, lived and laboured in Boston. These pioneers were of course from beyond seas—from your own English shores—and we have a grateful remembrance of your good timely help, though it was really so slight that, with our first native effort, it was no longer needed; and though we have since repaid you a thousand-fold—seducing you, for your Watsons and others for whom you cared not, our Wests, and Copleys, and Leslies, and Newtons, whom you delight to honour.

The first and best of these early painters, whose brief and humble history makes the initial chapter in the story of American Art—the scene laid here, in Boston—was John Smybert, who accompanied Bishop Berkeley, with the "course of empire," westward in 1728. In a picture of his, representing the landing of his patron's party, we have our first historical canvas—the first, at least, ever executed here in which there is more than a single figure. Smybert, though a man of only moderate ability, did more than merely supply the demand for Art-production in his day. He left

behind him, as none other of his fellows did, an influence which worked for good in the professional education of those who came after him. In his pictures there were incentive and examples to Copley, Trumbrell, Stuart, and Allston. "I am," said Allston once of a copy of a Vandyke by Smybert, "grateful for the instruction it has given me." Trumbrell, when he left the revolutionary army in 1766, set up his easel in Smybert's apartments, in which there were still many of his pictures. Smybert is referred to by Walpole, in his "Anecdotes," as a modest man, earnestly and sincerely devoted to his art.

Smybert's most skilful colleagues in the immortalising of the magnates and the beauties of his time was a Mr. Blackburn and others, in Boston; Mr. Watson (already mentioned), in New Jersey; Williams, in Philadelphia (gratefully remembered, for his counsel and encouragement, by West); Fels, Green, and others, in Pennsylvania and Newport; and Theus, of Charleston, in South Carolina.

At a somewhat later period, the art of engraving was practised in Boston, for the first time in America, in the hands of Nathaniel Hurd (1764), of Paul Revers, and of Amos Doolittle (1771). Doolittle did the earliest American historical plate, in a picture of the "Battle of Concord."

This little band, few and feeble, of missionaries from afar was immediately succeeded by a sturdy native *troupe*, in whose genius American Art sprang with a bound into Pallas-like life and strength. Of this second chapter Boston is still the theatre. It begins—and certainly it is a brave beginning—with the lives and works of Stuart, and Trumbrell, and Copley, in Boston; supported by West, in Philadelphia, and by Peale, in Maryland. Of these men but little is left for us to say here, after all which is familiar to all of them and of their genius. Of two of them, indeed (West and Copley), more should be known to you than to us, since from their early and unbroken association with British Art, they belong more to England than to America. To Trumbrell the nation owes the embodiment of many of the chiefest scenes and incidents in its history, and the artists many invaluable and enduring examples and teachings. The works of Gilbert Stuart, while they illuminate the past, serve equally as priceless lights to the future. Peale (Charles Wilson) will be ever gratefully remembered for his professional labours, and still more for those many accessory toils in which his active spirit and his Art-love kept him unceasingly employed. It is to his industry and enterprise that we owe our Museum Collections, and perhaps our Art-Academies. Certainly the first efforts to supply schools for the study of the antique and the living model were made by him, though his ventures were lost—all for the very simple and natural want of students to use them! Still it was the bread, no doubt, which he thus and then cast upon the waters that we are now eating after many days.

Ending here this hasty mention of the second period in the history of American Art, we come—still partly in Boston—to the third; and thence, so insensibly to the fourth and last, that it is difficult to make the dividing line. To this division there may be set down (though many, indeed most of them, are still living and toiling) Harding, Alexander, Fisher, Allston, Frothingham, Greenough, and King, in Boston—leaving Leslie and Stuart Newton to your London muster-roll; Sully and Peale, in Philadelphia; and Durand, Inmans, Merse, Vanderlyu, Ingham, Cummings, Dunlop, Weis, Cole, and others in New York. The fourth or present period, the scene now quite removed to New York and Philadelphia, is too long in names of repute and promise for more than reference at this time—so the chapter must come in by and by. I have linked these names, not as peers in professional skill, but as fellow-workers, all labouring in the measure of their strength, and for such labour gratefully remembered and honoured.

Of the Boston painters of this period, Chester Harding and Francis Alexander are still actively occupied, after a long and most successful service, in portraiture; so Alvan Fisher, in landscape. Charles B. King, whom I should have mentioned in my last letter from Rhode Island, is a native of Newport, in that State. His early life was passed in Boston, but he has for many years past been popularly and fashionably employed as a sort of court-painter in

Washington. Frothingham, born near Boston, and long practising his art there, has been for years past a resident of the vicinity of Newport. Horatio Greenough, one of the most eminent of our sculptors, and the first whose genius was given to the glory of the national fame in Art, was born in Boston in 1805, and here too he died only a year or two since. His "Chanting Cherubs,"—executed to the generous and appreciative order of the novelist, Fenimore Cooper,—apart from its intrinsic worth, is most interesting as the first original group from an American chisel. "Greenough," says Emerson, in his "English Tracts," "was a superior man—ardent and eloquent, and all his opinions had elevation and magnanimity."

Allston, in popular esteem the greatest among our painters, was a native of Carolina; but the glory of his professional achievements belongs to Boston, where he passed his life. It was his fame alone which for years kept up the old Art-reputation of his adopted city, in rivalry with its own decay and the growing renown of Philadelphia, and more especially of New York; and when he died, Boston ceased to be—in respect to the numbers and genius of her painters, at least—the "Athens of America." Let her people see to it, that her proud boast be not forfeited for ever, or that it shall belong only to a brilliant past. Let them set generously and earnestly to work, to discover the smouldering embers of Art-life on their ancient hearths, and to fan them into the glowing vitality which is now stifled by neglect alone.

The universal complaint of the Boston painters at the present moment is, that Art is dead, or dying in their midst; and that the people do not know or care what they are about. Half of them are sighing for a more genial and appreciative home; and not a few have lately removed, much to their advantage, to New York, or to other cities. This depressing state of affairs you must not imagine to be the fault of the painters themselves: on the contrary, they are a young, and gifted, and earnest, and brave brotherhood, labouring and waiting patiently and manfully. Among them there are at least half-a-dozen excellent landscapists who, however successful they may be, will never reach the full development of their powers in the stultifying influences of the æsthetic east wind which now surrounds them. In the studio of a crayon-artist here, I have just seen some female heads of wonderful refinement and subtlety of feeling. And yet I am told that his sitter's chair is not half occupied—even at half the price for which it would be eagerly sought elsewhere.

Some seven or eight years ago, there existed here a society called the "Boston Artists' Association," to which the public was indebted for the new pictures which each season gave life to the old exhibitions of the Athenæum. This good office is now done by a smaller and quite informal organisation known as the "Artists' Club." It is the only Art-society proper, of which the city can boast. The Annual Exhibition by this association of current works, got up as usual in connection with the permanent Gallery of the Athenæum, is a very interesting display. The Athenæum is an ancient and well-to-do establishment, occupying a large and imposing edifice, with a creditable library and reading-rooms, a good collection of statuary and casts below stairs, and well-appointed exhibition galleries above. Among the pictures in the possession of the "Athenæum" is Trumbull's "Sortie of Gibraltar," and his "Priam receiving the dead Body of Hector;" one or two Allstons; portraits of Webster and others, by Chester Harding; Stuart's original study for his portrait of Washington, and of Mrs. Washington, with other works; Ary Scheffer's "Count of Wirtemberg lamenting over the dead Body of his Child;" pictures by Sully, Copley, Rembrandt, Peale, Leslie, Neagle, Weir,—together with a Titian, a Poussin, an Andrea del Sarto, a Velasquez, and sundry old masters more or less aged. Among the pictures indefinitely "loaned" to the gallery are the five grand landscapes by Cole, representing the "Course of Empire"—first in the savage, and then in the Arcadian or pastoral state; then the commencement and the glory of empire, and finally its destruction and desolation; numerous works, poetic, historie, and landscapes, by Allston, among them the grand "Belshazzar's Feast," which, after nearly thirty years of occasional labour, he left at last quite unfinished.

This bold work the artist faced with the encouragement of a commission of ten thousand dollars, subscribed equally by ten or more gentlemen of Boston. He could not possibly have undertaken it at the time he did without such certainty of sale; for, at that period, no artist could provide bread for himself by painting works of the imagination alone. Once when I was alluding to this fact, *à propos* of a mention of Allston,—“Yes,” replied my friend, “most true! Indeed, Allston himself may be said to have lived for a quarter of a century on ‘Belshazzar’s Feast!’”

But, returning to my catalogue, I should mention among the loans, indefinitely or for the season, the fine picture of the "Chorister's Consolation," and the "Daute and Beatrice" of Ary Scheffer; a portrait by Stuart Newton; some pictures of horses, by Rosa Bonheur; "Love's Torch quenched," from the pencil of Angelica Kaufman; Sant's "Fortune-teller," among the last year's prizes of your Loudon Art-Union; two pictures by Toemmes, a German; a "Stable Scene" by your own Herring; something of Claude, of Carlo Dolce, of Teniers, of Gerard Dow, of Canaletti, and of Greuze.

The artists of New York and other cities contribute liberally to the Exhibition, their works making one of its especial features. This contingent includes characteristic and clever examples of Lilly, M. Speucer, Huntington, Gray, Chapman, Rossiter, Page, Cropsey, Kensell, Church, W. Hart, A. D. Shattuck, Edwin White, Edmonds, E. D. E. Greene, A. F. Tait, G. L. Brown, F. B. Carpenter, Paul Webber, Terry, Samuel Laurence, Vincent Colyer, W. J. Hays, W. Heins, Durley, Stillman, Gijnoux, Bontelle, and Johnston.

The Boston painters are themselves nearly all fairly and well represented on the walls:—Champane, Gay, Gerry, Williams, and Frost, in landscape; and Pope, Amet, Hoyt, Ordway, Childs, Wight, Willard, Hartwell, Hueckley, and Wilson, in figures and portrait.

In the statuary hall of the Athenæum there are numerous works of Greenough, statues, busts, and bas-reliefs; a bust of Webster, by Powers; the "Orpheus" and the "Hebe," and "Ganymede," of Crawford; "Avengers," Allston; Ball Hughes' "Uncle Toby and the Widow Wadman;" Stephenson's "Dying Indian;" Mackett's "Shipwrecked Mother and Child;" a cast of the statue of Marshall's "First Whisper of Love," lately presented to the Athenæum by the London Art-Union; a statue of the late Judge Story, by his son; some originals and copies of Canova; and numerous casts from the antique. Most of the works I have mentioned here are originals, in marble. Many of the sculptors are natives of Boston, the city taking better care of that art than of painting—very possibly because the "marble people" live abroad, and are thus invested, or are so supposed to be, by that prestige of foreign approval, so acceptable to our people in their characteristic respect for authority. This same humour of deference to venerable opinion has sorely afflicted Boston from the earliest antiquity until now with the old-master mania. The private galleries are stifled with their blackness of darkness, with here and there, of course, a ray of purest light. American Art is not as much in vogue here as in other places, since Boston holds yet to the exploded fancy that "nothing good grows in Nazareth;" nothing—unless it be the exception which I have already made, of sculpture. In this department, perhaps, the city may regain its old Athenian repute; for next week famous honours are to celebrate the erection in its streets of a colossal bronze statue of "Franklin," modelled by Henry Greenough, a brother of the late sculptor Horatio. And the people are seriously thinking of persuading Mr. Crawford (already occupied with extensive commissions from the national Government, and from Virginia) to make a colossal equestrian statue ("on horseback" one of the Boston papers says), to embellish their beautiful "common." In addition to all this, they are speedily expecting the arrival of a grand bronze statue of Webster, which they some time ago entrusted to the genius of Mr. Powers.

I have reminded you before of our remarkable achievements in this high art, and the symptoms of a marble and bronze epidemic, not in Boston alone, but the land over, are daily increasing. There is in statuary a tangible actuality and substance which suits our love of the real, and in which we can see,

in a degree, the "worth of our money." Luckily, the good taste of our people in this regard, and the true genius of our sculptors, assure us that it will be in any case "all right."

I shall, at some more fitting time, tell you of Boston as the heart of our chief manufacturing interest; of the great mills of Lowell, of Lawrence, of Manchester, and of many other surrounding hurly-burlys of ingenuity and industry. In a few days they will speak for themselves in the annual display of the Massachusetts Charitable Mechanics' Institution, now on the eve of its Eighth Annual Exhibition. This fair, and similar ones in New York and other cities, are always very successful in the arrangements and in the results. As a means of instruction and development in Manufacturing-Art they are becoming a very important power.

T. A. R.
Boston, Massachusetts, September 8, 1856.

ART IN CONTINENTAL STATES.

PARIS.—Death has recently taken from us two artists of considerable talents, though in different styles of art—Theodore Chasserain, born in Samana (Spanish America), of French parents, died at the early age of thirty-eight; he was a painter of distinguished merit, and has executed many large government works, amongst which the principal are in the *Palais du Conseil d'Etat*, *Quai d'Orsay*, and the cupola of the Church of *St. Philippe du Roule*; his finest picture in the grand Exhibition was "The Defence of the Gauls under Vercingetorix." This artist began in the style of his master, Ingres, and, like him, painted particularly cold and colourless. Of late years he made a most remarkable change in his style, imitating De la Croix rather than his first master, which is the more remarkable, the styles of the two being the extremes. He was a young man of much promise, of great urbanity and kindness, and will be regretted by all who knew him, or had any dealings with him.—The other artist deceased was Jacques Christopher Werner, painter to the Museum of Natural History at the *Jardin des Plantes*, a man of considerable talent, and also much esteemed by his contemporaries: he died at the age of fifty-eight.—The provincial museums continue to be enriched by the various contributions of the vast resources of the Louvre; these mines of pictorial wealth seem inexhaustible!—A fine copy of the "Descent from the Cross," by M. Maindron, has been placed in the Church of St. Gervais; it is beautifully executed.—The *Château de Blois* is at present under restoration, and advances rapidly.—M. De Bay, senior, Conservator of Antiques at the Louvre, has received from the King of the Belgians the decoration of his order.—A statue by Etex has been erected at *Lons-le-Saulnier*, to the memory of General Lecourbe: it is colossal, and in bronze.—An exhibition of works of Art is decided upon for next year; it is intimated that it will take place in the Industrial Palace, *Champs-Élysées*, the upper part of which will be suitably arranged for the display of the contributions: it is to open on the 15th of May, and to close on the 15th of July.—A statue of Jeanne d'Arc, by M. E. Paul, has been temporarily placed in the *Champs-Élysées*.

BROTHERHOOD IN ART.—A proposal was issued from Düsseldorf last August, signed by most of the distinguished artists resident at that place—as Lessing, Hess, Michel, the two Achenbachs, Krause, Volkhardt, and others, inviting a general convention of German artists, to be held at Bingen on the Rhine, with a view to the establishment of friendly intercourse and mutual acquaintance. We have not heard the result of the proposal, but it was very favourably received. Invitations were sent to and accepted by King Louis of Bavaria, and Prince Frederick of Prussia. What a contrast this presents to the condition of Art-society in our own country! Certainly the artists of no other nation are so divided among themselves as the members of our school. The establishment of provincial meetings for social intercourse has often been attempted, but the results have always been miserable failures. Upon every occasion of so-called social assemblage at which we have ever been present, whether it be dinner, *soirée*, or business-meeting, Trafalgar Square does not recognise Suffolk Street, or Langham Place; and between Pall-Mall and Pall-Mall East there is little intercourse. We cannot imagine such a thing as social intercourse between members of our different institutions, and yet why should it not be? why should jealousy or presumed position continue to separate them?

BRITISH ARTISTS: THEIR STYLE AND CHARACTER.

WITH ENGRAVED ILLUSTRATIONS.

No. XX.—FRANK STONE, A.R.A.

ALL the pleasure one receives from the contemplation of a work of Art is derivable from its association in the mind with our ideas of the true, or the expressive, or the beautiful, either in sentiment, form, action, colour, or in all these united. Art, like speech, is the expression of thought; but speech falls inaudible upon the deaf ear, and finds no sympathy in the heart that echoes not back its meaning—is not responsive to it: so Art is appreciated only by those who feel its awakening influences, but only in such a manner, or in such points, as commend themselves to the taste and feeling. In using here the term

"appreciation," we would entirely disconnect its meaning from the power of judging of matters of Art; this opens up another line of argument altogether, which we do not care to enter upon at present: we would simply infer that a picture, a statue, or any ornamental or decorative object which affords pleasure, does so because it makes its appeal successfully to the mind, and, in the case of the learned, to the understanding also. Yet even in

instances of the latter how different are the opinions entertained! one man admires a Raffaele, and sees nothing he considers worthy of regard in a Teniers

or a Metzù; another man hangs his room with pictures of the Dutch and Flemish school, and is wholly indifferent to the finest productions of the Italian masters. Some are delighted with bold, striking, and sublime subjects; others with what is suggestive of beauty and repose: the eye of each being satisfied with the element or quality of excellence which best agrees with his spirit or taste—taste being, in its primary considerations, the result of feeling. A recent American writer thus describes the operations of Taste on minds differently constituted, or rather, it should be said, on minds comparatively ignorant of the truths of Art, and on those who have been educated in them:—"There is no more certain test of good taste than the involuntary selection of subjects by the eye on viewing for the first time ornament in objects of Art. Nature works on so large or true a scale that few judge her amiss. That which is majestic, noble, picturesque, or simply beautiful as a whole, classes itself at once in all minds, and the fact of a common decision on these points demonstrates the genuineness of the laws of Taste. The common mind differs from the cultivated in its knowledge and appreciation of Nature's beauty in detail. The former sees only partially; the latter grasps the whole, and distinguishes the parts; nothing, however humble, which goes to make up the chord of beauty, escapes its notice. Where the appreciation of the one ends, the pleasure of the other is but begun; so that his delight is as true and as final as Nature herself. The natural eye, therefore, sees all things as in a glass darkly—the cultivated penetrates the film of Nature, and looks into her heart."

Now may not this train of thought be carried from Art generally to the works of individual painters? We believe it is too much the practice to unfairly criticise and condemn a painter simply because his works are not fashioned according to our taste, or in exact harmony with our own feelings, forgetful that to others, as well capable as ourselves of coming to a right decision, they may embody all that is excellent; and when we do so how great injustice is committed. Another ground on which this superstructure of erroneous judgment is raised is, that hastily rejecting, at a glance, perhaps, what is represented, we take no trouble to ascertain what are its merits; we give to it neither close examination nor

BASSANIO RECEIVING THE LETTER CONCERNING ANTONIO.

[Daniel Brothers.

patient study; we are unwilling to recognise and accept the spirit which created and formed it, and consign to neglect, or, worse perhaps, publicly condemn, a work of genius, merely because we chance to have an "unwholesome preference" for some other. Suppose such a principle of feeling and action were transferred from the world of Art to that of Nature, we then should have one man arraigning the wisdom of Providence because the sky is not always blue, and another because the sunshine is frequently dimmed by "fleecy clouds;" one because the surface of the earth is not an unvarying extent of gentle slopes and verdant meadows, another because it does not exhibit a continued succession

of lofty mountains and rugged precipices. The proof of true taste and a right and kindly spirit lies in the desire and ability to discover beauty or excellence under every guise, without prejudice or undue partiality. The first effort of the critic should be directed to the divesting himself of every impediment that may hinder his arrival at a just, *reasonable*, and correct conclusion.

Again, we should accept the artist for what he is, and not repudiate him for what he is not, nor pretends to be: the charlatan, who assumes a position for

* "Art Hints." By J. J. JARVES. S. Low and Sons, London.

which every one sees him to be disqualified, is a fair mark for popular indignation; but the man who so knows himself as to keep within his own proper limits, and to ask from the public sympathy and attention nothing more than what he is entitled to, demands and gains the respect due to him. Men of great and surpassing genius are not created every day; they are the *rare aves* which Nature produces at long intervals of time to stand as examples to the world at large of the ennobling gifts she is able to bestow, and as suns in the intellectual hemisphere round which the lesser lights may revolve, but whose brightness they can never equal, much less outshine. Such men are raised up for the wonder and honour of the nations of the earth, to be followed and imitated, though it will ever be at a far-off distance. Painters, as well as poets, philosophers, orators, and all other kindred minds, must be measured each according to his degree of intelligent power; and it would be as absurd to condemn Addison or Akenside, because the one had not the gifts of Milton, and the other of Shakspeare, as it would be to ignore the works of a second or third-rate artist, because Nature had denied him the genius of Raffaele, Titian, or Tintoretto.

We have been led into these observations by the frequent unjustifiable comments made in our hearing upon the pictures of many living artists. Critics, or those who assume to be, are too apt to draw comparisons that ought not to be made, and which it is ridiculous to make, inasmuch as such works have no right to be placed in juxtaposition with others with a view to comparison. And even where no comparison is instituted, the artist is judged by what he does not pretend to be, and not by what he is. It is assumed he ought to be some-

thing more than he is, when it is self-evident Nature never intended him for anything but what he shows himself—never endowed him with extraordinary gifts: it ought to be sufficient for us if he acts up to the light he has received. Mr. Stone is one among several painters we could name who have been the subjects of much unfair criticism; his merits are too generally overlooked in the sweeping condemnation pronounced on the "sentimentality" of very many of his pictures. No one would declare these works to be significant of great genius; we confess to set but little value on them as productions of an enlarged and intellectual mind, but still we are not insensible to many excellences which they undoubtedly are privileged to claim.

We are unable to give our readers any information concerning this artist's early life. We have never chanced to hear anything about him; and all our efforts to afford our readers such a biographical notice as might be agreeable to them have been fruitless. All that we have heard—and this we cannot vouch for—is, that he came to London about twenty years since, from the neighbourhood of Manchester. He made his *début* as a portrait-painter by sending to the Royal Academy in 1837 two portraits, one of which was the "Lady Seymour." In 1838 he contributed a "Study," and in 1839 three portraits—one of them "Lord Goderich," and another a portrait of the "Hon. Mrs. Blackwood." It would therefore seem that he brought with him some good introductions, which his talent enabled him to turn to a profitable account, for a time at least. In 1840 he contributed to the British Institution a graceful little picture of a young girl, under the name of "Louise." Having, it may be presumed, suffi-

THE IMPENDING MATE.

[Daniel Brothers.

ciently tested his powers in portraiture, he now stood forth on a wider field of action, and sent to the Academy in the same year a "Scene from the Legend of Montrose"—the passage which describes Annot Lyle, like David laying with his harp the evil spirit of Saul, soothing the fiery temper of Allan M'Aulay by her song, in the presence of the Earl of Monteith. The picture was an earnest of a talent which, had it not shortly afterwards been diverted into another and far lower channel, would, in our opinion, have placed the artist in a more elevated position than he has ever attained, or ever will attain now, it is to be feared. In 1841 he exhibited at the British Institution another picture, which few of his subsequent works have surpassed in true poetical feeling and careful execution. The recollection of this work, and of three or four others to which we shall hereafter refer, causes us the more to regret he should ever have cast aside his "first love." This picture is a scene from the poetic romance of "Philip van Artevelde," wherein a youthful husband, "ow'er young to marry yet," amuses himself with a hawk, while his neglected bride stands sorrowfully watching him. It elicited from us the observation, "This is one of the most prominent as well as the most attractive pictures in the collection: it is painted with a master hand." To the Academy Exhibition of the same year he sent another most graceful composition—"The Stolen Interview of Charles, when Prince of Wales, with the Infanta of Spain."

In 1842 Mr. Stone commenced the series of "love-pictures," which, however popular they have been made by the engraver's art—so popular, or at

least so common, as to be seen here, there, and everywhere, wherever a print-shop of any kind exists—were, unhappily, the means of turning his thoughts too often in a direction that has certainly not proved the high road to a good and lasting reputation. Popularity is not necessarily a test of merit in Art, neither does merit always win the suffrages of the many; for the multitude, incompetent to exercise sound judgment, is swayed by caprice, fancy, fashion, and various other motives. The pictures to which we refer possessed that peculiar attractiveness which was almost sure to command a large amount of admiration from those who are readily pleased with pretty faces, elegant figures, and a certain kind of sentiment that is patent to the most casual and careless observer. But such compositions never rise above mediocrity, however well they are put on the canvas—and undoubtedly Stone presented them in a manner which few of his contemporaries could excel, regarding them merely as examples of careful and brilliant painting. Yet in contemplating them one learns nothing but the fact that much technical skill and labour have been thrown away upon subjects so unworthy of what it must have cost to produce these works. The great ends of Art—the instruction and the elevation of the mind—are here unequivocally lost sight of, and that which should "point a moral" scarcely "adorns a tale," or, at least, a very indifferent one. If we compare such compositions as "The Last Appeal," and "The Course of True Love," with the most simple landscape placed by the side of either, how low do they fall beneath it as an expression of real worth, or as a medium of intel-

ligent communication between the material world and the mind. The landscape, though it may chance to be little else than a bit of meadow-land, a clump of weeds, a silvery thread of running brook, all o'er-canopied with a sky whose brightness is chequered by a few light clouds, at once lifts the thoughts of the contemplative mind

"To Him who formed our world, and poured forth glory on it."

From the coquettish maiden and the love-sick youth we turn as from a matter which concerns none but themselves; which they might settle satisfactorily, or otherwise, in some quiet, unseen nook or corner by themselves, and which, though perhaps true to nature as an incident of common occurrence, elicits neither sympathy, nor pity, nor sensation of any kind from the spectator: one has only to fancy himself the actual witness of such an incident to arrive at a just estimate of its value when transferred to the painter's canvas.

The first of this class of pictures was exhibited at the British Institution, in 1842, under the title of "The Bashful Lover and the Maiden Coy;" it was followed the same year by another at the Royal Academy, "Admonition,"—a work perhaps to which less exception might be taken than to some others, yet partaking of their character: it represents two young girls, one of whom holds a love-letter, it is presumed, in her hand, while the elder is venturing to give her sister a lecture upon the impropriety of receiving such a communication. In 1843 the artist sent to the British Institution two pictures, each of a single figure, one called "Helena," the other "Nourmahal;" and to the Academy

"The Last Appeal," a picture too well known to require explanation. He contributed to the British Institution, in 1844, a costumed portrait of a lady, to which the title of "Retirement" was appended, and to the Academy "The Course of True Love never did run Smooth," the large engraving from which was published with the title of "Cross Purposes," as more comprehensive and explanatory of its meaning than that adopted by the painter. "The Ballad," exhibited at the Institution in the following year, is a charming little picture of a girl reading beside a water-spring: the feeling, sentiment, and execution of this gem deserve all praise. To the Academy Exhibition of the same year he sent a pair of lovers, under the somewhat affected title of "*Ce n'est que le premier pas qui coûte*,"—a title which suggests the idea that the artist was beginning to find himself at a loss for a name wherewith to distinguish his "love-pictures." But a work of a far higher order than any we have yet referred to was hung at the same time—a scene from "HAMLET"—Ophelia singing before the queen as the king enters; a composition that may lay claim to some of the best characteristics of good historical painting.

In the Royal Academy Exhibition of 1846 was a picture by Stoue, suggested by a line from Byron—

"Soft hour! which wakes the wish and melts the heart."

An Italian noble, rather advanced in years, is seated on the terrace of his villa, overlooking the sea; near him is a young girl, and beyond them is a youthful pair, no doubt "discoursing most eloquent music" in each other's ears; it is

MATED.

[Daniel Brothers.

the old story, but told in so happy a manner as to render it most acceptable: it is one of the few pictures of the class which we should be proud of possessing.

"The Approaching Footstep," exhibited at the British Institution in 1847, is a graceful, unaffected picture of a girl, in the costume of the last century, reclining on a bank, in the attitude of listening,—

"Some well-known step salutes her ear:"

a small lap-dog the lady holds in her arms appears as eager to welcome the comer as its beautiful owner. The same year appeared at the Academy the two pictures, "THE IMPENDING MATE," and "MATED," here introduced as, perhaps, the most agreeable of these particular compositions, as they are happily among the last we shall have to notice especially; for, with two or three unimportant exceptions, from this time a decided change for the better came over the spirit of the painter's dream; he had before essayed his powers to rise higher, and found his strength equal to his flight; it henceforth increased with action—*vires acquisivit eundo*. We are glad to have our own thoughts also turned into another direction; one wearies with the tales of love, and even with the faces of the same pretty models always before the eyes.

It was perhaps not the most judicious act of the painter, to pass at once from such subjects as those to which we have referred, to that which he exhibited at the Academy in 1848,—"*Christ and the Sisters of Bethany*;" it takes some time for the mind to be imbued with the devout spirituality essential to the

perfect illustration of sacred history—especially a subject like this; and we were therefore not surprised to find it a comparative failure, showing, indeed, many valuable qualities of Art, but most deficient in the severity and simplicity that ought to characterise works of this class: nevertheless, it was a most acceptable and agreeable change from what we had seen from the same hand.

Two small pictures sent to the British Institution in 1849, "*A Girl of Brittany*," and "*Alice*," are very skilfully executed studies, free from all affectations. "*The Duett*," exhibited at the Academy in the same year, represents a modern drawing-room, with a group of young people, two of whom are at the piano: there is much refinement of taste in the conception of this picture, and it is very highly finished.

"*Sympathy*" (British Institution, 1850) displays in the treatment of the subject feeling of a right and genuine order; the figures are those of two young girls, one of whom offers words of consolation to the other, whose countenance betokens both bodily and mental affliction. Mr. Stone's contributions to the Academy, in the same year, were "*The Gardener's Daughter*," and "*A Scene from the 'Tempest'*"—Miranda expressing her admiration of Ferdinand.

During the last six years, we find the name of this painter only twice in the catalogues of the British Institution. In 1851, when he sent two small pictures, one called "*The View*,"—two children, one directing the attention of the other to some distant object; the second a study of a girl, with the title of "*Blanche*;" and in 1854, when he contributed "*The Balcony*," the name given

to the head and bust of a small female figure. In the former of these years, he sent to the Academy the picture which is engraved on the first page of this notice, "BASSANIO RECEIVING THE LETTER ANNOUNCING ANTONIO'S LOSSES AND PERILS," from the "Merchant of Venice," one of the most ambitious works attempted by the painter, and certainly not the least successful; the composition is good, the figures are well grouped, and the heads carefully studied with respect to character, while the whole is painted with a brilliant and delicate pencil. In the autumn of this year Mr. Stone was elected Associate of the Academy.

Stimulated, perhaps, by the honour paid him by the Academy, he sent to its exhibition in the following year four pictures, the largest number he ever contributed:—"A Scene from Cymbeline," a small canvas, presenting half-length

figures of Pisanio and Imogen; a "Country Girl;" "At the Opera," a title significant of the subject; and a "Portrait of Dr. Hooker," surrounded by his native collectors, examining plants in the Rhododendra region of the Himalaya Mountains,—a subject not of the highest pictorial interest, but treated with considerable skill and judgment. His contributions in 1853 were—"A Nile-Flower," a charming study of an Eastern maiden; "Now I'll tell you what we'll do," an affected title given to a group of country girls, grouped in a meadow; and "The Master is come," illustrating a passage in the history of Martha and Mary, as described by the Evangelist St. John: the two females only are introduced, and they are described with much power and truth.

Three pictures were also contributed by the painter in 1854:—"The Mussel Gatherer—Time to go," rather a novelty from his pencil, for it is a coast scene,

OPHELIA: A SCENE FROM "HAMLET."

[Lalziel Brothers.

with a real sea-side maiden—not a young lady habited in the dress of a fisherman's daughter—with as much refinement of expression and delicacy of skin as we should expect naturally to find in one who is daily called to face the "briny blasts;" the figure is vigorously painted, yet with the artist's usual careful finish. The second, called "The Old, Old Story," is Mr. Stone's old, old story; but the French maiden, and her admirer, a young fisherman, tell their tale of love to the spectator in a sensible and pleasant manner: here is true nature—not affectation; and the style of the painting is as true and substantial as the narrative that is set before us. The third, "Castle Building," represents a girl in the attitude of earnest meditation; no doubt her thoughts run upon "the old story;" at any rate they have not disturbed the sweet expression of her face—one of the sweetest and most life-like we remember to

have seen on canvas. In 1856 Mr. Stone was absent from the walls of the Academy; and in the present year he sent one picture only, "Doubt," a work of considerable size, but certainly not an advance upon previous performances.

The characteristics of Mr. Stone's productions may be briefly summed up: his strength lies in his delineation of the female figure, where beauty of expression and delicacy of texture are sought after: he rarely attempts elaborate compositions, aware, probably, of his weakness in the art of grouping masses, either as principals or accessories. His colouring is generally truthful, and always brilliant, and his execution careful, even to a high degree of finish in the minutest details of his subjects. His talents will always command respect, though we do not anticipate they will ever cause him to be classed with the brightest ornaments of the British School.

THREAD AND FIBRE GILDING.

THE pressure on our columns arising from the imperative claims of the exhibitions of the season, and other matters directly connected with the Fine Arts, has compelled us to postpone until now our remarks on a paper read by Mr. Bennoch, of the firm of Bennoch, Twentymen, and Rigg, of 77, Wood Street, Cheapside, at the Society of Arts, in April last, "ON THREAD AND FIBRE GILDING."

The subject is one of national importance: and if the remarks of Colonel Sykes, the Chairman of the East India Company, who presided on the occasion, and took part in the discussion, are duly weighed by the manufacturers of England, it would appear that the process of gilding described by Mr. Bennoch may open up a demand in the East for fabrics adapted to the tastes of the people, that may go far to neutralise the inconvenience now felt by the commerce of England in consequence of the excessive shipments of silver to India and China. Whatever portion of such demand can be supplied by the looms of England will be a national advantage.

We transfer to our pages a large portion of the interesting paper, and trust our manufacturing readers will look into the matter, and ascertain for themselves whether they cannot to some extent carry out the suggestions we have offered. Since the paper was published in the *Journal of the Society of Arts*, considerable discussion has been excited on the subject. By command of Her Majesty the specimens exhibited when the paper was read were forwarded to the Palace, and some of them selected by Her Majesty, who, through Colonel Phipps, was graciously pleased to express her admiration of the fabrics.

Waistcoat-pieces and material for neck-ties have been produced by Mr. Sanderson, the enterprising silk manufacturer of Gresham Street, City; while Messrs. Kerr and Scott, the eminent shawl manufacturers of London and Paisley, are preparing specimens in their branch of manufacture, which we cannot help believing will become popular on all occasions of full-dress display. Some shawls made in France have struck us as exceedingly chaste and beautiful; while there is to the fullest extent all the effect producible by the purest gold, there is an absence of that objectionable glitter and glare peculiar to mere tinsel. Those who wish to thoroughly understand, not only the new system, but also the process that has obtained for thousands of years, we confidently recommend to read the following remarks read by Mr. Bennoch:—

ON THREAD OR FIBRE GILDING.

When he consented to write a paper on the subject, he had resolved to confine his observations within the narrow limits of certain recent discoveries, in which he had become interested; but he soon found that, however interesting a paper so limited might be in itself, it would necessarily leave untouched the large and important subject of fibre plating, or covering threads of silk or cotton with gold or silver, so that the precious metals might be used with facility in the manufacture of gold and silver tissues. To clearly understand the several processes required for the production of such fabrics, it became necessary that he should refer to other and apparently distinct branches of industry, such as silver gilding and wire drawing. He therefore resolved to investigate the general subject, and bring the result of his inquiries within the space of a single address.

The history of ornamental jewellery from the earliest times—the purposes it had served—how and why rings, and chains, and bracelets, and wreaths, and erows, became and continue indispensable ornaments, would form an instructive paper, but his duty was to confine his remarks to the production of threads used in the manufacture of woven or embroidered fabrics.

Innumerable references are made in the sacred writings to the liberal use of gold and silver, not only for personal adornment, but also for the highest ceremonial purposes.

In the Old Testament we are told (Jer. chap. x. v. 9), "Silver spread in plates was brought from Tarshish, and gold from Uphaz, the work of the workmen and of the hands of the founder. Blue and purple is their clothing, they are all the work

of cunning men." It is evident from this and other passages that fire was used in purifying the metal; that it was afterwards founded or cast into certain forms, preparatory to its being beaten or hammered, and fitted for the purposes for which it was intended.

The first important use made of gold was in the construction of the Ark of the Covenant, and Bezaleel, the son of Uri, the son of Hur, of the tribe of Judah, is described (Ex. xxxi. 2–4) as specially called, and by inspiration "possessed of all wisdom, understanding, and knowledge in all manner of workmanship, and to devise cunning works in gold, and in silver, and in brass, and in cutting of stones to set them." Then (in Ex. xxv. 11) the ark is described as being "overlaid with pure gold within and without."

So in the building of the Temple (I Kings vi. 21, 22), "Solomon overlaid the house within with pure gold, and he made a partition of gold before the oracle, and he overlaid it with gold, and he overlaid the whole house with gold, until he had finished all the house, and also the whole altar that was by the oracle he overlaid with gold."

It is interesting and very suggestive to observe, that, wherever the highest and holiest thoughts and purest motives ought to have existed, and where the objects were of the most sacred nature, the purest of all metals was enjoined to be used, and doubtless intended to symbolise the purity of the purposes to which it was applied. The functions of the priest were the loftiest and purest, and the temple in which he served was designed to last for ever; therefore, the purest metal was adopted as indicative of the purity and endurance of the priesthood and the temple.

After the construction of the ark and the tabernacle we have a description of the garments of the priests (Ex. xxxix. 3):—"And they did beat gold into thin plates, and cut it into wires to work it in the blue, and in the purple, and in the scarlet, and in the fine linen, with cunning work."

As we are not told what breadth the plates were, it would be idle to speculate on the length of the wires. He apprehended, however, that the wires there referred to should not be understood to mean what the word now implied. When they remembered the marvellous particularity with which the minutest details in reference to the building of the temple, the tabernacle, the ark, and the woof of the priestly raiment, were described, he was persuaded that had the gold been drawn into lengthened wires the particulars of the process would have been given. In the absence of such information, and taking the facts as they lay before them, he arrived at the conclusion that the wire mentioned was only narrow shreds of thin gold, which, in all probability, did not in length exceed the width of the web from which the garments were to be made, and these webs need not have been more than a few inches wide. We shall, by-and-by, see that even now in the East certain robes are made of narrow strips, and the fashion may have been handed down from the time of the patriarchs.

From specimens shown it was seen that having succeeded in producing a wire of great length, it was used longitudinally as a warp, avoiding the difficulty experienced when the wire thread is passed from side to side, as in the weft or shuttle.

In covering the sacred places within and without with pure gold, it is not stated how the plates were fastened, and we very naturally, and perhaps truthfully conclude that they were rivetted or fastened with nails. The workmanship was doubtless exceedingly rude; at all events, they were justified in the opinion that had other means been employed they would have been fully described. This view is partly confirmed by the fact that the words "gilt" or "gilding" do not appear in the sacred writings, and there is no data determining the period when gold was first attached by an adhesive medium.

Although the system adopted in the East, and prevailing there at the present moment, may greatly differ from that which existed in the days of Moses, still, in his judgment, there must be some similarity. By ascertaining the method now pursued in India, we may obtain a faint glimpse of the plan adopted by the earliest workers in the precious metals.

The city of Paithun, situated on the river Godavary, is famed for its manufactures in gold and silver tissues—viz., *puggrees*, or turbans, *doppattas*, or long shawls, and *sarees*, or women's robes. The highest

qualities of these several productions are sent to the courts of Gwalior, Baroda, and Hyderabad.

The long shawls which are thrown over the shoulders of the native princes on all occasions of state ceremonial frequently cost as much as 3000 rupees (£300) each. The weft is composed of very fine cotton thread, generally scarlet or green, the warp being of silk of a similar colour. The shawls are sometimes in long strips of about an inch in width, and placed alternately a strip of scarlet and a strip of gold. The ends are of cloth of gold, about a yard in depth, and the whole shawl is surrounded by a rich border of flowers or birds in variegated silks, woven on a gold ground. Some of the sarees are made of thick shot silk in narrow strips, and finished in a similar manner; while others of the same texture, as the *doppattas*, are flowered, spotted, or striped with gold, and are about nine yards in length. They present a most gorgeous appearance, being in texture like the fine muslin gauze of ladies' dresses, and it is by no means uncommon to have them of the value of 225 rupees (or £22 10s.) each.

Dr. Royle, in his instructive lecture* on "The Arts and Manufactures of India," informs us that, "among the references to silk in ancient authors, there is also frequently mention made of gold and silver as interwoven with silk; even the Coan women are represented as interweaving gold thread in their silken webs, and Caligula as wearing 'a tunic interwoven with gold.' *Babylonicum* was the name applied to the splendid productions of the Babylonian looms. These are described as being adorned both with gold and with variously coloured figures. A peacock's train is compared to a figured *babylonicum*, enriched with gold; while *peplum*, the shawl, had the greatest skill and labour bestowed on its fabrication, and various objects were frequently represented on it; that worn by the Pastophori in religious ceremonies was richly interwoven with gold, and displayed various symbolical and mythological figures; while the *paraganda*—a word supposed to be of oriental origin—we learn was the border of a tunic enriched with gold thread, and worn by ladies. There is no doubt that it has long been the custom so to adorn garments in the East; and we had numerous such specimens sent to the Exhibition of 1851."

Mr. Bennoch then referred to the process that prevails in India in preparing the metal and the thread used in the manufacture of these truly gorgeous fabrics.

A rod of silver, weighing twenty-two rupees, or about eight ounces, after having been roughened by a file, is covered with a leaf of the best gold, weighing one rupee, so that gold forms one twenty-third part of the whole metal. The method adopted to make the gold adhere to the silver is very simple. The rod of silver having been wetted, the gold leaf is laid on, and pressed with the fingers, and afterwards rubbed smartly on the thigh. The small portion of gold that may overlap hangs loose, and is cut off; the edges of the gold leaf that come in contact are beaten a little thinner than the body of the leaf, so as to secure, as nearly as possible, a uniform thickness.

The bar so prepared is heated in a pan of charcoal till it becomes redhot. It is then taken out and hammered, and rubbed with a piece of wood, and is ready to undergo the first process of being drawn into wire. The rod is, at this time, about the thickness of a man's thumb, and from six to eight inches in length. In the wiredrawer's house there is a pit dug in the floor, about thirty inches deep, containing a rude horizontal wooden cylinder, or beam, turning on pivots fixed into each end, placed in sockets at the side or end of the pit. In this cylinder are fixed four handspikes, over one of which is slipped a ring, to which is attached a chain, with a ring at the other end. Through this ring is slipped the head of a pair of pincers, in the jaws of which is placed the end of the gilt bar, which had previously been hammered at one end, so as to enable it to pass through the hole pierced in a steel plate; through this hole the bar has to be drawn, and, being drawn, is reduced in diameter, and proportionally increased in length. The handles of the pincers

* See "Lectures on the Results of the Great Exhibition of 1851; delivered before the Society of Arts." 2 vols. 8vo. Bogue, London, 1852-3.

being considerably wider than the head, and the ring gripping both handles, it follows that the greater the strain on the handles, the closer the grip of the jaws. The hold is tightened by placing a small piece of mica between the rod and the jaws of the pincers. One man holds the rod steadily and straight to the die, while another man turns the cylinder by pulling with his hands, and pressing with his feet, the handspikes, in the same way as we occasionally see the steersman at the wheel of the rudder of a large ship. As the cylinder revolves, the rod of metal lengthens, and winds round the cylinder. To lessen the friction in passing through the holes, the rod is invariably rubbed over with wax.

Having passed through the holes in the steel plate, each hole being a degree finer than the other, the wire is coiled up and re-heated, or annealed, by which it is softened, or made more malleable. Were this precaution omitted, the wire would become brittle, and break like cast metal. This process of drawing and heating is repeated over and over again, until the wire is reduced to the substance of ordinary whipcord, and it then passes into other hands. The importance of the division of labour is here recognised. The hands best adapted for the heaviest processes are altogether unfit for the more delicate branches of the business.

The workmen into whose hands the wire is now placed sit at a small bench, on which are two reels, or large bobbins, a short distance apart, on one of which the wire is wound; midway between them is fixed edgewise a frame, with a steel plate pierced with fifteen or twenty holes of different degrees of fineness. To make the wire pass easily through the finer hole, it is rubbed at the end between two pieces of porcelain, then slipped through the hole—caught with a pair of nippers, and attached to a limb or spoke of the empty reel, which is turned by the hand, and the wire is drawn through with perfect ease. This operation is continued and repeated until the wire becomes as fine as the finest hair.

In this state it cannot be used, for it is too weak to be woven, and must be united with some other fibre before it can be worked in the loom; and being round, it will not readily attach itself to the thread. It therefore becomes necessary that it should be flattened. This is done by beating it with a highly-polished steel hammer, on an anvil equally well polished, as the least flaw would damage the wire.

Eight or ten threads are wound on as many several small reels, like cotton spools. These are placed in two rows, on pegs fastened to a board, so as to turn horizontally. The several ends are passed through a row of small holes pierced in a piece of thick fish-skin attached to the anvil with wax—the holes being level with the surface of the anvil, and the gold wires pass on to the anvil separately, yet near each other. The operator seizes all the threads with the left hand, and draws them gently across the anvil, while with the right hand he hammers them as they pass. With one stroke he flattens the eight or ten wires with such remarkable skill that scarcely any difference can be detected in the width of the flattened wire, so accurately is each blow given.

The flattened wire now passes into the hands of a spinner or plater of gold thread. The process is very interesting. The orange-coloured silk is wound round two spindles, such as are used for spinning cotton or wool—the ends of the two threads are passed through a ring fastened to the ceiling of the room, and both bobbins are brought to an equal height from the ground; by being rubbed sharply along the thigh they are set in motion in opposite directions, and spin round with great velocity. As they spin, the gilt wire, flattened as described, and guided by the left hand, is wound round the threads with an evenness and regularity almost incredible, considering the rudeness of the implements used; and our surprise is greatly increased on examining the articles afterwards manufactured.

In this very concise description of a most interesting branch of industry there are several facts of detail omitted which it would have been well to have had supplied—such as the time occupied in bringing the rod of six inches long into the wire as fine as hair—the length of the hair so drawn—the value of the labour so condensed, and sundry other points, without which we cannot satisfactorily arrive at any economical result. These omissions, how-

ever, are amply supplied by the processes adopted in London. The same, or very similar methods, prevail in the several cities of Europe where the manufacture of gold lace is encouraged, but he confined himself to what he had seen, and in this branch of his paper he was much indebted to the courtesy of Messrs. Johnson, Simpson, and Simons, whose works had been thrown open to him, and to Mr. Simons he was indebted for many of the details.

Silver being the basis of what is technically called gold thread, it is well to consider what silver is best for the purpose. The silver in greatest favour with wire-drawers is extracted from lead. This may probably retain a certain portion of the nature of the ore with which it was previously in combination, and may be tougher than that obtained from other mines. The manner in which the silver is separated from the lead is very simple, and most interesting. Without detailing the several processes practised by various miners, he referred to an improved plan in operation at the lead mines of the Duke of Buccleuch, at Wanlockhead, in the high district of Dumfriesshire. The process is founded on the property which bodies possess of separating from each other during crystallisation. The argentiferous lead is melted in a large vessel, and the temperature is arranged to such a point, that the lead becomes crystallised. The crystals of pure lead are then removed as soon as formed, by means of a large iron ladle, pierced with holes, and the silver is thus left combined with a smaller portion of lead, which thus gradually becomes more and more rich, until, by successive operations, it is brought to such a state, that further separation can be advantageously effected by the ordinary means of cupellation.

The facility with which silver can be thus separated from the lead gives the owner the advantage of making the lead of the required richness. He need hardly tell his audience that the quality of lead depends greatly on the quantity of silver combined with it. The silver so produced comes to the market usually in the form of a cake, and is afterwards melted and grained. A certain quantity is weighed—say from 400 to 500 ounces,—and placed in a crucible, or, in the common language of the trade, a *pot*, which is placed in a charcoal fire, and there remains until the metal is of nearly a white heat. The best crucibles for such purposes are of American manufacture, composed of black-lead and a mixture of a peculiar clay. When heated as described, it is ready to be poured into the ingot moulds. These moulds are made of iron, and sometimes of copper; but it has been proved by experience that the iron mould is the best, because the copper moulds, after being used a given number of times, are liable to fracture. Before pouring the metal into the mould, it is important that the mould itself should be heated to a certain point. Unless this is attended to, steam or gas is generated, and causes a spurting of the metal, producing air-bubbles, or flaws, in the ingot, and any imperfection of that nature produces an ultimate defect in the wire. The ingot mould is in two pieces, kept together by very strong clamps and screws. When the metal is sufficiently set, the screws are loosened, the mould separates, and the ingot of silver falls easily out. The ingot so cast is about two inches in diameter, and from twenty to twenty-four inches in length. The bar, or ingot, is then placed in a charcoal fire until red-hot, whence it is taken and held and turned on the anvil by one man, while three others, with heavy hammers, hammer it well. This beating and hammering continues until the bar is reduced to a size suitable for the first hole, or die, through which it has to be drawn, and by the hammering is increased in length from four to five inches, or about twenty per cent. The hammering, so fiercely applied, changes the nature of the metal precisely in the same way as iron is changed by rolling and hammering, laying all the fibres one way, and proportionably increasing its tenacity and elasticity. The bar so prepared is pointed, and made to fit the first die through which it has to pass, and laid on the draw-heuch with the point slipped through the die. The point is then seized by the jaws of a pair of monster pincers, or draw-tongues, with short bow arms, at the end of each of which is a hook that slips over a ring, attached to the end of a strong chain cable, drawn by a steam-engine exerting the power of sixteen horses. The greater the draught the tighter the grip, and the ingot passes through the first die with

the greatest ease, and is reduced in diameter, but increased in length from ten to fifteen per cent. This process is repeated ten or twelve times, each time the rod being drawn through a smaller die. The bar is then removed to another bench, where it is placed so as to remove all roughness or other imperfections on the surface, as the slightest blemish would interfere with perfect gilding—such blemishes being best detected by placing over the bar a sheet of foolscap paper, slightly arched, which by its reflection shows every speck instantly and most distinctly. The bar of metal, being so prepared, is considerably reduced in weight as well as in size, and is now ready for gilding. As the richness of the wire depends upon the thickness of the gold laid on, and as all the gold leaves are very nearly, if not absolutely, of the same substance, the quality of the wire is regulated by the number of leaves placed one over the other, and these vary from ten to thirty leaves. The higher qualities are used for military purposes, and pearls and bullions for embroidery. The lower qualities being in demand chiefly for liveries, for the ends of muslins, and also for skein thread exported to India and China. The gold leaves, whether of the depth of ten or thirty, are laid in a row side by side, nearly the length of the bar, on a piece of ordinary cartridge paper; the bar is gently laid on the leaves, pressed close, and the edges of the leaves raised up until the silver is entirely covered with gold leaf; there is no size or foreign matter whatever used; because any such matter would, in the fire, prevent perfect cohesion. Nor is there any water used, as in the Indian process—the natural adhesion of the highly-polished silver to the gold appears to be sufficient. The bar so overspread with leaf and enveloped in paper is tied tightly round with cord, and placed in the centre of a heap of lighted charcoal, where it remains until it assumes a bright red heat. One would imagine that the paper must instantly take fire and disappear, but such is not the case. The atmosphere being carefully excluded, it gradually becomes red with the metal, and when the paper has been entirely consumed, the bar is nearly ready to be withdrawn. While red-hot, it is placed on a frame, or bench, and vigorously burnished with a blood-stone—a substitute for which, and nearly as good, has been found in a stone discovered in the South Seas, probably the same as that from which the natives of those islands make their spear-heads, hatchets, and weapons of war. This burnishing serves a double purpose—it forces out any air that may have remained between the gold and the silver, and at the same time brings them closer together. When quite smooth, it is permitted to cool gradually.

When quite cool, the surface is covered with wax, and then commences the more rapid reduction of size by drawing the bar through graduated steel dies, highly-polished, as the slightest roughness would damage the metal, and although it might now pass undiscovered, by-and-by it would show itself in defective wire. These slight physical defects, like moral flaws, cannot be always hid, but, sooner or later, will appear on the surface. When reduced to the size, technically called *disgrossed*, it is annealed, care being taken to exclude the air from the surface, otherwise the gold, being now so thin on the silver, would partially melt, and present a blackened appearance. After remaining in the fire about an hour, it is placed under other superintendence, and removed to other machinery, moving with greater speed, and rapidly passes through a number of finer holes, each decreasing in size, until it is reduced to the size he held in his hand. After this it is heated and drawn through a hole, which removes all wax and dirt from the surface.

The steel dies are then dispensed with, because, from experience, it had been found that the holes were liable to become what wire-drawers call square; and, until within a comparatively recent period, the ounce of metal could not be drawn into more than 900 or 1000 yards.

One of the firm to which he was so much indebted was the first to suggest an experiment with a jewelled die. Many difficulties were at first experienced, but all were overcome, and a perforated ruby, set in a metallic frame, answered admirably, and enabled the drawer to produce, from one ounce of metal, a wire a mile and a quarter long, and finer than a lady's hair. In connection with this discovery, it is somewhat singular that there are not more than three

men in London capable of perforating and setting these ruby dies properly; one man, who works probably not more than three hours a day on the average, has received from one wire-drawing firm as much as £500 or £600 in a single year, while they only pay from 4s. to 5s. for each die.

Presuming that the finest point is reached, it is found that the colour is not so rich and deep a shade of yellow as fashion desires. To effect this a very simple and ingenious plan is adopted. The wire is wound round a copper cylinder, a small portion of wax being added; the bore or cavity of the cylinder is filled with red-hot charcoal, made from birch wood, that being found the best; so the wire in its finest state is again annealed; and what appears singular, the colour is deepened and rendered permanent.

It is now ready to be flattened preparatory to spinning round the silk, and this is accomplished by winding it from the copper cylinder on to smaller bobbins, ready for the flattening-machine, which is very simple and very small. There are only two rollers for it to pass between, the one being about ten and the other four inches in diameter, and two inches wide, slightly convex on the face.

To impress a substance as fine as a hair, and flatten it to twice or treble its original width, requires the nicest possible adaptation of parts. They would not be surprised to hear that a single pair of rolls costs £120. The metal is of the rarest quality of steel, and the polish higher than the finest glass. At one time these rollers were made in Sheffield, but now they are manufactured in Rhenish Prussia.

The wire so flattened is now wound on small bobbins, which are placed in the centre of circular rings, attached to a bar over a spinning-frame. On the front of the frame are bobbins of silk, the threads of which pass through the centre of the ring to which the reel with wire is fixed. The whole is set in motion, and while the thread is being twisted, the ring with the wire revolves round the thread in the opposite direction, and thirty or forty threads are plated at once—one girl attending to them all; and so the gold thread is finished, and ready for any purpose the consumer may require.

In its new form, though only gold is seen, probably nine-tenths of its bulk is silk, while of the remaining one-tenth only one-fiftieth part is gold; so by labour and ingenuity they were put in possession of a gold thread, of which only one part in five hundred is in reality gold.

It was important to ascertain the quantity of labour required to reduce the ingot of silver, weighing 420 ounces, to the finished wire, weighing 360 ounces, 60 ounces having been cut off—not destroyed—in the several processes of pointing, plaining, and occasional accidental waste:—

	Hours.
To reduce the ingot to the size when it is cut into 10 equal parts, of about 36 ounces each, takes 3 men 20 hours each	60
To reduce from hank to firing off size takes, for each hank, 1 man 5 hours, or for 10 hanks ..	50
To reduce from firing off to 300 yards per ounce size takes, for each hank, 9 hours, or for 10 hanks	90
To reduce 300 yards to 1200 yards per ounce size takes, for each hank, 18 hours, or for 10 hanks	180
To reduce from 1200 yards to 1800 yards size takes, for each hank, 25 hours, or for 10 hanks ..	250
If reduced to 2000 yards, each hank would take at least 7 hours, or for 10 hanks	70
	700

Allowing ten hours to the day, it would take one man seventy days or ten weeks to reduce by his labour the ingot of silver, weighing 420 ounces to its finest size. But no one man is equal to the entire duty. The early processes demand the exercise of Titanic powers, while the later processes demand the lightest touch of almost fairy fingers.

In constructing the foregoing table, he had some difficulty, from the fact that, so far as he could discover, the question had never before been looked at from the labour-consumption point of view. There may be some errors, arising from imperfect information, but he believed it would be found sufficiently accurate to enable them to estimate the labour necessary to make four hundred ounces of gold, in a bar twenty inches long, stretch over five hundred miles. Fifty such bars would bind the earth with a golden hoop. But as the four hundred ounces of silver is guilt with only eight ounces of

gold leaf, each leaf weighing eighteen grains, and four inches square, it follows that only one-fiftieth part of the wire is gold. So eight ounces of gold in combination with silver is made to stretch five hundred miles, or over sixty miles for a single ounce. Nothing can more clearly show the wonderful ductility of this most wonderful metal. One would imagine that in passing through so many holes, the gold would be liable to be scraped from the surface of the silver; but it is not so. In passing through the die every atom of the metal is excited and stretched simultaneously, each atom retaining its relative position. As, from first to last, the wire passes through one hundred to one hundred and twenty dies, it follows that the ingot in its course traverses over fifty thousand miles, or twice the circumference of the globe.

Before passing to the last division of his paper, a few observations might be permitted, marking the differences that exist between manual and mechanical labour, as suggested by the Indian and English processes of wire-drawing.

In London five hundred ounces of metal could be drawn into wire while ten are drawn at Pailthun.

In London it can be drawn 2000 or even 2200 yards to the ounce, while in Pailthun they stop short of 1000 or 1200 yards.

In London the manufacturer depends upon mechanical ingenuity, which enables comparative children to execute a very large proportion of the work; while in India, age and great experience are essential to the production of a marketable commodity.

The difference will increase year by year. Electro-gilding in some way or other must, sooner or later, supersede the present process. Whether its application shall be to the bar of silver in bulk, or to the completed wire, he could not determine; but looking at the conditions of the trade, considering the scientific principles involved, and the chemical processes that may be applied, he had no more doubt of the result desired being accomplished than he had in his own existence.

Certain it is that, ere long, English industry will supply India, and probably China, with all the prepared thread they require for the production of their sumptuous robes: the only surprise is that English enterprise and English looms had not long ago supplied those distant countries with the manufactured article.

When they considered the consumption of the precious metals—the no less precious money, and the still more precious labour consumed in the manufacture of gold thread—it was not only not satisfactory, but very humiliating, to confess that a very large proportion of the quantity produced was flung away and wasted—much being consumed in bars of gold shot in at the ends of webs of muslin or other cloth, to produce an attractive finish, which, when purchased for consumption, was torn off, and cast into the fire.

Having entered so fully into the details of wire-drawing, flattening, and spinning, he now came to the new and patented plan of

FIBRE GILDING.

For many years chemists had attempted every known method of gilding, in the hope of discovering some process by which silk, or other fibre, could be gilded without applying the immense labour, seen to be necessary, before a thread with a covering of gold can be used with facility in the loom, and woven into cloth, but they always failed. In France, where scientific research is liberally promoted by the government, a large reward was offered for a successful plan, but no man ever had the opportunity or satisfaction of claiming it. The electro process gave a fresh impulse to scientific men.

The difficulties of the first stage were soon overcome, and gold was compelled to attach itself to the surface of the thread. Here a new difficulty arose—the thread, being completely soaked, was long in drying, and when dried had lost its lustre; while the foundation on which the gold rested was so soft and flimsy, that to burin it was impossible. They only produced a gold thread which had not the effect of gold, and was therefore useless. Among the several investigators was Mr. Albert Hock, who, failing to find in chemistry the principle by which fibres could be gilded, succeeded by means of a simple mechanical contrivance.

In the first place, it is essential that the silk used

should be of a superior quality, free from knotty ribs and rough places. The gum must be boiled out of the silk, and the silk tinged to the shade of a light orange. The bobbins containing the silk are placed on a wire, on which they revolve when gently pulled. The end of the thread is passed over a wire, and then under a roller, which works in a trough containing a glutinous but transparent liquid. It then passes over a reel attached to an endless screw, or threaded spindle, so arranged that it lays on a brass cylinder the thread of silk as close as cords are wound round the handle of a whip, without overlapping, until the cylinder is completely covered with the silk, when the thread is broken; the length of the skein of thread depends, therefore, upon the size of the cylinder and the fineness of the thread, but the cylinder cannot be increased beyond a certain size, and that size must not be larger than can be spanned by a single leaf of gold, and the goldbeaters will not produce it larger than three and five-eighths of an inch square. When the leaf was to be four inches square, the London goldbeater declined the order, advancing as a reason, that, were he to demand such a size, every journeyman he had would strike and leave him. The gold leaf was procured from France—another instance of the mischief done to commerce by trade combinations.

The cylinder being covered with silk in a gummy state, the hook with the gold leaf is opened, and laid on the palm of the hand; the machine—something like a turning-lathe—is moved; the edge of the leaf is made to touch the gummed silk, and it is quickly drawn round, covering the silk. This is repeated until the entire surface of the silk on the roller is covered with gold leaf. A piece of cloth or washed leather is fastened on a slip of wood, something like a razor-strop. The roller is turned round, and the strop pressed firmly upon the leaf, which not only presses the leaf closer to the silk, but separates the leaf between each of the windings of the finest thread; and so one side of the finest thread is gilded. It is thus apparent that if gold and green, or any other colour, is desired in combination with gold, it is only necessary, first, to dye the thread the colour required, and then, by gilding one side, the combination wished is secured. To gild the entire thread, the half-gilded thread is wound on to another roller. The gilded side of the silk thread necessarily winds next to the brass on the second roller, leaving the ungilt part of the thread exposed, and ready to be treated in the same manner as before described, and so the process is completed. It is then wound on to reels of the usual size, and permitted to dry thoroughly. After this it is reeled on boards, or, as the French call them, *planchettes*, and is ready for the market. The colour is very beautiful, being the natural colour of the gold leaf. The great advantage of this over every other thread is its lightness and perfect flexibility, for it can be wound and woven wherever any other thread can be wound or woven. Its only disadvantage consists in the impossibility of producing by this process that tinted and glaring effect which ladies seem to consider a prime essential wherever gold is used. In reality it is a new but very expensive colour. The sizes of the threads are regulated by the number of ends of silk wound round the roller at once. The substance used for attaching the gold leaf to the threads unites them, and brings them into one thread.

As regards cost, it is, size for size, considerably dearer than the ordinary gold thread; but as it measures a much greater length for the weight, it virtually becomes, for weaving purposes, very much cheaper. The finest ordinary gold thread measures about 550 yards to the ounce, and costs about eight shillings. A similar size of silk, gilded by the new process, weighing one-third the weight, and measuring the same, would not cost over five shillings. Where fine gold leaf is used it is untarnishable; but copper can be used with the same facility as gold, and costs little more than half the price, while for ordinary purposes it answers quite as well.

In France there is a considerable demand for, and a steadily increasing consumption of, the material. Whether the manufacturers of England will enter the lists, and endeavour to compete with their enterprising neighbours, it is difficult to determine. The patentees seem to have received less encouragement than they had a right to expect from the manufacturers of the United Kingdom.

THE FAUSSETT COLLECTION.*

THE Faussett Collection has recently obtained so much celebrity, as well for its intrinsic excellence as for the strange perversity by which it has been cast aside from our National Museum, that this elegant volume must be peculiarly acceptable to all students of our Saxon Antiquities. A more important addition to our knowledge of the manners and customs of our Saxon forefathers has never appeared. It comprises the detailed results of the opening of nearly eight hundred tumuli, ranging over that part of Kent, from Canterbury to the sea, inhabited by the early Saxon settlers in England—their graves containing in all instances the weapons of the men, and the personal decorations of the women, who thus took with them to “the narrow house” those things they most valued in life. It is impossible to over-estimate the value of so extensive and curious a collection, unique in its power of illustrating a dark period in English history. In looking over the splendid examples of jewellery engraved in this book, or the varied appliances for the ordinary luxuries or wants of life, we cannot fail to be struck by the high amount of taste and civilisation they prove must have existed among the pagan Saxons, who are too frequently considered semi-barbarous. The jewellery particularly excites surprise; and the marvellous brooch discovered at Kingston, and forming the opening plate of this volume, has been pronounced by jewellers of the present day as fully equal in manipulative power to any modern work of their art. It is three inches and a half in diameter; and its surface is covered by five concentric circles of gold, inclosing garnet, turquoise, and mother-of-pearl, cut to fill variously shaped cells, the effect of the jewels being heightened by layers of gold foil. Between many of the stones is gold chain-work, twisted and interlaced, the whole being secured and affixed on a gold base, and the pin which secured it to the mantle also milled and encased with equal splendour. It is the grandest piece of jewellery of its age ever discovered in this or any other country. But even this fine work is rivalled in delicacy of manipulation by some others of a smaller kind in the same collection; and the details of that on Plate II., fig. 4, and the elegant pendants, Plate IV., figs. 4, 7, and 13, assert the high ability of these early goldsmiths.

When we say that the collection contains twenty of these magnificent brooches; more than fifty jewelled pendant ornaments in gold, silver, and base metals; buckles and personal ornaments of the most varied kinds, comprising all that the luxury of the Saxon might require; an abundance of defensive arms for the warrior; an equal abundance of toilette implements, or *articles de toilette*, for “the fair-haired maidens” he defended; glass, pottery, and miscellanea, making up an almost complete picture of the everyday life of this ancient people, an idea may be formed of the extreme value and paramount interest of this unique collection.

Certainly one of the most curious instances of the accidents which beset literature and science is afforded by the history of this collection, which has been allowed to remain in obscurity for nearly a century, and the manuscript account liable to every accident or total destruction. After it had been brought again to the notice of the antiquarian world by Mr. Roach Smith, in 1844, not one of the Antiquarian Societies moved one step towards the publication of any portion, although freely tendered to their use. But more marvellous than all, when the entire collection, including the whole of the manuscripts and drawings, was very properly offered in the first instance to the trustees of the British Museum, that it might find its proper resting-place in our National Collection, then almost entirely wanting in National Antiquities, it was entirely refused by that body! Astounded at such a result, as the price required was extremely moderate, the leading students in antiquities took alarm; the officers of the museum argued with their *superior* (?) officers, the trustees, and were backed by urgent petitions from the Society of Antiquaries, the Archaeological Institute and Association, by many private individuals, and by the still more important promises of the free gift of

other private collections of Saxon Antiquities to swell the national store, should the purchase be effected. The time for the decision of the trustees was extended by Dr. Faussett's executors, and the whole subject in its full bearings again placed before their eyes, accompanied by the fact that three private collectors were only awaiting their decision to purchase the whole at an advanced price, so that even the inbred trading spirit of an English board might be more than satisfied with the whole transaction. We can scarcely ask our readers to credit the fact, but the offer was again refused! and the collection next day passed into the hands of Mr. Joseph Mayer, F.S.A., of Liverpool, who at once made arrangement for the publication of the original records of Faussett's discoveries, securing the services of Mr. Roach Smith to edit the manuscripts, and Mr. Fairholt to draw and engrave every object comprised in the collection.

Although the originals be thus lost to the nation, the printing-press will make them even more useful to the general world; and, thanks to Mr. Mayer's spirited proceedings, the discoveries may belong by this means to every student of our early history. It is quite certain that had the British Museum purchased the collection, its rulers would not have published the manuscript, and caused the antiquities to be engraved for general use, as they have now been done. Thus, out of a great evil a much greater good has arisen to aid science in general; and Mr. Mayer, Mr. Roach Smith, and Mr. Fairholt, have thus given to the world at large the full benefit of Faussett's research; and in doing it have also produced an undying record of disgrace to the trustees of the British Museum, which must last while literature exists.

Of the labour of Mr. Roach Smith as editor we can conscientiously speak in high terms. He has faithfully given the original record by Bryan Faussett, accompanied by notes explanatory and critical, comprising the results of that knowledge which recent experience has given the archaeologist. But he has done much more than this; for in an elaborate introduction to the volume he has written such a clear record of the results of the various isolated researches of investigators, combined with his own experiences, as to realise the truth of his opening words:—“The real value of antiquities should be determined by the extent to which they are capable of being applied toward illustrating history.” Seldom have we met a more honest exponent of facts than Mr. Roach Smith, or one who has less desire to argue for favourite theories; he has been imbued with the proper spirit of a truthful inquirer, who values his labour but as the means of eliciting *fact* in all clearness. For the first time he has enabled us to classify the somewhat chaotic mass of Saxon antiquities discovered at home and abroad; and by the careful comparison of their peculiarities, and the thoughtful testing of historic record, made one illustrate the other so completely, that we may safely refer certain ornaments to certain tribes, who had settled in various parts of England, and who brought with them and retained many peculiarities from their original homes. It is this enlarged and philosophic system of comparison which can alone clarify the obscure points of early British history where written documents fail; and we therefore regard this volume as a most important introduction to the history of Saxon England. When we turn to the pages of the ordinary histories, and see how brief and unsatisfactory they are, we feel that there is ample space for a new history before the Norman conquest, for which such works as this pioneer the way.

Mr. Fairholt's labours have been conducted in a similar spirit to the editor's, and he has most scrupulously laboured for truth alone. There is no attempt in his work at meretricious effect; but wherever the grace of Art was requisite it has been called into play; and the jewels are all coloured by hand—so faithfully that we seem to look on the originals; while the plates of beads are equal to water-colour drawings in delicacy of shadow and variety of tint. They are the most perfect things of their kind that have yet appeared. Various processes have been adopted for the proper delineation of the various objects; and while the sharpness of the engraved line defines the minute patterns on the jewels, the softness of aquatint realises the texture of the glass or pottery.

THE ROYAL PICTURES.

A FÊTE CHAMPÊTRE.

J. B. Pater, Painter. Pelée, Engraver.
Size of the Picture, 1 ft. 11½ in. by 1 ft. 7½ in.

THIS picture, a companion work to the “Fête Player,” introduced in the *Art-Journal* of December, 1855, shows in a more remarkable manner than the other the influence which Watteau had on the French school in the time of Louis XVI. It is an elegant example of the style of Art which comes strictly under the denomination of scene-painting. The figures are well *mise en scene*, to use a theatrical expression; the characters are effectively grouped, and each plays a carefully-studied part; they are picturesquely costumed, and altogether compose into a very pretty *tableau*, significant of the dames and cavaliers of France in the beginning of the last century. The proper term to apply to the Art of that period is “decorative:” it pleases, but the enjoyment is only transitory; it invites no study, and consequently offers nothing for thought to feed upon; it is brilliant, but its light is of that transient character, with regard to its effect upon the mind, which leaves little else than vague and unsatisfactory results. Hazlitt has written rather a severe censure, yet one not very far from the truth, on the French school generally; his remarks, however, apply, in our opinion, rather to what it was than to what it now is—for the influence of the modern German school may be distinctly recognised in the works of the best artists of France. “The French painters see nature with organs and with minds peculiarly their own. One must be born in France to understand their poetry or their painting. Their productions in Art are either literal or extravagant—dry, frigid facsimiles, in which they seem to take up nature by pin-points, or else rapid, distorted caricatures, out of all rule and compass. They are, in fact, at home only in the light and elegant; and whenever they attempt to add force or solidity (as they must do in the severer productions of the pencil) they are compelled to substitute an excess of minute industry for a comprehension of the whole, or make a desperate mechanical effort at extreme expression, instead of giving the true, natural, and powerful workings of passion.”

But these strictures lose much of the *rationale* of the argument, if we consider, as in justice we ought to do, that the Art of every country has a national character: it is the reflex of the people in their habits, thoughts, and customs, and must therefore be criticised with such considerations. One has no right to condemn a style of Art because it does not harmonise with our ideas, nor pronounce it worthless because we are mentally or constitutionally unable to appreciate its excellence; and there is excellence even in the works of Watteau, Pater, Lancret, Boucher, and others of the same class. The sacred and legendary Art of Papal Italy, the *genre* pictures and the carousing boozers of Holland and Flanders, nay, even the works of our own school, which possess a distinct nationality, would, upon such evidence, be subject to stricture in countries where they could not be understood; just as the Red Indian, for example, is unable to see any personal beauty except in a face well tattooed, and daubed over with all kinds of colour. Each individual artist, or school of artists, speaks its own thoughts in its own language; and it would be just as reasonable to condemn them for not seeing and feeling as others do, as it would be to be angry with a foreigner who does not address us in our own mother tongue.

The principal defects in the pictures of the French artists, both past and present, with a few exceptions, is an absence of truthfulness and nature; while it is the presence of this most valuable quality in the works of our painters which so surprised, and elicited the applause of, the French critics in the late Exhibition in Paris. Now it is just possible that a number of ladies and gentlemen may have so disposed themselves as they are represented in the “Fête Champêtre;” but the probability is they would not; the artist has therefore erred against truth and nature in this lively but affected composition.

The picture is in the collection at Buckingham Palace: it is painted with much delicacy, and is very harmonious in the tone of its colouring.

THE MONKS OF THE MIDDLE AGES.*

BY THE REV. EDWARD L. CUTTS, D.A.

HAVING thus given a sketch of the history of the various monastic orders in England, we proceed to give some account of the constitution of a convent, taking that of a Benedictine monastery as a type, from which the other orders departed only in minor particulars.

The *convent* is the name especially appropriate to the body of individuals who composed a religious community. These were the body of cloister monks, lay and clerical; the professed brethren, who were also lay and clerical; the clerks; the novices; and the servants and artificers. The servants and artificers were of course taken from the lower ranks of society; all the rest were originally of the most various degrees of rank and social position. We constantly meet with instances of noble men and women, knights and ladies, minstrels and merchants, quitting their secular occupations at various periods of their life, and taking the religious habit; some of them continuing simply professed brethren, others rising to high offices in their order. Scions of noble houses were not unfrequently entered at an early age as novices, either devoted to the religious life by the piety of their parents, or, with more worldly motives, thus provided with a calling and a maintenance; and sometimes considerable interest was used to procure the admittance of novices into the great monasteries. Again, the children of the poor were received into the monastic schools, and such as showed peculiar aptitude were sometimes at length admitted as monks,† and were eligible, and were often chosen, to the highest ecclesiastical dignities.

The whole convent was under the almost absolute rule of the *abbot*. Sometimes he was elected by the convent; sometimes the king or some patron had a share in the election. Frequently there were estates attached to the office, distinct from those of the convent; sometimes the abbot had only an allowance out of the convent estates; but always he had great power over the property of the convent, and bad abbots are frequently accused of wasting the property of the house, and enriching their relatives and friends out of it. The abbots of some of the more important houses were mitred abbots, and were summoned to Parliament. In the time of Henry VIII. twenty-four abbots and the prior of Coventry had seats in the House of Peers.

The abbot did not live in common with his monks; he had a separate establishment of his own within the precincts of the house, sometimes over the entrance gate, called the Abbot's Lodgings.‡ He ate in his own hall, slept in his own chamber, had a chapel, or oratory, for his private devotions, and accommodation for a retinue of chaplains and servants. His great duty was to set to his monks an example of observance of the rule, to keep them to its observance, to punish breaches of it, to attend the services in church when not hindered by his other duties, to preach on holy days to the people, to attend chapter and preach on the rule, to act as confessor to the monks. But an abbot was also involved in many secular duties; there were manors of his own, and of the convent's, far and near, which required visiting; and these manors involved the abbot in all the numerous duties which the feudal system devolved upon a lord towards his tenants, and towards his feudal superior. The greater abbots were barons, and sometimes were thus involved in such duties as those of justices in eyre, military leaders of their vassals, peers of Parliament. Hospitality was one of the great monastic virtues. The usual regulation in convents was that the abbot should entertain all guests of gentle degree, while the convent entertained all others. This again found abundance of occupation for my lord abbot in performing all the offices of a courteous host, which seems to have been done in a way becoming his character as a lord of wealth and dignity; his table was bountifully spread, even if he chose to confine

himself to pulse and water; a band of wandering minstrels was always welcome to the abbot's hall to entertain his gentle and fair guests; and his falconer could furnish a cast of hawks, and his forester a leash of hounds, and the lord abbot would not decline to ride by the river or into his manor parks to witness and to share in the sport. A pretty little illustration of this abbatial hospitality occurs in Marie's "Lay of Ywonne."* A baron and his family are travelling in obedience to the royal summons, to keep one of the high festivals at Caerleon. In the course of their journey they stop for a night at a spacious abbey, where they are received with the greatest hospitality. "The good abbot, for the sake of detaining his guests during another day, exhibited to them the whole of the apartments, the dormitory, the refectory, and the chapter-house, in which last they beheld a splendid tomb covered with a superb pall fringed with gold, surrounded by twenty waxen tapers in golden candlesticks, while a vast silver censer constantly burning filled the air with fumes of incense."

An abbot's ordinary habit was the same as that of his monks. In the processions which were made on

A BENEDICTINE ABBOT.

certain great feasts, he held his crosier, and if he were a mitred abbot, he wore his mitre: this was also his parliamentary costume. We here give a beautiful drawing of a Benedictine abbot of St. Alban's, thus habited, from the Catalogus Benefactorum of that abbey. When the abbot celebrated high mass on certain great festivals, he wore the full episcopal costume. Thomas Delamere, abbot of St. Alban's, is so represented in his magnificent sepulchral brass in that abbey, executed in his lifetime, circa 1375 A.D. Richard Bewferest, abbot of the Augustine canons of Dorchester, Oxfordshire, has a brass in

BENEDICTINE ABBESS AND NUN.

that church, date circa 1520 A.D., representing him in episcopal costume, bareheaded, with his staff; and in the same church is an incised gravestone, represent-

ing Abbot Roger, circa 1510 A.D., in full episcopal vestments. Abbesses wore the crosier in addition to the ordinary costume of their order. The sepulchral brass of Elizabeth Harvey, abbess of the Benedictine Abbey of Elstow, Bedfordshire, circa 1530 A.D., is thus represented in the church of that place. We here give a representation of a Benedictine abbess from the fourteenth century MS. Royal, 2 B. vii.

Under the abbot were a number of officials (*obedientiarii*), the chief of whom were the Prior, Precentor, Cellarer, Sacrist, Hospitaller, Infirmer, Almoner, Master of the Novices, Porter, Kitchener, Seneschal, &c. It was only in large monasteries that all these officers were to be found; in the smaller houses one monk would perform the duties of several offices. The officers seem to have been elected by the convent, subject to the approval of the abbot, by whom they might be deposed. Some brief notes of the duties of these obedientiaries will serve to give a considerable insight into the economy of a convent. And first for the *Prior*:—

In some orders there was only one abbey, and all the other houses were priories, as in the Cluniac, the Gilbertine, and in the Military and the Mendicant orders. In all the orders there were abbies, which had had distant estates granted to them, on which either the donor had built a house, and made it subject to the abbey; or the abbey had built a house for the management of the estates, and the celebration of divine and charitable offices upon them. These priories varied in size, from a mere cell containing a prior and two monks, to an establishment as large as an abbey; and the dignity and power of the prior varied from that of a mere steward of the distant estate of the parent house, to that of an autocratic head, only nominally dependent on the parent house, and himself in everything but name an abbot.

The majority of the female houses of the various orders (except those which were especially female orders, like the Brigittines, &c.) were kept subject to some monastery, so that the superiors of these houses usually bore only the title of prioress, though they had the power of an abbess in the internal discipline of the house. One cannot forbear to quote at least a portion of Chaucer's very beautiful description of his prioress, who was among the Canterbury pilgrims, "That of her smiling ful simple was and coy." She sang the divine service sweetly; she spoke French correctly, though with accent which savoured of the Benedictine convent at Stratford-le-Bow, where she had been educated, rather than of Paris; she behaved with lady-like delicacy at table; she was cheerful of mood, and amiable; with a pretty affectation of courtly breeding, and a care to exhibit a reverend stateliness becoming her office:—

"But for to spoken of her conscience,
She was so charitable and so pitous,
She would wepe if that she saw a mouse
Caught in a trappe, if it were dead or bled;
Of smale houndes had she that she fed
With rusted flesh, and milk, and wastel bread;
But sore wept she if one of them were dead,
Or if men smote it with a yerde smert,
And all was conscience and tendre herte.
Ful semly her wimple ypinched was;
Her nose tretis,* her eyen grey as glass,
Her mouth full small, and thereto soft and red,
And sicklerly she had a fayre forehed—
It was almost a spanne broad I trow,
And hardily she was not undergrow."†

Her habit was becoming, and she wore on her arm a set of beads of red coral gauded with green, to which was hung a jewel of gold, on which was—

"Written a crowned A,
And after, *Amor vincit omnia*.
Another nun also with her had she,
That was her chapelleine, and priestes three."

But in abbies the chief of the Obedientiaries was styled prior; and we cannot, perhaps, give a better idea of his functions than by borrowing a naval analogy, and calling him the abbot's first lieutenant—for, like that officer in a ship, the prior at all times carried on the internal discipline of the convent, and in the abbot's absence he was his vicegerent; wielding all the abbot's powers, except those of making or deposing obedientiaries, and consecrating novices. He had a suite of apartments of his own, called the prior's chamber, or the prior's lodging; he could leave the house for a day or two on the business of the house, and had horses and servants appropriated to his uses; whenever he entered the

* Ellis's "Early English Romance."

* Long and well proportioned.

† She was of tall stature.

monks present rose out of respect; some little licence in diet was allowed him in refectory, and he might also have refreshment in his own apartments; sometimes he entertained guests of a certain condition in his prior's chamber. In large convents he was assisted by a sub-prior.

The *Sub-prior* was the prior's deputy, sharing his duties in his residence, and fulfilling them in his absences. The especial functions appropriated to him seem to have been to say grace at dinner and supper, to see that all the doors were locked at five in the evening, and keep the keys until five next morning; and, by sleeping near the dormitory door, and by making private search, to prevent wandering about at night. In large monasteries there were additional sub-priors. Neither the prior, nor indeed any of the obedientiaries, wore any distinctive dress or badge of office.

The *Chantor*, or *Precentor*, appears to come next in order and dignity, since we are told that he was censured after the abbot and prior. He was choir-master; taught music to the monks and novices; and arranged and ruled everything which related to the conduct of divine service. His place in church was in the middle of the choir on the right side; he held an instrument in his hand, as modern leaders use a baton; and his side of the choir commenced the chant. He was besides librarian, and keeper of the archives, and keeper of the abbey seal.

He was assisted by a *Succentor*, who sat on the left side of the choir, and led that half of the choir in service. He assisted the cantor, and in his absence undertook his duties.

The *Cellarer* was in fact the steward of the house; his modern representative is the bursar of a college. He had the care of everything relating to the provision of the food and vessels of the convent. He was exempt from the observance of some of the services in church; he had the use of horses and servants for the fulfilment of his duties, and sometimes he appears to have had separate apartments. The cellarer, as we have said, wore no distinctive dress or badge; but in the *Catalogus Benefactorum*

ADAM CELLARIUS. NERO D. VII.

of the Benedictine Abbey of St. Alban's, there occurs a portrait of one "Adam Cellarius," who for his distinguished merit had been buried among the abbots in the chapter-house, and had his name and effigy recorded in the *Catalogus*; he is holding two keys in one hand and a purse in the other, the symbols of his office; and in his quaint features—so different from those of the dignified abbot whom we have given from the same book—the limner seems to have given us the type of a business-like and not un jovial cellarer.

The *Sacrist*, or *Sacristan* (whence our word sexton), had the care and charge of the fabric, and furniture, and ornaments of the church, and generally of all the material appliances of divine service. He, or some one in his stead, slept in a chamber built for him in the church, in order to protect it during the night. There is such a chamber in St. Alban's Abbey Church, engraved in the *Builder* for August, 1856. There was often a sub-sacrist to assist the sacrist in his duties.

The duty of the *Hospitaller* was, as his name implies, to perform the duties of hospitality on behalf of the convent. The monasteries received all travellers to food and lodging for a day and a night as of right, and for a longer period if the prior saw reason to grant it.* A special hall was provided for the entertainment of these guests, and chambers for their accommodation. The hospitaller performed the part of host on behalf of the convent, saw to the accommodation of the guests who belonged to the convent, introduced into the refectory strange priests or others who desired and had leave to dine there, and ushered guests of degree to the abbot to be entertained by him. He showed the church and house at suitable times to guests whose curiosity prompted the desire.

Every abbey had an infirmary, which was usually a detached building, with its own kitchen and chapel, besides suitable apartments for the sick, and for aged monks, who sometimes took up their permanent residence in the infirmary, and were excused irksome duties, and allowed indulgences in food and social intercourse. Not only the sick monks, but other sick folk were received into the infirmary; it is a very common incident in mediæval romances to find a wounded knight carried to a neighbouring monastery to be healed. The officer who had charge of everything relating to this department was styled the *Infirmer*. He slept in the infirmary, was excused from some of the hours, had two brethren to assist him besides the necessary servants, and often a clerk learned in pharmacy as physician.

The *Almoner* had charge of the distribution of the alms of the house. Sometimes money was left by benefactors to be distributed to the poor annually at their obits; the distribution of this was confided to the almoner. One of his men attended in the abbot's chamber when he had guests, to receive what alms they chose to give to the poor. Moneys belonging to the convent were also devoted to this purpose; besides food and drink, the surplus of the convent meals. He had assistants allowed him to go and visit the sick and infirm folk of the neighbourhood. And at Christmas he provided cloth and shoes for widows, orphans, poor clerks, and others whom he thought to need it most.

The *Master of the novices* was a grave and learned monk, who acted as pedagogue to the youths in the schools of the abbey, and taught the rule to those who were candidates for the monastic profession.

The *Porter* was an officer of some importance; he was chosen for his age and gravity; he had an apartment in the gate lodge, an assistant, and a lad to run on his messages. But sometimes the porter seems to have been a layman. And, in small houses and in nunneries, his office involved other duties, which we have seen in great abbeys distributed among a number of officials. Thus, in Maric's "*Lay le Fraime*," we read of the porter of an abbey of nuns:—

"The porter of the abbey arose,
And did his office in the close;
Rung the bells, and tapers light,
Laid forth books and all ready dight.
The church door he undid," &c.:

and in the sequel it appears that he had a daughter, and therefore in all probability was a layman.

The *Kitchener*, or *cook*, was usually a monk, and, as his name implies, he ruled in the kitchen, went to market, provided the meals of the house, &c.

The *Seneschall* in great abbeys was often a layman of rank, who did the secular business which the tenure of large estates, and consequently of secular offices, devolved upon abbots and convents; such as holding manorial courts, and the like.

But there was, Fosbroke tells us, another officer with the same name, but of inferior dignity, who did the convent business of the prior and cellarer which was to be done out of the house; and, when at home, carried a rod and acted as marshal of the guest-hall. He had horses and servants allowed for the duties of his office, and at the Benedictine Abbey of Winchcombe he had a robe of clerk's

* "And as touching the almshouse that they (the monks) delt, and the hospitality that they kept, every man knoweth that many thousands were well received of them, and might have been better, if they had not so many great men's horse to fede, and had not bin overcharged with such idle gentlemen as were never out of the abbeies (abbeys)." A complaint made to Parliament not long after the dissolution, quoted in Coke's Institutes.

cloth once a year, with lamb's fur for a supertunic, and for a hood of budge fur; he had the same commons in hall as the cellarer, and £2 every year at Michaelmas. Probably an officer of this kind was Alan Middleton, who is recorded in the

ALAN MIDDLETON.

Catalogus of St. Alban's as "collector of rents of the obedientiaries of that monastery, and especially of those of the bursar." *Prudenter in omnibus se agebat*, and so, deserving well of the house, they put a portrait of him among their benefactors, clothed in a blue robe, of "clerk's cloth" perhaps, furred at the wrists and throat with "lamb's fur" or "badge fur;" a small tinsure denotes him as a monastic officer, the penner and inkhorn at his girdle denote the nature of his office; and he is just opening the door of one of the abbey tenants to perform his unwelcome function. They were grateful men, these Benedictines of St. Alban's; they have immortalised another of their inferior officers, Walterus de Hamuntesham, *fidelis minister hujus ecclesie*, because on one occasion he received a beating at the hands of the rabble of St. Alban's—*inter villanos Sci Albani*—while standing up for the rights and liberties of the church.

WALTERUS DE HAMUNTESHAM ATTACKED BY A MOB.

Next in dignity after the obedientiaries come the *Cloister Monks*; of these some had received holy orders at the hands of the bishop, some not. Their number was limited. A cloister monk in a rich abbey seems to have been something like in dignity to the fellow of a modern college, and a good deal of interest was sometimes employed to obtain the admission of a youth as a novice, with a view to his ultimately arriving at this dignified degree. Next in order come the *Professed Brethren*. These seem to be monks who had not been elected to the dignity of cloister monks; some of them were admitted late in life. Those monks who had been brought up in the house were called *nutriti*, those who came later in life *conversi*; the lay brothers were also called *conversi* sometimes. There were again the *Novices*, who were not all necessarily young, for a conversus

passed through a noviciate; and even a monk of another order, or of another house of their own order, and even a monk from a cell of their own house, was reckoned among the novices. There were also the *Chaplains* of the abbot and other high officials; and frequently there were other clerics living in the monastery, who served the chantries in the abbey church, and in churches and chapels which belonged to the monastery and were in its neighbourhood. Again, there were the *Artificers and Servants* of the monastery: millers, bakers, tailors, shoemakers, smiths, and similar artificers, were often a part of a monastic establishment.* And there were numerous men-servants, grooms, and the like: these were all under certain vows, and were kept under discipline. In the great abbey of St. Edmund's Bury, in the time of Edward I., there were eighty monks; fifteen chaplains attendant on the abbot and chief officers; about one hundred and eleven servants in the various offices, chiefly residing within the walls of the monastery; forty priests, officiating in the several chapels, chantries, and monastic appendages in the town; and an indefinite number of professed brethren.

In the Cistercian abbey of Waverley there were in 1187 A.D., seventy monks and one hundred and twenty *conversi*, besides priests, clerks, servants, &c. But it was only a few of the larger houses which had such numerous establishments as these; the majority of the monasteries contained from five to twenty cloister monks. Some of the monasteries were famous as places of education, and we must add to their establishment a number of children of good family, and the learned clerks or ladies who acted as tutors; thus the abbey of St. Mary, Winchester, in 1536, contained twenty-six nuns, five priests, thirteen lay sisters, thirty-two officers and servants, and twenty-six children, daughters of lords and knights, who were brought up in the house.

We should hardly have a complete view of the population of a monastery if we neglected to notice that many of them had hospitals of poor men and women attached to them, generally either within the precincts or near adjoining. Thus at St. Edmund's Bury there was St. John's Hospital, or God's House, without the south gate, and St. Nicholas' Hospital without the east gate, and St. Peter's Hospital without the Risby Gate, and St. Saviour's Hospital without the north gate,—all founded by abbots of St. Edmund's. At Reading there was the Hospital of St. Mary Magdalene for twelve leprosy persons and chaplains, and the Hospital of St. Lawrence for twenty-six poor people, and for the entertainment of strangers and pilgrims, both founded by abbots of Reading. One at the gate of Fountains' Abbey for poor persons and travellers; one at Glastonbury, under the care of

hospital. From the initial letter of a deed in the British Museum (Harl., 1498), by which King Henry VII. founded a fraternity of thirteen poor men in Westminster Abbey, who were to be under the governance of the monks, we take the accompanying illustration, which represents the abbot and monks before the king, with a group of the king's bedesmen, each of whom has the royal badge, a rose surmounted by a crown, on the shoulder of his habit.

And lastly, there were a number of persons of all ranks and conditions, who were admitted to fraternity. Among the Hospitallers (and probably it was the same with the other orders), they took oath to love the house and brethren, to defend the house from ill-doers, to enter that house if they did enter any, and to make an annual present to the house: in return they were enrolled in the register of the house, they received the prayers of the brethren, and at death were buried in the cemetery. In the book of St. Alban's, which we have before quoted, there is a list of many persons, knights and merchants, ladies and children, vicars and rectors, received *ad fraternitatem hujus monasterii*; in many cases portraits of them are given: they are in the ordinary costume of their time and class, without any badge of their monastic fraternization.

We proceed next to give some account of the buildings which compose the fabric of a monastery. And first as to the site. The orders of the Benedictine family preferred sites as secluded and remote from towns and villages as possible. The Augustinian orders did not cultivate seclusion so strictly; their houses are not unfrequently near towns and villages, and sometimes a portion of their conventual church—the nave, generally—formed the parish church. The Friaries, Colleges of secular canons, and Hospitals, were generally in or near the towns. There is a popular idea that the monks chose out the most beautiful and fertile spots in the kingdom for their abodes; a little reflection would show that the choice of the site of a new monastery must be confined within the limits of the lauds which the founder was pleased to bestow upon the convent. Sometimes the founder gave a good manor, and gave money besides, to help them to build their house upon it; sometimes it was a tract of unreclaimed land, upon which the first handful of monks squatted like settlers in a new country. Even the settled land, in those days, was only half cultivated, and on good land, unreclaimed or only half reclaimed, the skill and energy of a company of first-rate farmers would soon produce great results; barren commons would be dotted over with sheep, and rushy valleys would become rich pasture covered with cattle, and great clearings in the forest would grow green with rye and barley. The revenues of the monastic estates would rapidly augment; but little of them would be required for the coarse dress and frugal rustic fare of the monks; they did not, like the lay land-owners, spend them on gilded armour and jewelled robes, and troops of armed retainers, and tournaments, and journeys to court; and so they had enough for plentiful charity and unrestricted hospitality, and the surplus they spent upon those magnificent buildings whose very ruins are among the architectural glories of the land. The Cistercians had an especial rule that their houses should be built on the lowest possible sites, in token of humility; but it was the general custom in the middle ages to choose low and sheltered sites for houses which were not especially intended as strongholds, and therefore it is that we find nearly all monasteries in sheltered spots. To the monks the neighbourhood of a stream was of especial importance, when headed up it supplied a pond for their fish, and water-power for their corn-mill. If, therefore, there were within the limits of their domain a quiet valley with a rivulet running through it, that was the site which the monks would select for their house. And here, beside the rivulet, in the midst of the green pasture land of the valley dotted with sheep and kine, shut in from the world by the hills, whose tops were fringed with the forest which stretched for miles around, the stately buildings of the monastery would rise year after year; the cloister court, and the great church, and the abbot's lodge, and the numerous offices, all surrounded by a stone wall with a stately gate-tower, like a goodly walled town, and a suburban hamlet of labourers and servants' cottages sheltering beneath its walls.

There was a certain plan for the arrangement of the principal buildings of a monastery, which, with minor variations, was followed by nearly all the monastic orders, except the Carthusians, and, perhaps, the small communities of Augustinian eremites. These latter differed from the other orders in this, that each monk had his separate cell, in which he lived, and ate, and slept apart from the rest, the whole community meeting only in church and chapter.* Our limits will not permit us to enter into exceptional arrangements.

The nucleus of a monastery was the cloister court; it was a quadrangular space of green sward, around which were arranged the cloister buildings, viz., the church, the chapter-house, the refectory, and the dormitory. The court was called the Paradise—the blessed garden in which its inmates passed their lives of holy peace. A porter was often placed at the cloister-gate, and the monks might not quit its seclusion, nor strangers enter to disturb its quiet, save under exceptional circumstances.

The cloister-court had generally, though it is doubtful whether it was always the case, a covered ambulatory round its four sides. The ambulatories of the twelfth and thirteenth centuries have usually an open arcade on the side facing the court, which supports the groined roof. In the fourteenth and fifteenth centuries, instead of an open arcade, we usually find a series of large traceried windows, tolerably close together; in many cases they were glazed, sometimes with painted glass, and formed doubtless a grand series of scriptural or historical paintings; the blank wall opposite was also sometimes painted. This covered ambulatory was not merely a promenade for the monks, it was the place in which the convent assembled regularly every day, at certain hours, for study and meditation; and in some instances (e.g. at Durham) a portion of it was fitted up with little wooden closets for studies for the elder monks, with book-cupboards on the wall opposite for books. The monks were sometimes buried in the cloister, either under the turf in the open square, or beneath the pavement of the ambulatory. There was sometimes a fountain at the corner of the cloister, near the entrance to the refectory, at which the monks washed before meals.

The church was always the principal building of a monastery, many of them remain entire, though despoiled of the shrines and tombs, and altars, and costly furniture, and many more remain in ruins, and they fill us with astonishment at their magnitude and splendour. Our existing cathedrals were, in fact, abbey churches; nine or ten of them were the churches of Benedictine monasteries, the remainder of secular Augustines. But these, the reader may imagine, had the wealth of bishops lavished upon them, and may not be therefore fair examples of ordinary abbey churches. But some of them were originally merely abbey churches, and were subsequently made Episcopal sees, such as Beverley, Gloucester, Christ Church Oxford, and Peterborough, which were originally Benedictine abbey churches; Bristol was the church of a house of regular canons; Ripon was the church of a college of secular canons. The Benedictine churches of Westminster and St. Alban's, and the collegiate church of Southwell, are equal in magnitude and splendour to any of the cathedrals; and the ruins of Fountains, and Tintern, and Netley, show that the Cistercians equalled any of the other orders in the splendour of their churches.

It is indeed hard to conceive that communities of a score or two of monks should have built such edifices as Westminster and Southwell, as private chapels attached to their monasteries. No, it is not so. This is one aspect of the fact, but it is not the true one: they did not build them for private chapels to say their daily prayers in; they built them for temples to the eternal and Almighty, to whose contemplation and worship they had devoted their lives. They did not think of the church as an appendage to their monastery, but of their monastery as an appendage to the church—the cloister under the shadow and protection of the temple was the court in which its priests and levites dwelt. †

* An account of the arrangements of a Carthusian monastery may be found in a paper on the Carthusian priory of Mount Grace, near Thirsk, which was read by Archdeacon Churton before the Yorkshire Architectural Society, in the year 1850.

† To be continued.

BEDESMEN. TEMP. HEN. VII.

the almoner, for poor and infirm persons. Thirteen was a very favourite number for the inmates of a

* The following notes will give an idea of the occupations of the servants. At Salley Abbey, at the end of the fourteenth century, there were about thirty-five servants, among whom are mentioned the shoemaker and barber, the prior's chamberlain, the abbot's cook, the convent-cook and baker's mate, the baker, brewers, tailor, cowherd, waggons, pages of the kitchen, poultry keeper, labourers, a keeper of animals and birds, bailiffs, foresters, shepherds, smiths: there are others mentioned by name, without a note of their office. In the time of William Rufus, the servants at Evesham numbered sixty-five—viz., five in the church, two in the infirmary, two in the cellar, five in the kitchen, seven in the bakehouse, four brewers, four menders, two in the bath, two shoemakers, two in the orchard, three gardeners, one at the cloister gate, two at the great gate, five at the vineyard, four who served the monks when they went out, four fishermen, four in the abbot's chamber, three in the hall.

THE ROYAL PICTURES.

ST. LUKE PAINTING THE VIRGIN.

E. Steidle, Painter. L. Stocks, A.R.A., Engraver.
Size of the Picture 5 ft. 10 $\frac{3}{4}$ in. by 4 ft. 4 $\frac{1}{2}$ in.

AN opinion prevails very generally in England, among many who hear of the modern painters of Germany, but are unacquainted with their works, that their usual character is dry, conventional, and altogether unlike those of other countries. This is true to a certain extent only: many of the most distinguished German artists are undoubtedly amenable to this charge; they regard less the manner than the matter of their pictures, and aspire to attain excellence in expression, sentiment, and spirituality, rather than in poetical conception and richness of colouring.

Edward Steidle is a native of Vienna. He it is who, with Kupelweiser and Fübrieh, has a reputation among the most popular German painters of sacred subjects. He studied in his native city till about the year 1828, when he left it for Italy, returning in 1834. During his residence in Rome, where he formed an intimate acquaintance with Overbeck, he commenced a large picture of the "Descent from the Cross," which was not completed till some years after; "St. Ignatius and the Virgin Mary," a work of smaller dimensions; "St. Alphonse de Liguori," and some others. "One of his most remarkable works," says Count Racinski, in his "*Histoire de l'Art Moderne en Allemagne*," "is the 'History of Sta Maria, the Egyptian,' in the style of Giotto's 'St. Anthony and St. Paul,' at Campo Santo." On Steidle's return to Vienna he painted the "Five Angels of the Apocalypse," "Nathan before David," "Jacob wrestling with the Angel," and "St. Luke painting the Virgin"—a work of the highest quality, fine in conception and execution.

We object to the name which Steidle has given to the very charming picture here engraved. If he had adopted some such title as, "One of the Old Painters studying the living models for a picture of the Virgin and Infant Jesus," it would have been more appropriate. Its present title is not a "truth," and therefore would assuredly call down upon the head of the offending artist the wrath of Mr. Ruskin, who calls Raffaele's glorious cartoon of the "Charge to Peter" a "monstrosity and hypocrisy," because the fishermen of Galilee are not wearing the clothes in which they are presumed to have been dressed amid the "sea-mists and on the slimy decks." Steidle's picture is even fuller of "mistakes" than Raffaele's. First, St. Luke was a physician, and not a painter: the report of his being the latter originated with Nicophorus Callisti, a writer of the fourteenth century; but it is not known on what authority, and is now justly exploded as destitute of foundation and countenanced by no ancient authority. Secondly, supposing him to have been an artist, it is evident he could not have been acquainted with Mary as a young virgin mother, and with Christ as an infant—for St. Luke went with St. Paul to Rome, A.D. 63, where he remained two years. Again, the accessories show more than one anachronism: the covering of the table is a modern Venetian carpet, and the vase with flowers in it is glass of a comparatively recent date as regards form.

Apart, however, from these considerations, Steidle's picture is, as the German critic observes, "a work of the highest quality." The face of the Virgin is exquisitely beautiful, soft in expression, and truly feminine. The child is a lovely representation of infancy: these two figures are skilfully grouped. St. Luke is seen in profile—a fine manly figure, whose head, strongly marked with the Jewish expression of feature, is brought out in bold relief against the sky. The colouring of the work is very rich and powerful. The Evangelist wears a dark green coat, or tunic, over which is a dark crimson robe; the Virgin is clothed in a light greyish-blue robe, beneath which is seen a portion of a scarlet dress; the curtain is rich brown, except that part immediately behind the Virgin, which is red, embroidered with gold; the ground of the table-cover is green, corresponding, or nearly so, with the tunic of St. Luke; and the sky is tinged with the golden hues of evening.

The picture is in the collection at Osborne.

BOARD OF TRADE BUILDINGS
ON THE KENSINGTON GORE ESTATE.

At the close of the Exhibition of 1851, various objects contained in the four sections of raw produce—Manufactures, Machinery, and Fine Arts—were presented to the Commission by their exhibitors and owners. These were temporarily housed in the venerable palace at Kensington, with the exception of the Colebrook Dale gates, valued at £1500—an example, of some mark, of a subject's gift to the Crown, for which an appropriate place was at once found on the south side of Kensington Gardens. The collection thus formed comprised examples of great interest and utility to the public: such as arranged collections from different localities of special materials and vegetable produce, and of novel natural substances offering additions to our materials of commerce; also models of improvements in machinery, and specimens of manufacture, and some few Fine Art works, chiefly, however, illustrative of the latter class. Since the closing of the Exhibition, these have not been available to the public. Partly for the purpose of receiving these specimens under such arrangements as to give the public the full advantage of them, the museum building at the Brompton end of the Kensington Gore estate was proposed, and £15,000 voted by Parliament. This edifice is now enclosed and covered in. Its area is 266 feet by 126: the height being 50 feet in the centre of the three longitudinal arches that, side by side, form the roof. A gallery of a third of the width along the sides, and somewhat less at the ends, at 20 feet from the floor, surrounds the interior, leaving an area in the centre of 210 feet by 42 of the full height of the building. The structure is of iron and glass. From the appearance it presents towards the south, it has been christened by some of our contemporaries "the Brompton Boilers," and with every desire to be favourable, we are sorry not to be able to say anything to mitigate the sarcasm. The exterior has neither novelty nor beauty to recommend it. We hope, therefore, no sacrifices having been made to obtain these qualities, that utility and special aptness for its purpose have been attained in the interior—of which, however, we do not feel confident.

Viewing with great interest the steps taken by the sanction of Government in the development of Art in connection with the substantial interests of the country and general education, we would much rather have to give praise than withhold it; and we cannot but view it as peculiarly unfortunate that the first structure presented to the public at Kensington, by what may be viewed as the Government Department of "Taste," should afford so little evidence of that quality, and that it should not be in advance (to say the best of it) of an average "railway terminus."

We take this opportunity, however, as regards the late progress of iron and glass architecture generally, to express our surprise at the little advance it has made, in an artistic point of view, since its first general use in railway stations, and in the Exhibition building in 1851, notwithstanding that the materials lend themselves readily to the utmost scope of form. When we look, for instance, through the pages of such a work as Mr. Ferguson's illustrated epitome of architecture of all climes and times,—whichever artist should possess,—we behold a vast variety of outline, which these crystalline materials might well rival by modified imitation. When we turn from these to our practice, even in the Sydenham Palace, we see but repetitions of the familiar flat roof and transept. Not a minaret or dome of novel or beautiful character rises in the air to vary the sky-line, or give interest to the edifice; and this, although iron and glass possess far greater capabilities for attaining that lightness and freedom of effect usually sought in such enhancements of a structure, than the more ponderous materials at the disposal of the architect of former times. We should be glad also to see stone, and brick, and marble more intimately combined as a style with iron and glass. For instance, although the Kensington Gore Museum might appropriately have had an iron roof and galleries, it should have had a stone front, and at least stone and brick walls. The Sydenham Palace would have been better if more stone and brick and less iron had been used in

its construction, and would then have been in truer harmony with the stone terraces, balustrades, and granite steps which lead up to it. These remarks indicate an apology for the "Brompton Boilers," only in as far as they show that they have companions in their shortcomings. We had much rather, however, have had to point to them as an honourable exception from the general want of progress we observe in this respect throughout the country.

But to return to Kensington:—Besides a selected portion of the contributions presented to the 1851 exhibition, the museum building will afford space for the collection of specimens of ornamental Art belonging to the department, and formerly exhibited, in Marlborough House; also for the newly acquired "Soulage" collection, &c.; and we have heard reports of the probability of more than one addition of collections of the highest value in Art to the interest this spot will hold out to the public; but we refrain from placing these before our readers at present, as the arrangements in regard to them are in neither case as yet completed; we shall, however, watch any movements that may occur, and report proceedings for the information of our subscribers.

In immediate connection with the museum building, not however opening out in the same direction, but abutting against the "Exhibition road" (one of the two great ways leading from Hyde Park in the direction of Brompton), the special schools of instruction of the department are being erected. Some of these are mere removals, consisting of apartments originally but temporarily constructed at Marlborough House, and now re-erected identically in their new situations. They consist of class-rooms, store-rooms for casts and examples, lecture-rooms, &c. To these are annexed such additions as improved facilities in Science and Art are hourly affording; and among these is to be a special apartment for photography. The Sappers and Miners (under the peaceful influence of Art) are turning, indeed, "the sword into the reap-hook," and make excellent photographers. Church, who accompanied Dr. Barth on his journey to Timbuctoo, is now among the corps retained at the new structure—and this is not a bad instance of the readiness the department has to gather round it people of intelligence in various ways.

From what we have said it may be noticed that the buildings of the museum and schools now in course of completion are of a somewhat temporary character, and to be viewed rather as an experimental than a permanent nucleus of arrangement. In one broad regard they claim praise: the policy of the administration being to group in one scheme, and locate together, scholastic instruction with those objects of Art, from the lowest to the highest class, as will best serve to illustrate the various departments to which the student's attention may be directed.

Viewing as a whole the establishment of the Museum and Schools at present forming on a corner of the Kensington Gore estate, it presents itself to us, under existing circumstances, as affording a *trial*, voluntary or involuntary, of that locality for Art-purposes; and we cannot but perceive that the eventual development, on this site, of the scheme of Art and Science, for which it has been proposed, may be much influenced by the hold the early administration of it may take on the public. We have no doubt that the intelligent heads that have the practical direction of the department are fully alive to this view of the question, and of the importance in this respect of the steps they are about to take. That these will be judicious and energetic we have little doubt. For this they possess the advantage this year of having no Paris exhibition to prevent them from concentrating their undivided attention on the subject before them. Beside, but hand in hand with, the more special and obvious duties of their office, their policy will be, doubtless, to enhance the public interest of their establishment by every legitimate means within their power, and to accustom the public to the association of Art with the locality they now occupy. We have registered our belief in this being the best that has been suggested for the large Scheme for which it was originally purchased; and we have good hopes that the steps to lead the public to fully recognise this will be taken with due thought and discrimination.

ST. LUKE PAINTING THE VIRGIN

FROM THE PICTURE IN THE ROYAL COLLECTION

THE CRYSTAL PALACE,

AS A TEACHER OF ART AND ART-MANUFACTURE.

PART V.

We last month made some reference to the Crystal Palace as a means of wholesome and rational enjoyment to the working classes, and expressed a hope that means would be devised thus to minister to their pleasure and instruction. The proposal has been in a measure tested, and with entire success. Early in September the "Early Closing Association," by their excellent and indefatigable secretary, Mr. John Lilwall, resolved upon illustrating the practical working of the "Saturday Half-holiday Movement" (a branch of the Association), by issuing an invitation to all who were thus indulged to meet at the Crystal Palace, and to spend there the afternoon and evening of the day. The result was an assemblage of people approaching twenty thousand; and it was most gratifying to note the good order, steady procedure, and close observation that prevailed throughout the masses thus brought together for recreation. Nothing whatever occurred to disturb the harmony of the occasion: it was an experiment which must be an example—for, while there was ample evidence that all parties were amused, it was certain also that the great purpose of education was at the same time advanced. It is to be recollected, however, that this assemblage was not, strictly speaking, one of "the working classes,"—a large majority of those present were the young men and women employed in warehouses, and shops, and offices in the cities of London and Westminster, and the suburbs of both. But it is on this very account that the meeting is especially cheering. In the early stages of the Early Closing Movement, the great obstacle encountered by the committee—and by Mr. Lilwall, who then, as now, was its earnest advocate—was the argument, generally based on conviction, that if young men were released from labour before nature

became exhausted, the hours placed at their disposal would be misspent, to say the least—perhaps spent in evil company and dissipation. This difficulty it was almost impossible to overcome. Attention was continually directed to the many changes that had taken place of late years, by which young men were afforded opportunities of passing evening hours profitably at societies and institutions, established in every district of the metropolis and throughout the kingdom, and that social habits had become far more rational than they used to be. A concession, alike demanded by policy and necessity, was withheld on the ground that it *might be abused*. Happily this opinion, if not entirely gone, has been materially altered: proof has been had that instead of the young persons who have been released from over toil abusing the indulgence, the hours placed at their disposal have been used to obtain information, rest, or agreeable and innocuous pleasure—pleasure being, we believe, as necessary to life as food or sleep. And the latest fact to be recorded, that of eighteen or nineteen thousand persons meeting at the Crystal Palace without the occurrence of a single instance of broil or even confusion, will go far to remove all doubts that the Saturday half-holiday, and the "closing" at reasonable hours, are boons that may be accorded without the least danger to, at all events, one of the parties interested in the discussion of the subject. To us it is clear that the employer, as well as the employed, will be benefited by a change we confidently expect to be ere long universal throughout Great Britain. But this is not the place in which this view is to be advocated; we may content ourselves with reference to the proceedings at the Crystal Palace on the Saturday evening referred to, as affording indubitable proof that the working classes may be safely trusted to seek for themselves occupations for hours of leisure after labour, and as evidence that in the Crystal Palace the country possesses a teacher more effective for good than any that can be appointed by the legislature.

We earnestly hope the Directors will adopt some plan by which their "school" shall, on the afternoon of every Saturday throughout the year, be placed in a measure at the disposal of young men and women, such as those who studied there on the Saturday in question.

We cannot lay too much stress on the improving influences exercised in every part of this wonderful structure: the gardens, redolent of health, are pregnant with instruction; the plants and exotics collected within are of the rarest interest—here are the palm-tree, the cotton-tree, the sugar-cane, the tea-plant, and a thousand other productions of ever-beautiful nature, each one of them an instructor. Birds of various countries are seen in their brilliant plumage; the water contains abundant examples of aquatic marvels—an aquarium, in extent and variety unparalleled in the world, "within doors." The several Model Courts, the Industrial-Arts' Courts, the sculpture everywhere, and especially the Picture Galleries, are teachers of incalculable value at the present moment, when even the very humblest orders are learning something concerning the sources of that pleasure which is derived from beauty, and are gradually acquiring a power to appreciate excellence in Art. On the occasion to which these remarks principally refer, there was no part of the Palace so continually thronged as the Picture Gallery, nor was there any portion of the immense treasure submitted to the gaze everywhere, from which the people appeared to derive so much enjoyment.

The Crystal Palace, therefore, becomes daily more and more a great instructor of the public; and if the nation be called upon to adopt this means of enlightening while gratifying the people, the nation will only discharge its duty by answering such an appeal. There is no way in which a parliamentary grant could be so beneficially expended; and if some member of the House would boldly propose a measure of the kind, we feel assured of its being warmly responded to.

THE FOREIGN COURT, CRYSTAL PALACE.

The Court we introduce on this page is named THE FOREIGN COURT, and it is made in some degree to answer its design:—to which is brought, and

where may be examined, the minor Art-productions of the Continent: of a surety, however, it is not yet what it may become, for its contents are of a very

secondary order—the object being less to show than to sell. Nevertheless, it is well filled with curious and interesting objects—the produce, chiefly, of

Germany and France; and, regarded as a private speculation for profit, the Court is not unsatisfactory.

The Director here is Mr. Holt: it is, we believe, his establishment; and its contents are very varied. To enumerate a few of them:—fauciful inkstands in great variety; jewel-trays; articles in which the "*coque de perle*" is advantageously introduced; caskets, fitted for work, perfumes, or cigars; jewellery, real and imitative; enamel paintings, mounted as brooches, &c.; flexible baud bracelets: carved ivories from Dieppe and Frankfort; the oil-prints of Baxter, and coloured lithographs; scent-bottles; filagree-work; tortoiseshell and pearl-work; writing and card-cases; French and Birmingham bronzes; jet ornaments of all kinds; parasols and fans; leather goods, ornamented and perforated; clocks, toys, perfumery, &c. &c. &c.

It will thus be observed that THE FOREIGN COURT is a "*mixtum gatherum*," as perhaps it was intended to be. It is, as we have said, a place for sale, and has been liberally supplied with matters of all kinds that tempt the visitor to carry away a memorial of the visit. But we shall hope to see

mingled with the ordinary articles of trade a better display of those Art-elegancies which, although more costly, cannot fail to find purchasers.

The Court, as will be seen by our engraving, is very elegant: light and graceful in character, and skillfully decorated; a sloping roof contains the names of the several commercial cities and countries of Europe; and altogether it is one of the attractions of the place, which those who enter do not leave without bearing away some reminder of the pleasant day they have passed within the building.

We resume our visits to the CERAMIC COURT.

We have selected for our first illustration a series of the early FLAXMAN-WEDGWOOD WARE, from the large and beautiful collection, comprising some hundred specimens, lent by Mr. ISAAC FALCKE.

The examination of these works will justify the high prices which they now realise. Nothing can exceed their artistic merit, both in design and manufacture; indeed, the latter feature is in some respects quite marvellous. The smaller groups upon the cameos may fairly rank as Art-productions with the finest gems; and those who are aware of the difficulty of executing such works as a *manufacture*

through the ordinary agencies, will duly estimate, not only the high order of the mind to which their conception is due, but the value of the superintending vigilance that could realise so perfect an embodiment. Josiah Wedgwood was the *creator* of all his successes. He found a manufacture devoted to the productions of the ordinary articles necessitated by domestic usage, and these executed in a manner such as was considered suitable to their purpose, and the moderate price of their remuneration. Elevated by the promptings of a superior intelligence, and urged by the facilities which the processes in operation presented, he determined to originate a new field of action, in which the highest capabilities of Art should find scope for ample development. Surrounded only by the ordinary class of workmen of that day, and with the ordinary materials, he applied himself to chemical research, so as to invent and perfect new compositions of pastes and glazes—obtained the services of the illustrious Flaxman for designs and models, and produced a class of work which not only ranks in the highest branch of Art, but marks the proudest epoch in Ceramic manufacture.

GROUP OF EARLY FLAXMAN-WEDGWOOD WARE.

Amidst difficulties which to ordinary minds would have been insurmountable, he created a superiority which is alike the boast of the past and the reproach of the present; and this too without the stimulus of ultimate appreciation, even when perfected. Indeed, it is evident that he did not rely on native patronage, for the catalogue of his finest works was only printed in French for foreign circulation—so hopeless was he of any appeal to home sympathies.

Though meeting, in some respects, much encouragement in England for his ordinary productions, it was abroad that he found recognition and remuneration for those works upon which his fame is based, and by which it will survive as long as pottery exists and Art is valued.

In this collection will be found a large number of his jaspers of various colours—Egyptian red and black, &c.; Vases, including one of the original copies of the Barberini, or Portland Vase; a service of Egyptian red, mounted in silver, formerly in the possession of Queen Adelaide; candelabra, plaques, busts (one life-size of Mercury), cameos mounted as caskets; watches and brooches, together

with a number of specimens of tea-services, &c. &c. We strongly recommend this collection to the examination of all lovers of Art, and especially to those connected with manufacture. The manifestation of a success so marked, cannot but be highly stimulating to those who appreciate the efforts of a refined intelligence allied to commercial industry.

The firm of RIDGWAY, BATES, and Co. (Staffordshire) represents a manufactory of long-established position. Its efforts have hitherto been chiefly directed to the class of goods (porcelain and earthenware) in general demand, and to the production of them in a degree of more than ordinary excellence; it may justly claim peculiar acknowledgment. In respect to the *material* part of the manufacture, that is, the quality of "bodies, glazes, colours," &c., this firm is deserving of high commendation, indeed, we may fairly state the very highest. Considerable tact is displayed in adapting these appliances to such efforts as meet a large patronage; but with such chemical and mechanical success as these display, it is a matter of regret that we miss the exercise of a higher order of Art in its productions; and this, we think, is alone wanting to develop

fully and signally the value of the productive resources this house so eminently possesses. The cost incurred in the production of many of the examples exhibited by this firm proves that it does not begrudge expenditure in its aim for improvement, but simply errs in its application. The collection from which we have selected the objects engraved in this group comprises vases, tea, dessert, table, and toilet services in porcelain and earthenware, enamelled and gilt.

MR. W. BROWNFIELD (Staffordshire) restricts his manufacture to earthenware; but this in very excellent material, and in varied styles of decoration, enamelled, gilt, and printed. The class of pattern exhibited is uniformly creditable in arrangement, and in execution very commendable, affording another satisfactory evidence that the manipulative processes of our manufactures are thoroughly understood.

Before concluding our notices of the Ceramic Court, we are induced to give expression to the conviction which examination of the various works it contains has forced upon us, and which our experience beyond its limits fully confirms.

The importance which attaches to a manufacture,

whose exports alone are valued at a million and a quarter, is sufficient to enlist our sympathies, independently of the associations connected with its time-honoured and deeply-interesting processes.

Comparatively few are aware that there are upwards of one hundred and eighty manufacturers of pottery in England, scattered through Leeds, Swansea, Glasgow, Sunderland, Stockton, and North Staffordshire; of which number upwards of *three-fourths* are located in the latter district, in which more than sixty thousand persons are directly employed in this fabrication.

It is remarkable that among so great a number there are so few that have any recognition beyond the immediate area of their operations. Their products are chiefly of a very coarse and inferior kind, for which their utility and cheapness alone ensure a demand.

Though specially an Art-manufacture, evidences that it is so are lamentably restricted; and a very few names will exhaust the catalogue of those who are worthy to rank as its exponents.

It may be argued that this is not exclusively the position of ceramic manufacture, but rather that it is the state of *all* manufactures. To some extent this must be admitted; but the status of a manufacturer in respect to Art must be judged relatively to the facilities it offers for the combination. Now, with none can Art be more cheaply connected than

with that specially under review. The material of trifling value, presenting from its plastic nature facilities of application to forms of elegance, either plain or enriched, by processes as varied as they are rapid—every feature presenting an inviting medium for the exercise of Art-intelligence. We shall allude more particularly to these points as we proceed.

We have already at some length pointed out the value of the productions of Sèvres, Dresden, Vienna, St. Petersburg, &c., which this collection includes—a value we estimate simply from their artistic excellence, for we are uninfluenced in our judgment by the seemingly fabulous sums that attest their commercial estimate. Our manufacturers will do well to study these works, which fully warrant the fame attending their production.

We have also commented upon the eminent works of Minton and Copeland, so well represented in their examples here; and also have referred to the revived fame of the Royal Worcester Works, which promises, under the present enlightened proprietorship (Kerr and Binns) to surpass and eclipse the brilliancy of their former triumphs. Still at the same time we must lament that in reference to the higher or even ordinary qualities of Art, how few there are among the great number of English manufacturers who can justly claim an acknowledgment worthy of approval. This arises not from the costliness of Art-application to the necessities of the

manufacture, but simply from want of its appreciation.

Now, as regards form in outline, the regularity and beauty of curve—such as we note in the early Greek vases—is *more easily* attainable as a mechanical result than the disjointed and eccentric shapes which modern pottery so frequently presents.

These caprices are not the results of accident or negligence, but are attained often after a prolonged exercise of perverted ingenuity. They are produced with malice propense and aforethought, as though men had determined to bestow pains upon the creation of ugliness. This could not happen if the manufacturer and artisan possessed that educational preparation which the province of all Art-labour requires from those who would creditably and successfully enter into its field of action; and it is this preparation, resulting in the feeling and expression of Art-intelligence, which so materially enhances the commercial value of the products to which it gives rise.

The pottery to which we have referred, that of ancient Greece, affording examples of marvellous grace and beauty, is, as regards the value of the materials and cost of production, but of trifling and inconsiderable amount; its real value consists in the evidence it presents of the application of classic taste and refined feeling to objects devoted to purposes of familiar and humble requirements. The

GROUP OF PORCELAIN: RIDGWAY, BATES AND CO.

allotments and subdivisions of labour in England into sections of different branches of manufacture, confining the artisan to a fractional part only of a work, though it facilitates the operation of production, and secures a greater uniformity of executive detail, are a heavy hindrance to his mental growth and intellectual development. The narrowness of the channels to which his powers are restricted materially tends to confine and limit the capabilities of their action. It, therefore, becomes the more imperative that those under whose guidance his efforts are set in motion, and influenced, should be duly qualified for their direction.

That the general standard of English taste must be rated as still lamentably low, even allowing for recent and gradual, though obvious improvement, is a mortifying fact, and to attempt its denial is but to perpetuate the evil we deplore. It "cryeth in our streets," and stares from our shop-windows. If, as is urged, the degree in civilisation of a country be denoted by the class of goods required for export to its markets, then our continental dealers, judging from the worthless trash with which to such an extent they crowd our arcades, bazaars, shops, and sale-rooms, and which finds a too ready sale, must indeed deem us in a barbarous plight.

We saw, a few days since, a large importation of French and Saxon porcelain, of so vulgar and offensive a description that we at first doubted the possi-

bility of its being the products of those manufactories; but we were assured by the proprietor, with much self-satisfaction, that he had been expressly to Paris and Dresden to select the stock, and that it was such as would *exactly suit the English taste*. He had mistaken our surprise for admiration, and we feared his experience was too well grounded to risk a discussion with him.

This fact is quite understood abroad, for during our visit to Paris, in 1855, at the time of the Great Exhibition there, having remarked upon some clocks in ormolu exposed in a shop window at a ridiculously low price and of a proportionably low taste, we were deprecatingly assured by the fabricant that they were expressly manufactured "*pour les Anglais*," who were coming over in great numbers, and would take advantage of their visit to evidence their judgment in the patronage of these examples of the superiority of French Art.

Now, it would be futile to assume that good taste is exclusive, even in France—this is far from being the case, but it is more diffused and more *assumed* than in England. France knows and duly estimates the value which she derives from her admitted superiority in this respect, and whether sharing in that quality or not, her children do not hesitate to lay claim to it as a hereditary right. The remark so often heard from Englishmen, even in educated classes, that they "know little about Art, and care less," uttered rather as a boast than a reproach,

never yet escaped Gallic lips. Assumption, in many instances, it may be, and undoubtedly is, still it becomes a merit—it is a tacit homage to the value of Art itself, and is impulsive, in its general influence, on all connected with its operations. Such a condition of mind at least gives room for hope.

England's manufacturing success, great as it is, depends chiefly upon mere mechanical power and manipulative facilities, and not upon artistic excellence. We submit there is little security in such a position. Mechanical resources are not patent to any particular country, and their application may become as general as policy dictates. As regards the "artisan," also, we would earnestly warn him against a blind dependence on the permanence of any operative process in our manufactures which involves merely *manual labour*. Mechanical science is now so fast supplying the demands of merely manipulative requirements that it is impossible to speculate upon its limits. If, in their own case, the time is past for improvement, still let them at least make provision for a better qualification in their sons—more honourable to their humanity, and more serviceable to themselves and their country.

The greatest successes of which we boast in our Art-manufactures must be attributed to foreign origin. France finds herself fought by us with her own weapons. Artists and artisans, cradled and reared in her ateliers, are transplanted to exert the strength which she has created and strengthened

against its author. The Exhibition of 1851, great and important in its results as it was, proved from this cause quite inconclusive as an evidence of comparative national merit.

There is no weight in the argument that in some branches of manufacture France has sought and obtained help from England's workmen; it is the principle involved that we declaim against, let its exercise be admitted where it may. So long as such means are resorted to, and we are content to shine through borrowed light, we may despair of any innate lustre.

Discrimination in the commercial value of foreign talent and enterprise in offering the means to secure a transfer of its advantages our leading manufacturers may lay claim to, but, with few exceptions, little beyond. Is it not possible for England to realise an *original* success from her own national resources? Is she ever to remain content with reproductions by French agency, or feeble imitations by her own? In ceramic manufacture she has demonstrated her capability for both these positions. In Wedgwood (the Flaxman-Wedgwood) an *original* success, alike individually and nationally honourable, was achieved; while our present potters, with a few eminent exceptions, are content to realise the second category.

We repeat that if the practicability of an alliance between Art and manufacture be more intimately and completely demonstrated in one class of industry than another, it is in ceramic productions. Involving the elements of form through a medium presenting special and varied means of decorative

facility, it stands unique in its presentments. For illustration of this fact examine some of the finest works of Sèvres and Dresden—particularly the best modern productions of Sèvres, executed for exhibitive purposes. Now there is nothing mysterious or unaccountable in the marvellous beauty of these works; the means taken are precisely those which must naturally lead to such results, and without which they could not be attained. Reference to the production of one important work will explain what these are. Let us instance that of the Grand Vase commemorative of the Exhibition of 1851, exhibited at Paris last year in the collection from Sèvres, and subsequently presented to Prince Albert by the Emperor Napoleon. By visiting the manufactory during its execution, we became personally acquainted with its progress.

First, we saw the sketches of the primary studies for the composition—light and shade, &c.; then the drawings in tempera for arrangement of colour; and

subsequently, an elaborately-finished painting in oil of the complete work. Now, through these different stages, the work of accomplished and eminent artists, the advantages of enlightened and competent criticism had been secured; so that during its progress it had been submitted to as severe a scrutiny as could possibly await its completion, and thus, before its transfer to porcelain, it was a matured and finished conception.

Can we wonder at the superiority of a work so produced, over the premature abortions which, hasty and inefficient in their primary stages, eventually involve a disproportionate and unsatisfactory amount of labour?—and under this head must the bulk of English Art-products, even of the more pretentious character, be classed.

That the influence of Sèvres has not been so marked upon the French manufacture generally as might have been presumed, we conceive to be caused by the secrecy with which the operations have been carried on. Successful experiments, realised at *national cost*, should be *nationally available*. Publicity as to the operation of any new process should be immediate on its perfection; and thus, by advancing the general standard of the national manufacture, would the cost of its attainment be indirectly reimbursed. It is a favourite assertion with those to whom Art is unfelt, and consequently unappreciated, that such works are not remunerative: this, in some degree, arises from the fact that large sums have been occasionally expended upon the execution of works intended as Art-illustrations, in which the elements of Art have been

GROUP OF DECORATED EARTHENWARE: MR. WILLIAM BROWNFIELD.

outraged through every feature: and because the general feeling has repudiated such perpetrations, the manufacturer exclaims against the want of patronage and public appreciation. Why, they are appreciated—*justly appreciated*—and *condemned*. We believe that, directly or indirectly, the production of works in any branch of manufacture of acknowledged superiority to previous achievement in that branch, must exercise a valuable prestige in favour of the general manufacture of the producer, and is not restricted to the mere gain upon that individual work.

In the articles of ordinary manufacture, such a course as that referred to in the production of the Sèvres vase would be superfluous, the decoration suited being of a light and facile character; but experience proves the value of some such preparatory study, even in reference to productions of this class—for it is found that the best Art-worker can do the inferior work in a better style, and at a lower rate, than inefficient hands: this results from a thorough knowledge of his trade giving him a ready and decisive power in lieu of dilatory and hesitating weakness.

Though Art-appreciation is lamentably but the feeling of a small minority in England, still it includes sufficient with means to reward those who minister to its enjoyment. The diffusion of wealth in England happily in some degree compensates for the restriction in taste; and consequently, instead of works of Art being scattered generally over our districts, or amongst the members of communities in individually limited numbers, we find them in

special localities, concentrated and absorbed in large and costly collections. The liberal feeling which now generally influences the possessors of these Art-treasures to grant them for public exhibition, and thus extend the elevating influence which such works exercise, will do much for the educational advancement of England. It is the spread of this feeling, and the impulsive action to which it would give rise, that alone is wanting to complete and perpetuate our manufacturing success.

That the French are alive to our *manufacturing* excellence is shown by the large and increasing demand for English porcelain, notwithstanding the heavy duty and expenses attending its import. This demand, however, is limited to patterns of a very slight character, effected by printed outlines, coloured by women and children. Those which our manufacturers plume themselves upon as of a higher class, find no encouragement there, and for two reasons—first, their merit does not equal their pretence; and next, the price (from this cause) is considered excessive. Art is comparatively cheap in France; it is there a *necessity*, with us a *luxury*.

The patronage given to English earthenware at the Paris Exhibition last year amounted to a "rage." This pottery, which was under ordinary circumstances prohibited, by a concession of the Imperial Commission was admitted for exhibition duty free during that period. Although twenty per cent. was charged upon sales effected, the French not only bought up the whole available stock, but large orders were also executed during the whole time that the exhibition remained open. The sale of

Minton and Copeland's porcelain has long been very considerable, and within a few days the Worcester manufactory has received large orders, including some thousands of pieces of its famous egg-shell porcelain. Our present superiority in *manufacturing* excellence over the bulk of the French producers is unquestioned; and it is a matter of sincere regret that indifference to Art appreciation should allow that success—which might be complete and permanent—to remain but partial, and, we fear, temporary.

England must not imagine that other countries will not emulate her mechanical facilities. The improvement in the manufacture of earthenware in France (comparatively of very recent establishment) is most remarkable, and it will ere long enter into important rivalry with our own; let English potters so prepare themselves as to meet it with credit and success. What might not the general operation of such a mind as influenced the great Wedgwood now effect in our ceramic manufactures! Will not English manufacturers more generally emulate this glorious example? With extended and improved resources—with the increased facilities which the advance of Science and Art have placed within our grasp—with a marked improvement in public taste (deficient as it still is), will our manufacturers be content to refer back to the vigorous triumphs of past achievements?—amidst the feeble inanities of present incapacity, heedless of the inference which such a position involves, and the result to which it will inevitably lead. Yet too many are content with such a position—conviction may come too late.

THE MANUFACTURE OF PAPER.

THE superior position of man in the scale of created things, is in no respect more strikingly manifested than in the desire which he has ever displayed to convey his ideas to others by material signs.

There is evidence of the exercise of thought in every individual—with a healthful organisation—of the most uneducated of the wildest tribes. Beyond the operations of instinct we constantly find a rude system of induction at work, and, as the result of the advances of man by the aids of sense, we discover the influence of mind in the attempts to give permanence to those truths—or supposed truths, which have been *thought out*. The great events which have occurred amongst the migratory tribes of men have been recorded upon inscribed stones. The face of precipitous rocks, far beyond the reach of injury by the wilfulness of men, has been carved with legends describing the wars of nations; and on the walls of the tombs of the Egyptians we read the biographies of the dead priests and warriors. The Assyrian temples in like manner record the great adventures of the mightiest hunters, and the most destructive of their heroes.

Pictured story, and symbols of various kinds, the result, even in their rudest form, of much thought, mark in permanent characters the progress of intelligence. The increasing desire of man to record, and to have the means of referring to records, is displayed in the curious inscribed cylinders of the Assyrian and Babylonian people. These appear to have their special histories, and to have been worn, as beads are now worn, on the person, so that the records of the deeds of their heroes were constantly before them to incite to yet more noble achievements. The moulded and impressed tablets are yet another form of record; but these appear to have been employed for the great matters of law and government.

Whether we examine the earliest evidences of man's works which Asia affords, or those rude examples of early civilisation in Central America, the runic inscriptions of Northern Europe, or the hieroglyphics of the cultivated Egyptians, we must be impressed with two or more facts.

The earliest men thought that deeds had been accomplished by them which would stimulate other men to imitation if they were recorded as examples; and they exerted their mental powers to devise the means of informing the stranger, and those yet unborn who would eventually occupy their place on the earth, that great men had lived, and that noble deeds had been done.

The advance from gravings a sign upon soft clay or on solid stone, to marking the leaves of trees, was easy; but nevertheless it was most important. Men naturally would seek out those plants which yielded, either in the size or texture of their leaves, or of their barks, the best fitted material for their use: hence the discovery of the *papyrus*, and all the methods by which it was prepared for the use of the scribe. The skins of beasts, too, would offer convenient surfaces upon which, with a properly prepared dye, the signs for ideas could be painted or stained. The history of these discoveries is sometimes written with all the appearance of fidelity; but with the advances of knowledge we are led to believe that they all belong to a much earlier date than that to which they are usually referred. It is not our intention, however, to enter into any examination of this part of the subject. With the accumulation of the records of thought, the value of those records became more apparent, and there was naturally a desire kindled amongst men to possess the stories of the his-

torian and the songs of the bard. Hence the advance to prepared leaves—such as we find in the rolls of antiquity, which have been preserved to us, and gradually from the inconvenient roll to the bundle of leaves, and thus to the bound book.

Vegetable fibre admits of being beaten thin and spread out uniformly—of being deprived of its colour, and smoothed or glazed upon its surface. Thus arose the manufacture of paper, on which we desire to say a few words. With the increased demand for printed and written sheets, the manufacture of paper has become more and more important over almost every part of the world, and every variety of vegetable fibre has been employed in preparing it. The great source, however, of the paper which we employ in our printing operations, and for writing, is linen rags. It would be more strictly correct to say that this should be the source: unfortunately, paper is now largely prepared into the composition of which but little linen fibre enters—and the result will be the comparatively early destruction of many a record which it is important should be preserved.

Let us examine, in the first place, the operations of a paper manufactory, and then proceed to remark upon some of the defects for which it is most important remedy should be found.

Rags are collected from almost all known parts of the world; the Italian beggar and the German peasant furnish much of the material for fine writing paper in England. A large export trade in rags is carried on at Hamburg and Bremen, from Ancona, Leghorn, Messina, and Palermo. The exportation of rags is almost prohibited in France, Holland, Belgium, Spain, and Portugal; these countries requiring all they can produce for their own paper manufactories. Few persons think of the value of a rag, yet so precious is the waste fragment of a shirt, that strong legislative enactments and prohibitory duties regulate its sale. Rags are, however, obtained, and the operation of paper-making commences. We must first introduce the reader of the *Art-Journal* to a room full of dust and dirt, and bags of rags, in which are a number of women employed in sorting. Each female stands at a frame, which is, in fact, a wire sieve, at one side of which is a knife, placed usually upright. A handful of rags is placed on the wire frame, and they are shaken to and fro to free them from dirt. They are then sent into pieces about three inches square, and thrown, according to their quality, into one of three compartments, which are on the right hand side of the table. All the seams are placed by themselves, as the threads require more grinding to reduce them to a pulp than the other parts—buttons, hooks, &c., are all very carefully removed. When properly cut and sorted the rags are packed in bags, each containing one hundredweight, and sent to the washing shed. All dirty and coloured rags are placed in large tanks with lime, and boiled, usually by admitting steam under pressure into the bottom of the tank: by this the whole is kept in a state of violent agitation for some time. After this boiling operation the rags are removed to the *washing-engine*; or, if the rags are already white, they pass to the washing engine without the previous boiling. The washing-engine is a trough about ten feet long, four or five feet broad, and two or three feet deep; it is made of wood and lined with lead; in this is fitted an iron roller, with bars or knives projecting radially about an inch. The roller is set in motion, and one hundredweight of rags are put into the trough, and as much water as will raise the whole to within an inch of the brim. Beneath the armed cylinder is a plate with knives of the same kind as those on the roller. The revolutions of this roller, which are about 160 a minute, carry the rags with

great rapidity through the knives; and as the roller is depressed upon the plate, or elevated, so are the rags drawn through and cut or bruised. Adjusted above the roller is a cover, in which are frames of wire-cloth, communicating with the pipes through which the water is supplied. The mass having been agitated for some time is carried up an inclined frame, and subjected to the action of a stream of clean water, at the same time as all the foul water is carried off by another pipe. By this operation the rags are cleansed and bruised down. When they are sufficiently white they are removed to a press for the purpose of squeezing out the greater part of the water which remains in the mass. Foreign rags commonly, even after this operation, retain some colour—the mass having the appearance of brown holland. To free this of colour bleaching operations are had recourse to; these are purely chemical operations, depending chiefly upon the action of oxygen on the colouring matter. The rags are removed to a wooden chamber in a moist state; this chamber, from which all air is excluded, is connected by pipes with a retort in which chlorine gas is generated. The black oxide of manganese, common salt (*chloride of sodium*), and sulphuric acid are mixed together, and heat is applied. In this process the chlorine is liberated, and this intense yellow gas passes into the wooden chamber: here it meets with water in the moist rags, and it seizes immediately upon the hydrogen of the water; the oxygen, in its nascent state, combines at once with the colouring matter and destroys it. The operation of bleaching requires great care, since there is a liability to destroy the linen fibre by the action of the acid. It is important, too, that every portion of chlorine should be removed from the linen pulp, and this is more difficult than at first appears. All porons or capillary bodies have the power of holding with great mechanical force gaseous bodies in contact with their surfaces. Many kinds of paper pass into the market from which the chlorine has not been entirely removed, and if any of the photographic processes are carried on upon such paper, or even if used for water-colours, it becomes apparent by the chemical action which is set up. In some cases the hyposulphites of lime and soda are employed as bleaching agents, and also the sulphites and sulphurous acid. Papers so bleached very commonly retain traces of sulphur, and blacken any of the salts of silver spread upon them. The object in view is to produce absolute whiteness in the fibre employed: any of those chemical bodies will effect this; but great care is required in the subsequent washing processes to cleanse the pulp thoroughly. This washing free from the chlorine gas is effected in the washing-engine already described. From this the rags are passed into the *beating-engine*, which nearly resembles the washer, but that the knives on the roller and plate are put much closer together, and that the roller is moved with much greater rapidity. Having been subjected to this action for several hours in this machine, the rags assume a beautiful pulpy appearance, like thick milk or cream, and it should be perfectly free of colour.

For many of the common varieties of paper the *size* is now added. The size is some gelatinous matter, usually prepared from sheepskins, or the refuse pieces of the tan-yard. For the finer kinds of writing paper the size is applied after the sheet is made.

From the beating-engine the paper pulp is conveyed to a large circular vessel, which contains several engines; this is technically called *stuff*. This is kept uniformly suspended by means of an agitator, which constantly revolves in the vessel. From this vessel a stream of this fine paper pulp is constantly flowing through a cock into the *vat*, which is thus

always maintained at a uniform height. A portion of the pulp now flows upon a wire frame, which, being connected with a crank movement of the engine in large manufactories, is constantly shaken; this wire frame is called a *sifter*. Having passed through the sifter, the pulp flows still onward to a ledge, over which it falls in a regular stream, like a sheet of water over a smooth dam. Here the pulp passes upon a plane surface of five or six feet in length, upon which it spreads out as a very uniform sheet. This plane surface is constantly moving onward, and uniformly shaken; it is, indeed, an endless web of the finest wire gauze.

The pulp as it passes on, by the motion of the web, becomes more and more solid, but it still retains much moisture and remains soft. Before the paper passes off from this web of wire, it moves under a wire cylinder which presses upon its surface, and now leaves a succession of lines on the paper, marking its passage; it then passes under another cylinder, which is clothed with felt, and kept constantly moist by a stream of cold water. A tightly-stretched surface of flannel advances towards the plane of wire, and receives the sheet. It passes gradually over the flannel, and this absorbs much of the moisture which still remains; two rollers now seize it, and the paper is powerfully squeezed between them. It passes over another plane of endless flannel, and then through another pair of rollers. From the last pair of pressing-rollers the paper is received upon a small roller, which guides it to a large heated cylinder; from this it passes on to another yet hotter, and having a finely-polished surface. From a third cylinder, upon which it is subjected to the pressure of a blanket, the paper passes to the fourth and last heated cylinder, upon which it is perfectly dried, and from this it is handed to the *reel* as finished paper.

It will be evident that the process, from the vessel full of pulp into the formation of a complete sheet of paper, is perfectly continuous. From the commencement, when the pulp flows out of the vat upon the web of the wire, till the paper into which it is formed is received upon the reel, somewhat less than two minutes of time is occupied. A supplementary machine receives the paper from the reel, and as it mounts upon the drum, a circular knife cuts it into two breadths, while a series of sharp teeth which strike against it within, divides it, by a stroke of invariable regularity, into the requisite length.

The sheets of paper, completely formed, are taken from the machine-room and subjected to a very careful examination. This is usually performed by young women, who remove every knot or speck in each sheet, and reject those sheets which are seriously defective. These sheets are next subjected, in their full size, to a powerful hydrostatic press, and the edges are cut by the action of a knife called a *plough*. The open sheets are now counted into quires of twenty-four sheets, folded, and packed in reams of twenty quires.

Hand-made paper is regarded as being in many respects superior to that made by the machine. The only real difference is that the frames are covered with the pulp and shaken by the workman, who has thus an opportunity of examining each sheet in its progress. When paper is made without size, it is necessarily very absorbent—such is our ordinary blotting-paper. To such paper the size is now applied—gelatine, starch, and resin are severally employed by different manufacturers; the most celebrated of the French paper-makers employing starch for their finer varieties of paper.

Writing papers of fine surface are now sold at very low prices. Many of these kinds will be found to absorb the ink very rapidly notwithstanding the hard polished surface which gives the paper its fine appearance. Into the

pulp of such paper large quantities of the white China clay are introduced, and thus weight and body are obtained at the sacrifice of durability; such paper must fail completely in a few years. Many of the ordinary demy papers, which are used for printing upon, have in the same way body and weight given to them by China clay, or lime. This cannot be regarded in any other light than a fraud: it is true that the manufacturer has been led on to this practice by the demand for cheap paper, and the increasing cost of the vegetable fibre which is employed in the manufacture.

Every person will be familiar with the rice-paper of the Chinese, and with an Indian paper which is very full of straw in fine particles—indeed, some of our own commoner papers exhibit a similar character. These varieties of paper are named solely to lead to the explanation that the barks of the lime-tree, the hawthorn, the aspen, the beech, and the willow may be—indeed, have been—used to make paper. The tendrils of the vine, the bines of the hops, the stalks of the nettles, the mallow, and the thistle make tolerably good paper, and several patents have been taken out for the manufacture of paper from straw. Any fibrous substance, indeed, may be employed for this purpose.

The coarsest materials, since the improved bleaching processes have been introduced, are, however, now employed in the manufacture of paper. Cordage, coarse canvas, and similar substances can now be used.

In the manufacture of the fine varieties of drawing-paper, extra care is of course taken to ensure uniformity of composition and excellence of colour. This is especially the case in the paper prepared for receiving fine engravings, and such as is used for water-colour painting.

In connection with the manufacture of such papers there exists, however, a very serious defect, demanding a close and careful examination. We have lately seen some of the finest impressions of Landseer's pictures which are completely destroyed by the appearance of yellow spots upon every part of the sheet. One of the finest large paper copies of Audubon's "Birds," to which attention was lately called, was found to be spotted in this way over every part—in many of the plates the beautiful colours giving way before those gradually increasing spots. This condition appears to be more readily brought about in a humid climate, or under the influence of a saline atmosphere—as near the sea—than in the midland counties of England; but even in the metropolis this diseased condition very frequently manifests itself.

We are disposed to believe these spots to be the result, in the first place, of a decay—a perfect decomposition of the size employed—which furnished the soil, as it were, for the growth of some of the microscopic fungi. The disease is often generated at the copper-plate engraver's, before the print passes into the hands of the public, by allowing the sheets damped for printing to lie together for some time. We have seen a parcel of engravings through the whole of which the spots have generated with curious uniformity.

In many instances it would appear that gelatine has been employed as a size, when it has already become somewhat putrescent. The chemical change rapidly goes on after its application to the paper, and thus, through want of care on the part of the paper-maker or of the copper-plate printer, the purchaser of expensive prints and of illustrated books is exposed to the annoyance of seeing the objects of his admiration, obtained at much cost, gradually but certainly perishing.

The remedy for this is the use of perfectly pure materials, and a process for consolidating the gelatine, or the size employed, so that it may resist the action of moisture. When the

spots are forming they may be checked by passing an iron, which is not quite hot enough to scorch the paper, over the face of the print. If the sheets are separate, and the stains are very bad, we can, if there is no colour liable to receive injury, sponge the print with a solution of the bichlorate of potash, and then dry it off with a hot iron.

When we remember the value which we attach to the books of antiquity—when we are daily reminded of the importance of possessing editions of books which have been subjected to the revision of the author himself, the importance of manufacturing, for printing purposes, paper of the finest quality, consisting entirely of vegetable fibre, and in which a *size* of the best character has been used, cannot be too strongly urged.

The great error of our age is that we are satisfied too easily with appearances—anything looking good is received without examination; and provided the *seeming good* can be obtained cheaply, we care but little about the final result. In the article paper, equally with everything else, this holds true. Let us hope that, since attention has been directed to the sad defects of adulteration and of carelessness, an improved condition of things will arise.

R. HUNT.

ART IN THE PROVINCES.

MANCHESTER MECHANICS' INSTITUTION.—We have but a limited report this month to make of the progress of the Mechanics' Institution; the catalogue of pictures is not yet "ready," or was not in time for us to avail ourselves of its information. There have been, however, numerous additions—hence, we imagine, the cause of the delay. The Art-industry collection has also been considerably augmented; and we believe the exhibition may now be described as complete. We shall probably be enabled to give further details in our next number. Meanwhile, we understand, the people of Manchester have responded to the call thus made upon them: so it ought to be; for the gathering together of so many rare Art-treasures was a serious labour, but one which could not fail to be extensively useful.

The "Free-trade Hall" of Manchester has been opened; it is a structure of exceeding beauty, admirably adapted to the purposes in view, and confers high honour on the architect. We hope to describe it hereafter.

It is proposed to have an exhibition of the works of artists born or resident in this locality, to inaugurate the new wing of the Museum, Peel Park, Salford: a meeting was held on September 18th in furtherance of this object, at which many influential gentlemen and artists, connected with Manchester and its district, were present. Resolutions to carry out the project were unanimously passed, and Mr. Hammersley, the head-master of the Manchester School of Art, was elected chairman of the committee. The exhibition will probably open on the first Monday in March of next year. Artists are to be at the expense of forwarding the pictures they intend to exhibit, the committee undertaking to insure the works, and to return them free of cost. Pictures by deceased artists will be eligible for admission; these will be collected at the expense of the committee.

BIRMINGHAM.—The Exhibition of the "Birmingham Society of Artists" opened in September last. We have had no opportunity of visiting it, but the local papers speak of it as containing 450 pictures, a large majority of which are landscapes; the portraits are fewer than ordinary. The contributions of metropolitan artists are neither numerous nor of the highest order; the pictures by local artists are considered a decided improvement upon those in former exhibitions.

GLASGOW.—The paragraph we published last month respecting the projected glass-painting for the windows in Glasgow Cathedral appears to have been in some respects incorrect, although we procured our information from what was considered a reliable source, and a similar statement was published both in the London and the Glasgow papers. We are requested to say, that the Lord-Provost of Glasgow entirely disclaims the unauthorised use which has been made of his name, so far as regards his application to Mr. James Ballantine for designs for the windows. At the close of the last meeting of the Committee appointed to report generally

upon the style, subjects, and the best method of securing good artists to execute the windows, the Lord-Provost stated that "his name had been thus used without his sanction, by parties writing to the newspapers, and putting forward their particular views and wishes for employment. He desired to take this public opportunity of stating that this had been done, not only without his sanction, but in the face of his express desire to the contrary. He felt certain that it was the unanimous feeling of the subscribers to keep the field open: it was open—and he trusted that it would be kept so, till the subscribers had time to make up their minds how to secure a first-rate series of windows—works of Fine-Art, and worthy of the cathedral and of this great city."

CHELLENHAM.—Mr. H. R. TWINING exhibited at the recent meeting of the British Association at Cheltenham, a series of models to illustrate a new method of teaching perspective. The object of his communication was to explain the principles of perspective in such a manner as might enable those who draw to distribute their objects, not only in a correct manner, but in one agreeable to the eye. It is an intermediary step between those rules which are demonstrated by diagrams in the usual treatises, and those appearances which characterise natural objects themselves. The chief difficulty in enabling an audience to follow out the principles of perspective, when applied to solid objects, is that every individual sees them from a different position, so that such an explanation of the effect observed, as is adapted to one individual, cannot suit another. Mr. Twining's method aims at overcoming this difficulty, by placing a bust or image (with which each individual is supposed to identify himself) in the exact spot which the observer ought to occupy, and which thus serves to mark the true focus of the picture.

CLONMEL.—A conversation of the friends and supporters of the Clonmel Mechanics' Institute has been held for the purpose of witnessing the distribution of the Osborne prizes to students of the school in the Mechanics' Institute, and which is under the management of its committee. At the opening of the school, in November, 1854, the inaugural address was delivered by Ralph Osborne, Esq., M.P., to the effect of which on the community the present prosperity of the school is in an eminent degree to be attributed. The prizes in question were purchased with a sum of £20, which Mr. Osborne placed at the disposal of the committee for that purpose the first year, but in consequence of the absence of merit in the students, who had all commenced the study of Art at the opening of the school, the award of prizes was deferred till the present season. The report of the examiners, Messrs. George J. Gould, R.M., and Thomas Scully, M.D., was highly complimentary to the master of the school, Mr. J. Healy, for the marked progress in the students' works, and it also commended the care and attention of the pupils. We learn that the names of Messrs. Robert Malcomson, Joseph White, and John Bagwell, Esqs. (all local gentlemen), have been put down for the sum of £20 each for the same purpose during the next three years.

YARMOUTH.—Have the gentlemen of the county of Norfolk, to say nothing of the gentlemen of England, lost all recollection of the deeds of their heroic Nelson, that they permit the monument erected at Yarmouth to fall into absolute ruin? Such, we understand, is the fate to which it is destined, and which it seems would long since have befallen it, had not the old Trafalgar seaman, James Sharman, who "shows" the monument, expended no small amount of his earnings in keeping it in some kind of repair. How much of national disgrace, but of individual honour, is recorded in this fact! Sharman, says the *Bury Post*, would not ask the country for a farthing towards preserving the memorial, were it not that his income from exhibiting it has been lately so reduced that the receipts have not sufficed for the maintenance of him and his family: he was one of the sailors who carried the dying Nelson into the cockpit, after he had received his fatal wound. In this age of statues and testimonials, cannot a hundred or two pounds be collected to repair the Yarmouth Monument?

YORK.—Mr. J. C. Swallow, head-master of the York School of Art, delivered, on the evening of September 24th, a lecture, principally to the working classes, on drawing and painting. We may remark, to the credit of Mr. Swallow, and to show his desire to inculcate a knowledge of Art among mechanics and artisans, that he has established a class gratuitously for their benefit, in the hope that when they have learned the elements of drawing they may afterwards be induced to enter the regular classes, on payment of the usual fees. Such an act is worthy of being made known and imitated.

GOG AND MAGOG.

GUILDHALL AND ITS MONUMENTS.

LET not Gog and Magog be considered as foreign to Art. Are they not coloured sculpture? Endued, too, with a vividness and variety of tint sufficient to satisfy the most polychromatic of the polychromatic school! May it not even be held as strange that in the vexed question of coloured sculpture they should never have been brought into court? Are they not at least as successful as the coloured Parthenaic frieze in the Crystal Palace? Perhaps some dreadful people may be found who think them more so—inasmuch as colours may be held to be in better accord with their grotesque art than with the purer images of the Greeks! But let that rest. We have a great respect for these time-honoured warders of Guildhall—not only for their art, which, in their grotesque way, is good, but as representatives of the city of London, which has of late been doing more for the Art of Sculpture (to which we suppose the giants hold themselves to belong) than any other institution, body, or locality. Sixteen marble statues (of poetic subjects, too—hear this, O West End!) have been voted by the Corporation for the Egyptian Hall, in the Mansion House, at the cost of £11,200, of which twelve are either executed or in hand. Also the Wellington Memorial, in the Guildhall, the whole expense of which, including the prizes given away in the competition, will not, we suppose, be under £6000, and an admirable bust of the Queen (by Durham), for the Council Chamber, presented by Alderman Sir Francis Graham Moon, Bart.—and all this within three years! The east side of Temple Bar is setting an example which we should be glad to see the west follow. *Apropos* of this, the other day the Office of Works, before they sent forth their own specifications for the Government tribute to the Great Duke, to be erected in St. Paul's, applied to the Corporation of London to know the steps they had taken in conducting their "Wellington Competition." Is not that a feather for the caps of Gog and Magog?

But to return to these personages. Their early history, like that of other half or whole divinities, is somewhat shrouded in obscurity. Hatfield, in his new view of London, which bears the date 1708, speaking of Guildhall, says:—"This stately hall being much damaged by the unhappy conflagration" (the Great Fire of London) "in 1666, was rebuilt anno 1669, and extremely well beautified and repaired, both inside and out, which cost about £2500, and adorned with two new images of gigantic magnitude, as before." They next appear in history on the 24th day of April, 1685, as taking part in "an high entertainment of wonderful and stupendous fireworks, in honour of the coronation of James II. and his queen, being placed on a raft on the river opposite Whitehall, in front of a huge pyramid of fireworks, the display of which lasted an hour." This seems to witness to the honour in which they were held at this time, inasmuch as so great an occasion was not considered complete without their presence. Such regard, however, appears not to have been universal, or, at any rate not lasting, for their next mention in print is not of the same character. This occurs (we quote from Hone's "Mysteries") fourteen years after the above date, in Ned Ward's "London Spy," published in 1699, in which we are grieved to say the Giants are not treated with becoming respect; but we insert the passage, were it only to show what Goths there were in those days! Describing a visit to Guildhall, he says:—"We turned down King Street, and came to the place intended, which we entered with as great

astonishment to see the Giants as the Morocco ambassador did London when he saw the snow fall. I asked my friend the meaning and design of setting up these two lubberly preposterous figures?"—"(*Procul este profani!*," we exclaim)—"for he supposed," he continues, "they had some peculiar end in it. 'Truly,' says my friend, 'I am wholly ignorant of what is intended by them, unless it were to show what great boobies their forefathers were, or to fright stubborn apprentices into obedience to their masters, for fear of having to appear before them, and my Lord Mayor, and the Chamberlain of London—for some are as much in awe of Gog and Magog as little children at the terrible sound of Rawhead and Bloodybones.'" It was on this account, no doubt, that we are told that "by Gog and Magog" was a favourite city oath in those days. In later times even, it was a hallowed city myth that they always came down when the clock struck noon, to eat their dinners, as behoved city magnates; and it is only since their last removal from their then position in the hall to one less prominent, which took place in 1815, that taking it in dudgeon, they have refused to eat their meals, or the story has lost credence. Further, William Hone, *loquitur*:—"Until the last reparation (speaking of the hall), the present Giants stood with the old clock, and a balcony of iron-work between them, over the stairs leading from the hall to the courts of law and the Council Chamber. When they were taken down in that year, and placed on the floor of the hall, I thoroughly examined them. They are of wood, and hollow within, and from the method of joining and gluing the interior, are evidently of late construction, but are too substantially built for the purpose of being either carried or drawn in a pageant."

But we have gone on a great deal too fast. The present Giants, as we have seen, and of which Hone speaks as having stood at the west end of Guildhall, on each side the window, are not the original Simon Pures—far from it. It appears, indeed, that "Giants" partake of the nature of the Phoenix, and are periodically reproduced from their ashes. Thus the "giants" of Ned Ward are not the giants of William Hone. It appears that the artist of the present images was a certain Captain Richard Saunders, who dwelt in King Street, Cheapside, and was an eminent carver; and farther, that they were set up in Guildhall, about the year 1708, in the room of the two old wickerwork giants, which had formerly been carried in processions, and which, it is believed (we quote Mr. Josiah Temple), were first used at the restoration of Charles II., when they graced a triumphal arch erected on that occasion at the end of King Street. We must not, however, pass over a rare old book entitled "The Gigantic History of the Two Famous Giants in Guildhall," that goes back a vast deal farther than this. It affirms that Gog and Magog are *corrupted names*, and that their original titles were *Corinaeus* and *Gogmagog*, who were both brave giants in the good old days of King Arthur; that they were great in virtue and honour as well as inches (the giants are each fourteen feet high). They were also loyal good citizens, and deeply attached to the "vested rights of their town;" and their images thus appropriately came to be placed in Guildhall, as representatives of sturdy civic valour and magnanimity. Somehow or other, it appears that the name "Corinaeus" slipped out of the category altogether, as savouring too much, perhaps, of Roman domination; and that of Gogmagog, being thought long enough for two, was accordingly split with an uneven stroke, and *ecce* Gog and Magog. It may be as well, however, here to emphasise that both are representatives of *gentlemen*, for it has been held that one is a *lady*. This is a vulgar error. Were it not so, however, and were they really

man and wife, as some visitors have supposed, it might not be difficult to continue the family tree, inasmuch as in the late alterations in Guildhall, in excavations for the new law courts, and turning the crypt into a kitchen, a wooden image has been found of questionable parentage, which might be well fathered and mothered upon the giants in question. The "babby," in that case, would no doubt become an object of especial and legitimate interest in the city.

But, to return: the expression, "there were giants in those days," gives us a great idea of the antiquity of "those days"—perhaps the greatest possible. Therefore it cannot be expected that we can fix the date when Gog and Magog first appeared on the civic scene. It must have been, indeed, a long time ago—for does not every one look upon them as part of the "institutions of our great metropolis?" For ourselves, we confess we look upon them as another "palladium," obnoxious to ruthless reformers, who will have, some dark night, perhaps in the small hours after a civic feast, surreptitiously to steal them away, or they will never take the City! As regards, however, images in general, gigantic or otherwise (removable, of course, too, as these were of old), it is evident that they formed important features in the earliest pagancies and solemn shows of our forefathers. In 1599, Henry Hardman, a mayor of that year, from religious motives caused "the giants" in the midsummer's show to be broken, and the representation of the "Devil in his feathers" to be done away with! (In this is evident the evils that even giants may suffer from getting into bad company): and instead, he provided a "man in complete armour" as less objectionable. That the institution of giants was, however, in some degree, even at that iconoclastic time, fostered and respected, is evident from an account extant of charges for the Chester pageant, for arsenic to put in the paste requisite in the construction of these images, so as to save the giants from the rats! Long may they live—that is, not the rats, but the giants—and if they may not quite agree in character with their marble brethren in the same apartment, at any rate they may claim the right of first possession. "First come, first served," is an adage they might appeal to, which, however, does not appear to have great force in the hall at present. For the monument to Alderman Beckford is for a second time removed. We have seen an engraving representing him as he formerly stood, in the centre at the west end of the hall. Of late years he has bowed a welcome to all as a pendant to the Nelson Memorial, and now he has just again blandly shifted his quarters to make way for the "Iron Duke." For this, however, the judgment of the Corporation will "mould no feather." Though Nelson ended his career at Trafalgar before the commencement of Wellington's successes in the Peninsula, yet history will ever look upon them as brother heroes, who in their different services, during the same war, repelled the tide of iniquitous aggression. The City have availed themselves of this parallelism, and emphasised it into an Art fact as well as an historic fact. This association of these heroes will combine these two central sculptural decorations of their hall into a kind of united service memorial, aesthetically true as regards the period and characteristics of the two men. And where else has this been done? Trafalgar Square should, as we have often before said, have had two monuments, one to Nelson and one to Wellington—one on either side, where the two fountains now are, and no pillar in the centre to block up the centre approach: but it can't be done now. In St. Paul's also, where the mortal remains of the two heroes lie, the memorials will not pair. If this parallelism is a

valuable feature for Art as well as history, why then all honour to the Corporation, and may they go on and prosper in their views of Art-encouragement.

But now we have something to say about the hall itself. It is a Gothic edifice with a Greek roof. We are not at all prepared to praise *this*. The roof, however, is fortunately *temporary*, and it is quite time for its *tempus* to end. We know that the architectural movements in the locality are regulated by a mind of great taste, and of a liberality that will excuse our suggesting that the appearance of the great festive hall of London would be vastly improved by a light from above by means of a Gothic roof (perhaps of iron and glass, but we won't commit ourselves to this), and an encaustic tile pavement of bold pattern and solid colours. The fact is, the hall wants a better light, and it wants colour. The latter not all over like the interior of St. Denis or La Sainte Chapelle, but here and there on the walls, and especially in the floor; the very stones of which, broken and uneven as they are, cry out for redress, or rather, we would say, for removal. The length of the hall is 153 feet, the breadth 50, and the height 55.

As it may be of interest to some of our readers, we subjoin some particulars, of cost especially, connected with the memorials to distinguished personages that decorate the hall. The expense of erecting that to the Earl of Chatham, by Bacon, in 1782, was £3421 4s. The inscription was by Burke. That to the great earl's great son, William Pitt, by Bubb, in 1813, cost the City £4078 17s. 3d. The inscription is by Canning. That to Beckford, which has just been removed to the arch to the west of that occupied by the Nelson cenotaph, was executed by Moore in 1770; but there is no record of its cost. The sole inscription on this is a speech to royalty, once made by this worthy alderman in the good old days of George III., which, we fear, would make Mr. Thackeray place him among his "snobs." The last on the list of memorials is the tribute to Admiral Lord Nelson, which was completed in 1810 by Mr. James Smith, at the cost of £4442. The inscription is by Sheridan. It is to be regretted in this memorial that it contains no portrait of Nelson, except a medallion—held, too, by Britannia, with the jealousy of true affection, in such a position that no one can see it but herself! A memorial thus treated rather suggests "Hamlet without the prince;" but with this exception it must be held to be satisfactory, as it possesses all the legitimate adjuncts of such naval tributes—for instance, Britannia, also her lion, and Neptune, and a figure engraving the achievements of the hero on his tomb.

The cost of these memorials strike us as small compared to parallel works in other situations; as, for instance, for that to Rodney in St. Paul's, which is not larger than the smallest we have enumerated, £6000 was paid to Rossi, R.A. Against this, however, we may place the sum paid to the late Sir F. Chantrey by the Corporation for the single statue of King George III., in the Council Chamber, in Guildhall, which we find recorded as having been £3089 5s. These discrepancies in price suggest that advantage might arise from some more definite rule prevailing in this respect. Certainly, as it is, some works of sculpture are paid too much for, or some too little. The results are, in neither case, advantageous to Art. Might not this afford a subject for consideration by our Institute of British Sculptors?

The City of London, as we remarked in the beginning of this article, is setting an example of liberal and judicious expenditure upon the art of sculpture, which we trust will not be lost either on the Government or on the wealthy provincial corporations which have the means of "doing likewise."

SUNSHINE.

FROM THE STATUE BY J. DURHAM.

FLAXMAN, in his sixth lecture, observes, "The sculptor must not forget that his art is limited, in comparison with painting; colours and their effects are beyond his bounds; whether the act he represents was performed in the bright mid-day sunshine, or the darkness of midnight, concerns him not—his forms must be equally perfect. Even in bas-relief, a tree or two, some rude stone, or a wall slightly marked in the background, must indicate a forest, a mountain, or a palace, without detailing a portrait of their component parts." With such restricted powers, as regards design or composition, a work of sculpture that offers to us an original idea must ever invite attention and command respect, even when the execution or carrying out of the idea might probably scarcely justify it. Originality in Art evidences thought, study, independence, and self-reliance; he who seeks it looks away from the past, and onward into some unknown region of fancy, where thought has not hitherto penetrated, nor Imagination as yet found a resting-place.

In his search after originality, however, the sculptor must be careful that he does not step beyond the legitimate bounds of his own art into the domains of the art of another—as that of the painter, for example; for the conditions of all imitative laws are so true and definable that they cannot be encroached upon or interrupted without danger to him who makes the attempt. "Though sculpture cannot steal from painting the natural colour of objects, it does, nevertheless, too frequently pretend to dispute with it those kinds of subjects which owe their true value to the effect of colouring and aerial perspective; and the art of the sculptor has been seen to attempt in stone the production of skies, distances, and landscapes. In like manner the painter will be found treating subjects that narrative alone can give a value to, or render intelligible; and the dramatic poet making excursions into the territory of the historian, or the epic poet, &c. . . . Art owes the only superiority its images can possess over reality to their keeping within the bounds of their particular nature; for the happiest results of imitation depend on a faithful adherence to its elementary principle. . . . It is for want of an adequate knowledge of the means or conditions of imitation considered as to the end to be kept in view—it is for want of comprehending the conventions on which the ideal depends, and the force of their consequences, that the artist often commits in his works the most outrageous inconsistencies; so that while we see one looking forward to the right end without following the proper track, we see another entering on the proper track without thinking of the end to which it leads."

Our first impression when looking at Mr. Durham's statue of "Sunshine" was, that the subject is not within the proper limits of sculpture, inasmuch as the idea is not complete in itself; it seemed, on a primary consideration, to require what the art can by no possibility give to render the idea perfect: a little thought, however, was sufficient to satisfy us that our first impression was erroneous. The proper attributes of sculpture are sentiment, or action, allied with beauty of form, and here the last two qualities are united; the light or sunshine, which alone is required to make the idea perfect, is supplied, inferentially, by the action. It follows that such a statue should always be placed where the light would fall upon it according to the laws of nature: it should be neither in the corner nor the centre of a room, unless the windows be so arranged that the rays of light fall down upon the figure.

The figure—that of a young girl—is very gracefully and correctly modelled; the attitude is unconstrained and perfectly natural; the sharpness of the shaded part of the right arm, which seems to cause the limb to lose something of its rotundity, is occasioned by the strong light which falls upon the arm in the room where it stood when the drawing was made. It is of small size, and executed in marble; has not yet been exhibited, and therefore, we presume, is still the property of the sculptor: but Mr. Durham proposes to send it to the forthcoming "Art-Treasure Exhibition" in Manchester, where there can be little doubt it will not long remain unsold.

* De Quincey on "Imitation in the Fine Arts."

SUNSHINE

ENGRAVED BY W. ROFFE, FROM THE STATUE BY J. DURHAM

THE WELLINGTON MONUMENT,
IN GUILDHALL.

THE Wellington Monument is now in its place in Guildhall, on the right of the doorway leading to the city offices, and forming a pendant to the Nelson Monument on the other side of that entrance. At the time of our visit the work was seen under the greatest disadvantage, being then, as yet, almost screened by the scaffolding; certain of the details of the erection not having been accomplished: it will not be inaugurated till after the 9th of November. In consequence of the preparations necessary for the usual civic festival on that day, the sculptor has been compelled to suspend his operations for three or four weeks. In comparison with Bacon's monument to Pitt, and that already mentioned to Nelson by Smith, the new monument reads most impressively. Moreover, Mr. Bell's composition consists principally of a portrait statue—incomparably the most valuable object in every monumental creation, and the more valuable in inverse proportion to the quantity of allegorical accessory. In Bacon's work, Pitt is the least significant of the figures—the beehive, even, is more prominent; the composition is full of commonplace, and hence the poetry does not rise above a vulgar strain. In the Nelson Monument the *persona* are not so numerous, the style of the narrative is more solemn; but Nelson himself is not there—an omission which gives to the monument a sepulchral rather than a biographical and commemorative character, which we submit should be that of all honorary memorials. Britannia and Neptune are mourning the death of the hero, and History has just concluded a record of his achievements on the tablet behind; but he whom it most concerns is absent. The Wellington Memorial is as simple as an allegorical composition can well be, presenting a portrait of the Duke, not as a Greek hero, nor in a Roman drapery, but as he was known and is remembered, wearing, as well as the scaffolding permitted the statue to be seen, a plain frock coat. The monument, which is of great weight, is supported by a brick-built pedestal, describing in its projection from the wall the arc of a circle, which is being faced with marble. The only inscriptions above and below the composition are the three words, "Wisdom," "Duty," "Honour," at the base, and above the statue the far-famed title "Wellington." On one side of the statue is Peace, and on the other War, in allusion to the Duke's having passed one half of his career in arms, and the other half as a statesman. Between these figures the hero stands holding in his left hand a marshal's baton, and in his right a copy of the articles of the peace of 1815. The same feeling is observed on the pedestal, as, below Peace, there is an ornamental shield presenting a dove with an olive branch, and inscribed, "*Pacis imponere morem*," from the ultimate charge of Anchises to Æneas, in the sixth book of the *Æneid*. Beneath the figure of War is a shield bearing the Wellington crest and motto—a lion's head with the words, "*Virtutis fortuna comes*," and between these is a relief illustrating the most critical period of the battle of Waterloo. The age at which the Duke is represented, is between fifty and sixty, some years after the close of his brilliant military career, but yet in the prime of life. The figures have all been modelled to the same scale—that is, a stature of eight feet six inches, and the weight of each figure is about five tons, and seldom have we seen so much marble constituting one monument turn out so well. As far as could be well effected, it forms a pendant to the Nelson memorial on the other side of the doorway; the two works rise from similar bases, and a pediment is placed behind each in the arch. The cost of the work is £5000, and it has been executed and erected in a period a little over two years—a very short space for a work of such dimensions. These three monuments illustrate three remarkable transitional periods in the history of our school of sculpture. Bacon's monument is conceived in the full licence of allegory; Smith's shows its decadence, but is more sepulchrally monumental than the majority of those in St. Paul's and Westminster Abbey. We are now arrived at the historical period of public monuments, in which a portrait statue of the personage commemorated is indispensable as the principal in the composition.

OBITUARY.

DR. EMILE BRAUN.

The continental papers mention the death of this distinguished antiquarian, at his residence on Monte Caprino, Rome. Dr. Braun was secretary of the Archaeological Society of Rome, and is well known to antiquarians by his published lectures on Roman antiquities, and by his "Handbook" on the same subject. He contributed to the *Art-Journal*, in 1850, some papers on "Electrotyping applied to Art-manufactures;" and a little pamphlet, of which he was author, on "Classical Iconography," was referred to by us in the preceding year, in our notice of the meeting at Birmingham of the "British Association." The model of the Coliseum in the Crystal Palace at Sydenham was made under his directions. Dr. Braun's acquirements were not limited to a thorough knowledge of antiquities: he was learned in many of the sciences; and his death, at a comparatively early age, must be greatly deplored in the scientific world.

MR. JOSEPH POWELL.

Among the recent deaths among artists to which we are called upon to direct attention, we have to announce that of Mr. Joseph Powell; he died young—his age was about twenty-two, but he had given large promise of future fame, and had already gained the best honours of his profession. To him was awarded two silver medals of the Royal Academy, in 1854, and the gold medal in 1855. There can be no doubt of his great success had his life been prolonged. When referring to his "honours" in 1856, but a few short months ago, we thus observed:—"With our congratulations we shall also offer a word of advice: he must remember he has only just entered upon the path which leads to fame; he has an arduous journey before him; and if he desire to reach the end of it honourably, and to secure himself a lasting reputation, he must be 'up and doing, laboriously, studiously, and perseveringly.'"

Unhappily, Mr. Powell was not one of those who united prudence to genius—his habits were undoubtedly those which impair intellect and shorten life. With the best prospects, he sought to enjoy the present and not the future—his youth was squandered, and the world has sustained a loss which it has doubly to deplore. There is a lesson in the career of those who fail scarcely less impressive than in that of those who succeed in life, while the one is far more solemn than the other. The cases are few in which men cannot walk in the path they have deliberately chosen; very often failures are things that need not be. Mr. Powell was certainly the author of his own destiny; he had many advantages of which he declined to avail himself. It was our task more than once (during our intercourse with him, and while employing him to make drawings of several of the statues engraved in the *Art-Journal*) to reason with him concerning the wisdom of husbanding the resources of life; he was, to adopt an emphatic, but commonplace figure, burning the "candle at both ends," misapplying his powers, and wasting his energies, and exhausting his constitution; and it is our sad and painful duty, in recording his death, to warn young men of genius as we did him—we hope not always in vain!

MR. THOMAS HOPPER.

The name of this gentleman, an architect of high reputation, appears among the "deaths" lately announced in the public journals. Mr. Hopper's life was one of unusual length—he had nearly reached his seventy-ninth year—and of remarkable activity. Our contemporary, the *Builder*, gives the following list as some of the edifices erected from his designs and under his superintendence:—the Conservatory, and other works at Carlton House, for George IV. when Prince Regent; Slane Castle, Ireland, for the Marquis of Conyngham; Penryn Castle, Bageor; Margam, in South Wales, "a noble mansion in the enriched Tudor style;" Dunkeld, Scotland, for the late Duke of Atholl; Leigh Court, near Bristol, for the late Mr. Miles; Llanover Court, Monmouthshire, for Sir Benjamin Hall; Gasford Castle, Armagh; Arthur's Club House, St. James's Street;

the Atlas Fire Office, Cheapside; and the Legal and General Life Office, Fleet Street. Mr. Hopper was a competitor for the General Post-Office, and he subsequently published his designs, as he did also his plans for the New Houses of Parliament. "On the whole," concludes the writer, "we cannot but feel that, by his death, a man of mark and power has been taken from among us."

MR. WILLIAM YARRELL.

Although not strictly within the limits of our necrology, we ought not to allow the death, on the 31st of August, of "the good old British sportsman and naturalist," William Yarrell, to pass without a line or two of notice. In the early part of his life an enthusiastic angler and a keen sportsman, he brought, in after years, the knowledge he had acquired in these pursuits into the world of literature; his "British Birds," and "British Fishes," are valuable contributions to the science of natural history: while the illustrations that ornament the pages of these books, chiefly we believe from his own pencil, are among the most beautiful examples of their kind to be found in any volume. His contributions of papers to the Linnæan Society, the Royal Society, and others, evidence the large amount of information he was possessed of as a naturalist. He died suddenly, while on a trip to Yarmouth by sea, and at the age of seventy-two.

THE
ART-TREASURES' EXHIBITION
AT MANCHESTER.

We have little to report on this interesting subject—except that matters are progressing in a manner entirely satisfactory. The committee are labouring with industry and energy; the several *employés* are actively working; the building is gradually moving towards completion; and, especially, the possessors of works of Art throughout the kingdom are, with scarcely an exception, according to the project their cordial support. The list of noblemen and gentlemen who have arranged to contribute pictures is now so long, that to print it would be to occupy more space than we can afford: it will suffice to say, that the liberal example of Her Majesty and the Prince has been followed by the best of her subjects.

There is consequently a certainty that the collection of Art-treasures, in pictures, will be the most extensive and valuable that has ever been, or perhaps ever will be, gathered in any one building. To see this wonderful sight, the Art-lovers of all parts of the world will no doubt visit Manchester; and we trust the summer of 1857 will be as auspicious to Art as was the summer of 1851. We have now the hope of seeing realised the truth of a statement we made two years ago, in reviewing Dr. Waagen's "Art-Treasures in Great Britain," that "if we could gather into one focus the heaps of Art-treasures which are scattered through the broad face of our country . . . if the noble would strip his ancestral halls, the princely merchant his palace, and the wealthy manufacturer his home of luxurious enjoyment, we might challenge any country to produce an exhibition surpassing this—nay, even to equal it."

As our readers know, pictures will not be the only Art-treasures here collected: every conceivable class of Art will be represented—not only from stores in England, but from those of the Continent.

With respect to Art-manufacture—that is to say, the Art-manufacture of the present time—we are not yet in a condition to supply our readers with sufficient information, or to reply to the many communications we have received on this important branch of the subject. We shall be better able to write concerning it in a month or two, when the arrangements of the committee are further advanced.

It is not intended to make the exhibition an exhibition of manufactured works; but such as are of special merit will not be excluded because they are modern: on the contrary, they will be desired and asked for, although the issue of letters applying for contributions of that class are necessarily postponed for a time.

The Exhibition of Art-treasures at Manchester, then, so progresses as to remove all doubts of its entire success.

MINOR TOPICS OF THE MONTH.

MR. E. M. WARD, R.A., has been honoured by another commission from the Queen for a picture; the former, as was announced some time since, being the Investiture of the Emperor of the French with the Order of the Garter; here we shall see the pomp and glitter of sovereigns and nobles arrayed to pay honour to the living. The subject selected by Her Majesty for the new picture is of a very different character—the visit of the Queen to the Tomb of Napoleon, during her short sojourn in Paris, last year. This remarkable historical incident will, no doubt, make a most interesting picture, but it will prove a difficult subject to treat, arising from the peculiarity of circumstance no less than from the diverse materials, of personages and costumes, which must, of necessity, be included in the composition: there will be again the pageantry of regal state, yet not, as in the other, shining in the blaze of day, but enshroued in the shadows of the sepulchre, inviting expressive silence and solemn contemplation. The task has, however, been confided to competent hands, so that we are under no apprehension as to the result. Mr. Ward is, we believe, at present in Paris, making the necessary studies for his work.

TURNER'S PICTURES.—We believe we are not premature in announcing that the pictures bequeathed by Turner to the nation will be exhibited next year at Marlborough House; the authorities of the National Gallery are now occupied in preparing them for this purpose. About one hundred is, we believe, the number which the trustees consider in a condition to be exhibited; and unquestionably such a wonderful and glorious display of landscape pictorial art as will then be seen, the public can have no idea of. While speaking of this subject, we may remark that the picture, by Turner, engraved in our last number, and called "The Fall of Carthage" is "The Morning of the Chase," representing Dido and Æneas preparing for hunting. Our engraving was copied from an old print, without any name or title; the latter was done at Turner's own expense many years back, from one of his earliest, and, in his own opinion, his finest painting of that class; it is now the property of the nation. We had never seen the picture till after the article was published; and it is many years since we saw the "Fall of Carthage;" hence the error in the title of our engraving.

THE WELLINGTON MONUMENT IN ST. PAUL'S.—It has been suggested to us that in one of the clauses of the specification for this work an ambiguity of wording occurs, liable to be misunderstood—if not at home, at least abroad: we hasten, therefore, to mention it. The clause specifies that the composition models shall be each one-fourth the size of the proposed work. Now size is a vague word; at least it is often used unprecisely, as instanced in the present case. One fourth *scale* is, we presume, what is intended. If so, it might be well to add in explanation that the area of the base of each model is to be three feet three inches by two feet three inches—that in St. Paul's set apart for the monument being thirteen feet by nine. The most usual expression "professionally," we believe, would be that the models are to be done on a *scale of three inches to a foot*. One fourth the *size* is properly one-fourth the mass; but one-fourth the *scale* is one-sixty-fourth the mass: a wide difference, and one calculated to frustrate the judicious intention of the clause, which evidently desires to provide for uniformity of scale in the competing models, and consequent facility of comparison.

EARLY ENGLISH PICTURES.—A correspondent calls our attention to the number of early English pictures that are scattered over the country in various places, especially in the metropolis and at Hampton Court, and suggests the desirableness of collecting these for the purpose of placing them in the National Gallery. He points out especially three paintings in a room in the Bridewell Prison—a building that, we believe, is no longer to be used for the purposes to which it has been lately devoted. These pictures are a half-length portrait by Hudson; a full-length by Mrs. Beale, who lived in the reign of James II.; and a portrait of a mounted cavalier, the joint production of Wootton and Richardson, who flourished in the early part of the last century. "It has always seemed to me a pity," says our

correspondent, "that though our native artists, and especially the predecessors of Reynolds, are not very numerous, we should not make the most of them, and collect specimens in our national institutions." There is little doubt that the works of these painters just named, and even of the Rileys, Walkers, Dobsons, and others, would possess little value as pictures, but they would be interesting as showing the earliest efforts of the British school; and, moreover, were the Directors of the National Gallery to procure specimens of Morland, Barry, Harlow, &c., they might thus form a gallery of our school, which undoubtedly the country ought to possess. We give large prices for early Italian paintings, of little use except as curiosities; surely a hundred or two of pounds might now and then be spared to collect a few works by those Englishmen who laid the foundation of the Arts of their country.

THE STATUE OF CHARLES JAMES FOX, from the chisel of E. Baily, R.A., has recently been erected in its place in the New House of Commons; the work is highly characteristic of the distinguished statesman, whose burly form, energetic but benign expression of physiognomy, and defiant action in oratory, are forcibly, but not offensively, represented by the sculptor.

THE ART-PATRIOTIC EXHIBITION which recently closed has added no less a sum to the general fund, in support of which the collection was made and opened, than £4732; this amount the secretary of the Royal Commission acknowledges to have received from the Committee, as profits arising from the Exhibition.

THE PICTURE GALLERY AT THE CRYSTAL PALACE is closed; and it is intended to replace it during the winter by a collection of photographs. We presume there will be another Picture Exhibition during the spring of next year: the Directors cannot doubt its being prominent among the attractions; no part of the building has been so well attended as the Picture Gallery; and although sometimes inconveniently crowded, we have heard of no accident—of nothing, indeed, that could militate against the continuation of a plan from which visitors obviously derive much enjoyment, while they are instructed. This is after all the only modern picture gallery in England to which the public is admitted altogether free: and we have obtained ample evidence that it is entirely appreciated. We trust the Directors will themselves, more directly than they seem to have done, superintend the arrangements for the next exhibition—that they will take care the pictures are properly and justly selected; and especially that they will prevent in future the very coarse way in which the pictures and drawings have been defaced by pasting large pieces of yellow paper over the frames and glasses, in many instances blotting out important parts of drawings, and in all cases giving proofs of the worst possible taste. We believe the directors may render this exhibition the most valuable part of the Palace, and earnestly hope their attention will be directed to its right and proper management.

THE TWO "BIG" WORKS OF MAROCHETTI have been removed from the Crystal Palace; and it is now admitted on all hands that the public are great gainers thereby. The friends of Marochetti have also reason to be grateful.

A PORTRAIT OF THE LORD MAYOR, David Salomons, Esq., has been hung in the Guildhall Council Chamber, by the unanimous vote of his fellow citizens. It is painted by Hart, and was in "the Exhibition" of the present year. In a few days his Lordship will have retired from the high office he has held, as chief magistrate of the city of London; and it is not too much to say that he has so discharged his duties as to have obtained the "golden opinions" of all classes and orders. He has, indeed, so acted as to have placed by "his year" a serious impediment in the way of those who seek to abolish the Corporation of London; for no "reform" could give to the city a gentleman more entitled to esteem and respect, of wiser practical knowledge as a magistrate, more thoroughly upright, more "liberal," in the best sense of the term, or with faculties better calculated to discharge honourably and usefully the various and onerous duties which fall to the lot of the Lord Mayor of London. He has upheld and extended its old renown; added to its fame for hospitality; fostered

the arts of peace; promoted the prospects of numerous charities; and seems to have represented and advocated all the private and public interests by which the welfare of the country and its dependencies could be advanced. We tender our tribute of respect to this estimable gentleman; not alone for his exertions to benefit Art, and to honour its professors, but as one who seems to have left nothing undone that ought to have been done during his official year, and who leaves office honoured, esteemed, and respected—not alone in London, but everywhere throughout the kingdom.

SIBERIAN AND CHINESE SCENERY.—A most extraordinary collection of water-colour drawings is at present "on view" in the rooms of Messrs. D. Colnaghi & Co., Pall Mall East. These drawings are by Mr. T. W. Atkinson, who, with the permission and under the protection of the late Emperor of Russia, passed seven years hunting, travelling, and sketching in those portions of the autocrat's dominions which comprehend Siberia, Chinese Tartary, and the parts adjacent—a country much of which has never before been illustrated by the pencil of the artist. We could fill a page or two with descriptions of what Mr. Atkinson has brought away with him in his pictures of lakes, mountains, deserts, steppes, waterfalls, tracks which the foot of man seems never to have trodden, and waters whose surface has never reflected ought but the heavens above them and the hills which encircle them; but our space would not permit us to do the collection justice, and we will only ask our readers to go and see for themselves.

ANTIQUÉ IVORIES.—Not very long since three of the most important antique works in ivory were brought to England for sale. The first in point of date is a Roman work of the second century, of the finest possible character: it is conjectured to be a money-box—the "coelus eboreus" of Martial. Upon the semicircular front is sculptured in high relief a figure of Bacchus holding the cantharus and thyrsus, with a panther at his feet; on his right stands a Bacchante with a tympanum, and on his left a Faun clothed in a leopard's skin, carrying a wine skin and pedum. The box is four inches in diameter; and has a sliding lid, upon which is sculptured a figure of Fortune, greatly resembling that upon the coins of Hadrian. The second of these new importations consists of a diptych of the fourth century, each plaque of ivory measuring 13½ by 5½ inches: having been originally used as covers for an "evangelarium" the sculpture is somewhat rude, but is evidently of Byzantine work,—inasmuch as the figures are giving the benediction of the hand in the peculiar manner of the early Greek Church. The figures are those of the four evangelists, and above them are representations of the Saviour with the woman of Samaria, and the sick man lifting his bed to walk. The third object is even more rare and curious, and is a small *benetioire*, or bucket, for holy water, made in one single piece of ivory, and covered with a series of scripture stories and inscriptions, one of which informs us that it was made for Otho, Emperor of Germany. From the style of work it is conjectured to have been done by Bishop Burward, of Hildesheim, about the year 983, for Otto III. Twelve scriptural scenes cover its surface, embracing the events in the life of the Saviour, from his betrayal by Judas to his appearance before St. Thomas. The details of dress, ornament, and architecture on this ivory are most elaborate and curious; it is by far the finest thing of the kind known to exist. The only similar work is that in the Ambrosian treasury at Milan, but it is by no means so highly enriched as this, which, together with the others we have named, is now possessed by Mr. Chaffers, of Grafton Street, Bond Street, who will be happy to show them to all interested in fine antique art.

PICTURES BY HAYDON.—It may not be uninteresting to those of our readers who are not acquainted with the works of Haydon to know that Mr. Barratt, of the Strand, a dealer in pictures, has in his possession four examples of his pencil, three of which are his best productions—the "Marcus Curtius," "Christ raising the Widow's Son," and "Christ's Agony in the Garden," admirably adapted to adorn the walls of one of our Schools of Design, Haydon's master-mind having been the originator of those academies. The fourth is a small whole-length figure, representing a soldier of the French

Imperial Guard musing at Waterloo; the original figure on this canvas was a portrait of the Duke of Wellington, but the duke taking exception to it as an incident not founded on truth, saying that he "never was alone on the field of Waterloo," Haydon, with his usual impetuosity of temper, transformed the hero of the field into one of his vanquished foes. He speaks of it thus in the third volume of his autobiography:—"At the first dawn of morning had a flash of an Imperial Guard, musing at Waterloo, as a fitter companion for Napoleon. Finished it over the Duke! This is the first time an Imperial Guard extinguished the Duke."

WAR MEMORIALS.—The return of peace does not appear to shut out from the public mind all thoughts of the events of the past war, for we hear of proposals in various quarters for erecting tributes to the memory of those officers who died in the Crimea, on the field of action, in the trenches, and the hospital. Eton, Harrow, Winchester, and Rugby, are collecting subscriptions to be applied in honour of the dead whose early life was passed within the walls of these respective public schools; and a memorial window is about to be placed over the principal staircase of the Army and Navy Club, Pall Mall, in commemoration of those members of the club who have fallen. "It is to be," says the *Builder*, "in the Venetian-Italian style, and will exhibit a number of tablets bearing the arms of the club, and the names and dates of the engagements. The architraves will be of Sienna marble, with panels of black marble, on which will be inscribed in letters of gold the names of the deceased officers."

MR. CHARLES KEAN has sustained his reputation, and increased the debt the public owe to him, by the manner in which he has brought out the "Midsummer Night's Dream." It is sufficient to say, that this new effort to make the drama a great teacher corresponds in excellence with its predecessors: happily, his experiments have been entirely successful; he has been fully appreciated—not always the fate of men who labour rightly for the general good. We are compelled to postpone the notice to which he is entitled at our hands.

NATURAL CLOUDS—PHOTOGRAPHY.—Nothing shows the importance and estimation in which Photography is held so much as the prominent position given to it at all the exhibitions intended for the advancement of taste, and the instruction of the people. How intimately, too, is Photography connected with Art, and with how much interest are the labours of the "pilgrims of the sun" looked for; this is evidenced by the numbers who attend the annual London and provincial exhibitions. Every good photograph, in fact, helps to extend a juster appreciation of the varied powers and applications of an invention whose influence is, no doubt, destined to play so high a part. Year by year a greater ambition is exhibited, both in the choice and composition of subjects; and every admirer of the art is familiarised with correct forms and truthful representations. We have been led into these remarks in consequence of having just seen a series of photographs of *natural clouds*, which, to artists, must possess immense value. In this series (executed for and under the direction of Messrs. Murray and Heath, of Piccadilly) many of those beautiful and fantastic forms so familiar to artists, and all who have watched the ever-varying changes of the sky, are depicted. Some of these photographs tell of coming storms, while others recall Moore's lines:

"'Twas one of those ambrosial eves
A day of storm so often leaves
At its calm setting—when the west
Opens her golden bowers of rest."

All artists and photographers will not fail to inspect this new addition to the triumphs of Photography; they will be amply repaid by the pleasure they enjoy and the instruction they derive from one of the happiest forms in which Art is made to copy Nature.

SCOTT'S POEMS.—Messrs. A. and C. Black, of Edinburgh, are preparing for publication, and will shortly issue, an illustrated edition of Scott's "Lord of the Isles," uniform with their previous editions of "Marmion" and "The Lady of the Lake." A few of the "proof sheets" have reached us, from which we are able to form the opinion that it will be equal in excellence to its predecessors. We expect in a future number to give our readers the opportunity of judging for themselves of the merits of the illustrations.

REVIEWS.

L'IMITATION DE JESUS CHRIST; ACCOMPAGNÉE DE QUATRE CENTS COPIES DE PLUS BEAUX MANUSCRITS DU VILLE AU XVII^E SIÈCLE. Published by L. CURMER, Paris.

In bygone times, when books were rare, and one volume occupied many years hard labour to write upon the vellum, such labour was thought worthy the utmost adornment of Art, and hands like those of Julio Clovio were employed to decorate the pages which emanated from the monkish *scriptorium*. Resplendent with colours and gilding, the volumes deserved the term which the French antiquaries of the last century invented for them. They are "illuminated" by a radiance peculiar to themselves; and it is only in recent times that they have been rivalled by modern biblioplists. Colour printing, by means of lithography, has lately done much to reproduce, by the thousand, transcripts of what must have singly occupied years to accomplish in the middle ages. At that period the loan of a book was an affair of anxious solicitude on both sides; and we have records of kings, princes, and churchmen, entering into bonds for the safe return of volumes, if once lent, with all the formalities which would now await the surrender of a city. A library of a few dozen volumes in those days was a kingly property; and a single book a thing to be more cherished than gold. On the decoration of valuable manuscripts large sums were spent, and the precious metals often used for their covers; stones of brilliant hue also decorated them, as well as ivory carving, and works in enamel. How, then, can we contrast the time past with the time present better than by instancing such a publication as this by M. Curmer, where we have the finest and most delicate drawings of the middle ages reproduced in all their beauty of finish, and with all their brilliancy of colour and gilding, at the rate of about fourpence each page? The famous old devotional work of Thomas à Kempis will now appear, framed as it were, in the finest mediæval drawings, exhibiting a selection of the most beautiful pages from the best manuscripts in the various great French libraries. Truly we live in a marvellous age, when such books can be placed at a cheap rate in the hands of all.

THE HISTORY AND ANTIQUITIES OF ST. DAVID'S. By W. B. JONES, M.A., and E. A. FREEMAN, M.A. Published by J. H. PARKER, London.

Situated at the extreme point of South Wales, in a lonely and desolate country, the ancient episcopal see of St. David's has been rarely visited by the tourist or antiquary. The market town of Haverfordwest is the nearest to it, but that is sixteen miles distant, and the intermediate country dreary in the extreme; wanting in trees and verdure, and exposed to the extreme violence of the sea-winds, the situation chosen for the important monastic establishment founded here, can only be accounted for on the supposition that it was considered desirable to render the contemplation of the world without the cloister as unattractive as possible, and so concentrate the mind on the religious duties within it, rendering their due observance the only pleasure left to the inmates. This arrangement, suitable to the asceticism of the early cloister, and which finds a parallel in the establishments of La Trappe, the Grand Chartreuse, and a few other continental foundations, was of course completely unfitted for the reformed church, and, consequently, non-residency and neglect became, after a time, one result of the great change; from time to time portions of the buildings fell in, and "the final fruits of sacrilege and negligence" exhibit themselves in the ruins now remaining.

It is due to the present dignitaries of the see to note their desire to arrest further decay, and it may also be stated that general subscriptions for restorations of portions of the building have been secured. The publication of the present beautiful volume will, however, do most towards protecting this venerable group of sacred buildings, by drawing attention to their claims, historical and archeological. As a piece of well-illustrated local topography, the work takes a high position. It is well and honestly done, and its authors have told "a plain, unvarnished tale" of the whole history of the see, sparing not to speak strongly, though calmly, of the neglect and errors of those who were its ordained guardians. It is pleasant to know that they now feel such neglect is over, and that a better fortune awaits this most interesting relic of old Dewisland, a fate that all Welshmen are especially bound to honour. In the present bishop they gladly recognise a protector as well as a ruler; and the appearance of so able and elegant a volume as this, is a proof of a better spirit now existing for the protection of the relics of past ages.

The reader, or home-traveller, who would wish to be fully acquainted with this comparatively untrodden district, may be entirely satisfied with the labours of the gentlemen who have here devoted themselves to the task. So minutely careful are their notes of the district, that it is visible to "the mind's eye" as we peruse their pages, and we seem to travel the ground in their company. This is a rare qualification in topographers, though the genus abounds; and aided, as the book is, by a series of very admirably executed engravings on steel and wood, it leaves little to be desired by those who study the world in their libraries. The steel engravings are by Le Keux, from drawings by Mr. O. Jewitt, and are highly creditable to both artists. Mr. Jewitt has both drawn and engraved the wood-cuts, and thus added a few more examples to the many hundreds of admirable works of this kind upon which he has been engaged for a long series of years. The details have been selected with much taste, and the descriptive letter-press is written with sound knowledge. Many of the architectural fragments given by the authors are remarkable for beauty; and all display the loving zeal which guided the ancient bishops in the decoration of the cathedral church and its palatial and monastic buildings. We cannot help feeling that the day has gone by for any further irreverence as exhibited by neglect in the modern Church of England; and it is a satisfaction to all true Protestants to see the awakened zeal for a due protection and restoration of the ancient churches of our fathers throughout the length and breadth of the land. Ignorance is always the father of desecration; and such works as the present will do more for the good cause of conservatism than any other thing. "*Tempus fugit—scripta manent*," says the old saw; and we all anxiously look to the preservation of recorded things in History or Art, which, but for the author and artist, might else have rotted in oblivion, uncared for because unknown.

THE MICROSCOPE AND ITS REVELATIONS. By WILLIAM CARPENTER, M.D., F.R.S., F.G.S. Published by J. CHURCHILL, London.

Doctor Carpenter's work on the microscope has been long expected, and much has been said as to the fresh sources of pleasure and information it would open to the man of science, as well as to the student. It is now upon our table, and we confess ourselves astonished, not only at the vast amount of practical knowledge contained in its pages, but at the clear and concise manner in which that knowledge is conveyed. It would occupy a much larger space than we can give to any one scientific subject, were we to attempt to draw attention to a tithe of the marvels so happily simplified in this noble volume. A greater boon could hardly be given to the public, and at this season too, when even the dwellers in pent-up cities go forth for their brief holiday, and can bring home so much that will, by the aid of the simplest microscope, enlighten and interest that home during the long and too frequently listless evenings of winter. We are not a little proud at having our own impression of the superiority of the chief English microscope makers over their continental rivals confirmed by such an authority as Dr. Carpenter, and on this point he assures us he not only speaks from his own conviction, but from the authority of a "highly-accomplished German microscopist, who has recently visited London for the express purpose of making the comparison." Dr. Carpenter says, "It has been the author's object throughout to guide the possessor of a microscope to the *intelligent* study of any department of natural history that his individual tastes may lead him to follow out, and his particular circumstances may give him facilities for pursuing; and he has particularly aimed to show, under each head, how small is the amount of reliable knowledge already acquired, compared with that which remains to be attained by the zealous and persevering student." Dr. Carpenter regrets also, in his preface, that so much microscopic power should run to waste in this country, and to a scientific man this is a very natural source of regret; but the very "waste" of such power contains a fertilising principle within itself which cannot but be productive of good. All reading-rooms, and mechanics' institutes, and schools, ought to have a table appropriated to a microscope, and a drawer properly constructed and filled with "objects." To this plan there are two objections: one, the expense of a *good* microscope; the other that "the objects" would be destroyed by unskilful or careless hands, if not constantly watched by the curator of the establishment. The first is the great objection: the only cheap microscope is that produced by Mr. G. Fields, of Birmingham, to whom the medal of the Society of Arts was lately awarded. Dr. Carpenter states that "the price of this instrument complete, with two eye-pieces, and two achromatic

objectives, giving a range of power from about 25 to 200 diameters, condenser on a separate stand, stage, forceps, and live-box, in a mahogany case, is only three guineas, and the maker is bound by his agreement with the Society of Arts, to keep it always in stock, so as to supply any purchaser at once." But this microscope is not sufficiently comprehensive for the purpose we have suggested, although of much value to those who seek amusement rather than science. Dr. Carpenter strongly recommends Smith and Beck's Student's Microscope, and that can be procured for seven pounds; but since the introduction of aquaria into our domestic circle, Mr. Warrington's Universal Microscope is "the tempting bait," as, by a peculiar arrangement, the compound microscope is brought to bear upon the living objects in the aquarium, when these might be either in contact with the glass sides, or not be far removed from it. The price of Mr. Warrington's microscope is *not* given, but we presume it may be obtained at Mr. Salmon's, in Fenchurch Street. For a different class of instruments, those of which the aim is not simplicity, but perfection—not the production of the best effect with limited means, but the attainment of everything that the microscope *can* accomplish, "without regard to cost or complexity"—we refer our readers to Dr. Carpenter's most valuable manual, only adding that it also contains 345 wood engravings, drawn by Mr. W. Begg, and engraved under his immediate superintendence.

ORR'S CIRCLE OF THE SCIENCES. Published by HOULSTON & STONEMAN; W. S. ORR & Co., London.

About three years since, so far as our recollection serves us, Mr. Orr entered upon the task of publishing, in cheap serial parts, a set of treatises on the first principles of science, with the application to practical pursuits, embracing every useful branch of philosophy; the entire series written in a style to render it popular, in the most extensive sense of the term, copiously illustrated by wood-cuts and diagrams to aid the reader in his studies, and published at so moderate a cost as to bring it within the reach of all who can spare a few pence each month for the purposes of self-education. To carry out effectively and satisfactorily the object of the projector, he called to his aid a number of scientific writers, eminent in their respective departments:—Dr. Bushnan, Professor Owen, Dr. Latham, Dr. E. Smith, and W. S. Dallas, F.L.S., as contributors of treatises on Organic Nature in its various developments; the Rev. J. F. Twiss, and A. Jardine, C.E., on the Mathematical Sciences; Professor Young, Mr. Breen, of the Greenwich Observatory, and Dr. Scofield on Nautical Astronomy, Practical Astronomy, and Meteorology, respectively; Dr. Scofield, on Elementary Chemistry; Professor Ansted on Physical Geography and Geology; the Rev. W. Mitchell on Crystallography; Professor Tennant on Mineralogy; Dr. Bronner, Mr. Gore, Mr. Sparling, &c., on Practical Chemistry; Rev. W. Mitchell and J. Inlay on Mechanical Philosophy.

This array of names, to all who are acquainted with the qualifications of these gentlemen, will prove a sufficient guarantee for the truth and accuracy of their labours, which have resulted in the issue of nine volumes,—or rather of eight at present, for the ninth is not yet quite completed,—forming a sort of miniature library of useful science. We can readily understand how in this age, when the pursuit of knowledge of every kind is eagerly followed by so many with craving appetites, such a table of substantial intellectual viands must prove most acceptable. On a careful examination of these volumes we are particularly struck with the vast amount of information contained in them, and with the concise, clear, yet comprehensive form in which it is conveyed, while there is no sacrifice of learning in order to attain simplicity: the aim of the writers has evidently been to combine the two. There will be no dearth of philosophers wherever the contents of these volumes have been mastered, and they certainly come within the acquisition of any whose intelligence is united to a sincere desire to perfect themselves in scientific knowledge—that kind of knowledge which, at the present time especially, is most anxiously sought after, as a "necessity" of our day.

Mr. Orr has done good service to education by the production of these and other excellent educational works; and we hear that he is about to follow up what has been already done, by the publication of another "Circle" of similar treatises on the "Application of Science to Industrial and Decorative Art," a series in the preparation of which he has already enlisted a number of contributors distinguished for their scientific and practical attainments. Of this series the first part is announced to appear in the present month.

CALISTHENICS; OR, THE ELEMENTS OF BODILY CULTURE ON PESTALOZZIAN PRINCIPLES: A CONTRIBUTION TO PRACTICAL EDUCATION. By HENRY DE LASPÉE. Published by DARTON & Co., London.

Fully admitting the importance of the subject of which M. De Laspée's book treats, we yet think his end might be attained by a less pretentious volume than this. Upwards of one hundred and sixty explanatory pages, most of them preceded by a sheet of illustrations exhibiting a number of boys and girls performing all kinds of possible—and, as it seems to us, impossible—bodily contortions, are surely unnecessary to the development of his theories: it is dragging out the subject to an absurd length, besides implicitly making his book costly, as we presume. At least one-half of these illustrations are in our opinion useless, unless the pupil is intended for a harlequin or an opera-dancer, while many of them must have the effect of making the practice of bodily culture appear ridiculous. M. De Laspée is strongly opposed to gymnastic exercises, as tending to induce a brute physical strength separate and distinct from the intellectual life, and instances the revolutionary outbreak in Germany, in 1848, as the results of the gymnastic teachings throughout the whole of that country. "Just as the practice of gymnastics," he says, "was in full operation, and its effect on body and mind had reached its climax, the unnatural strength of the body, and its thereby excited senses, sought an outlet; thought, reflection, and good sense succumbed; and all that government did to arrest the monster in its progress could not prevent its bursting out into a revolution. The strongest men—the teachers and their best disciples in muscular power—became its leaders. Their strength, at the first outbreak of the revolution, struck every one with awe and terror, and all submitted to their dictates. Thus physical strength once more attained supremacy, and before it lay mighty princes and nations prostrate. Had this bodily agent been the obedient servant of a highly-endowed mind—had it been guided by wisdom and understanding, the conquests obtained by it would have remained in its possession. But it was not so, and strength having triumphed over the weakness around it, its warlike spirit turned against itself, until, at last, refuge from its horrors was sought in the counsel and aid of intellect. The extreme of intellect conquered the extreme of bodily culture."

In the prefatory "Instructions" are some sensible remarks on mental training; but we cannot see that the utmost proficiency in calisthenic exercises can operate beneficially on the mind; or, in other words, how the culture of the body can promote mental education, except as the health of the body generally produces a healthy tone of mind, and capacitates it for receiving and retaining what it may be taught. M. De Laspée contends for more than this when he asserts that his arguments, though limited to bodily culture, may with equal effect be applied to every other branch of study: we doubt this, but nevertheless recommend his book as a well-directed attempt to carry out a most useful branch of physical education, though, as before stated, his exercises might be advantageously curtailed.

THE MARRIAGE OF POCAHONTAS. Painted by H. BLUECKNER. Engraved and published by J. C. M'RAE, New York.

"During the lovely Indian summer-time, in the autumn of 1608, there was a marriage on the banks of the Powhatan, where the English had laid the corner-stone of the great fabric of Anglo-Saxon empire in the New World. It was celebrated in the second church which the English settlers had erected there. Like their first, which fire had devoured the previous winter, it was a rude structure, whose roof rested upon rough pine columns, fresh from the virgin forest, and whose adornings were little indebted to the hand of Art. The officiating priest was 'good Master Hunter,' who had lost all his books by the conflagration. . . . About five years later there was another marriage at Old Jamestown (the name given to the locality in question), in honour of which history, poetry, and song, have been employed. The bridegroom was 'Master John Rolfe, an honest gentleman, and of good behaviour,' from the realm of England; and the bride was a princess royal, named Matoa, or Pocahontas, the well-beloved daughter of the emperor of the great Powhatan confederacy, on the Virginian peninsula. The officiating priest was Master Alexander Whitaker, a noble apostle of Christianity, who went to Virginia for the cure of souls." We may add to this that the royal bride paid a visit to England, was entertained by Dr. King, then Bishop of London, "with festival state and pomp," and died at Gravesend, in 1617, before she had reached the age of

twenty-two. From her many of the leading families in Virginia trace their lineage.

This little bit of history may be taken as the key to the large engraving entitled the "Marriage of Pocahontas," recently received from New York. The print is not from a finished picture, but from a cartoon, and hence there is an absence of delicacy, as well as of effect, in the engraving, which probably would have been supplied if copied from a finished work. The name of the painter is new to us among the artists of America, but his composition is evidently not that of a "prentice hand;" it is carried out with no little skill, judgment, and spirit, in the grouping of the large number of figures introduced, and to many of the heads he has given character and good expression. The subject is of a highly interesting nature, and well adapted for a picture—the mixed assemblage of the half-civilised, yet not inelegant, natives, and of the early European settlers in the costumes of the period, constitute a most picturesque group. It would be folly to expect in a large historical work like this as much excellence and as few defects, from the hand of an American artist, as we should look for from that of a European with all the means and appliances of Art-study at his elbow; yet we have seen as pretentious, and far less successful, works of a similar class in England and elsewhere. Mr. Blueckner's great fault—and in a composition of this nature the fault cannot be overlooked—is defective drawing; several of the figures are most incorrect.

There are portions of Mr. M'RAE's work which deserve to be well spoken of: the engraving is a mixture of line and stipple, but it seems to us as if more than one hand had been employed on it. Taking it as a whole, the print is very creditable to the rising school of Art in America, and shows an earnest and laudable desire to strive after an honourable position among the competitors for the artist's wreath. With the "Marriage of Pocahontas" we received two other prints, by the same engraver, from portraits by T. Hicks—one of Dr. Wainwright, Bishop of New York; the other of Mr. H. W. Beecher, brother of Mrs. Beecher Stowe: but so indifferently printed, that it would be unjust to the engraver to offer any opinion on his work.

APHORISMS IN DRAWING. By the REV. S. C. MALAN, M.A. Published by LONGMAN & Co., London.

Precepts expressed in concise and intelligible language, as we find them in this little book, are more apt to fasten themselves on the memory than when extended to considerable, and often unnecessary, length; mere verbosity is not unfrequently mistaken for minute explanation—there is such a thing as "darkening counsel by words." Mr. Malan's "Aphorisms" are not new, but they are quite to the point: he is an amateur only, and professes nothing more; he has, however, studied well the principles of Art, and lays down some rules which may be of service to others. There is a novelty, moreover, in this method of giving instruction that is not without its value.

THE OXYMEL PROCESS IN PHOTOGRAPHY. By P. H. DELAMOTTE, F.S.A. Published by CHAPMAN & HALL, London.

Oxymel, a new chemical, is, according to Mr. Delamotte, "undoubtedly the most valuable discovery in the art of photography that has been made since Mr. Scott Archer introduced collodion. By the help of oxymel all the beautiful delicacy of the finest collodion pictures may be obtained, with the convenience of the paper process, with much more certainty, and much greater ease." We recommend the amateur in photography to look into this pamphlet, which explains the oxymel process, besides giving many hints respecting the art generally.

ILLUSTRATED HAND-BOOK OF MILITARY ENGINEERING, AND OF THE IMPLEMENTS OF WAR. By R. FORREST. Published by DAY & SON, London.

Although this work would probably have found a year or two since, when the public mind was engrossed with the details of warlike operations, a larger number of persons to consult its pages than it is now likely to do, they are still not without utility, inasmuch as the book is designed to illustrate and render intelligible to non-professional readers the various necessary technical expressions found in all historical or popular descriptions of modern warfare. It may be termed a dictionary of all words and objects employed in the military service, each of which is fully explained, and, where necessary, illustrated by well-executed engravings. We turn over these illustrated leaves and lament to see how much of genius and ingenuity man has displayed to destroy his fellow-man, in this terrible array of guns, mortars, rockets, and all the other paraphernalia of wholesale bloodshed.

THE ART-JOURNAL.

LONDON, DECEMBER 1, 1856.

WITH the New Year will be commenced the third volume of the present, or "Royal Gallery" Series, and the nineteenth annual issue of the *Art-Journal*. The Editor, in compliance with long-established custom, desires briefly to address subscribers, in the hope they have derived satisfaction from his past labours, and in full assurance that his future arrangements will give increased interest and value to a work that has so long enjoyed public favour, as a means of rightly directing taste and extending the beneficial influence of Art throughout the community.

Year after year supplies new evidence that Art is advantageously progressing. In nearly every provincial town of note in the kingdom there is now some school or class—public or private—in which Art is an element of education; while in our larger cities it has become almost as much a necessity, as it has heretofore been a luxury, of life.

Many auspicious circumstances have combined to produce this happy result. Previously to the memorable year—1851—when, under the gracious influence of the Prince-Consort, British Industrial Art received its first great impetus, conviction was gradually making way among manufacturers that, while the "mercantile value of Art" was determined only by excellence, that excellence was to be obtained by British energy, enterprise, and capital, if the producer were instructed in what it consisted, and the public were taught its proper appreciation, by contrasting and comparing it with what was inferior or bad. "The Great Exhibition" assuredly did that in one year which twenty years of mere oral or written teaching could not have effected. The general progress of the national mind; the establishment of numerous branches of the Department of Science and Art; the great increase of provincial Art-exhibitions; the continued labours of "the Art-Union of London," and its several laudable imitators; the very large transfer of investments from works of "ancient masters" to those of modern Artists; the wide spread of Photography; the advantages which Art has so extensively derived from Science;—these and other causes have been so beneficially productive as to justify the assertion that in every class of Art and of industrial produce, within the last few years, there has been a large and manifest improvement.

We desire to avoid the self-praise which is never a recommendation; but we cannot appear presumptuous if we enjoy the conviction that our own labours have aided in producing that general advancement in the Arts of our country—Fine and Industrial—which is now

universally observed and admitted. During nearly the whole of the last eighteen years the *Art-Journal* has been—as it now is—their only representative and exponent, not alone in England but in Europe, if we except a few limited periodical issues in Germany and France. At the commencement of our task the manufacturer who strove to attain eminence found publicity beyond his reach; while Science and Literature had many journals devoted to their interests, the Arts had none. The public had no means of ascertaining how to distinguish the producers of excellence from those who circulated inferiority: there was consequently a general absence of that recognition and encouragement, without which rewards are as likely to be awarded to mediocrity as to merit and desert.

Our labours to advance the interests of the Artist, the Manufacturer, and the Artisan, have been largely appreciated—and they have been rewarded: we have earnestly striven to obtain confidence, and we have obtained it; and we may enjoy the satisfaction which arises from the consciousness that success has been achieved by continuous effort for its attainment.

If in Great Britain we have been the means of advancing these important interests,—and we are justified in hence deriving satisfaction,—we may believe that our labours are still more useful—as they certainly have been appreciated—in THE UNITED STATES OF AMERICA. We enjoy, and have long enjoyed, a large circulation among a people who are successfully and earnestly striving to attain excellence in all things: and whose progress in Art has been commensurate with their advance in all the utilities of life.

Our subscribers may be assured of our utmost exertions to keep the place we have secured for this Journal, and to extend its circulation by, as far as possible, augmenting its interest and value as a medium of communication between Art-producers and the public.

The year 1857 will be commemorated by an exhibition second in importance only to that of 1851: the picture wealth of Great Britain will be developed in Manchester; it will be our task to report fully its assemblage of "Art-treasures."

We have prepared an Illustrated Tour of the Thames, from its rise to its fall (written by Mr. and Mrs. S. C. HALL), with a view to picture the leading places and objects of interest on the banks of "the King of Island Rivers." It is impossible to find a theme more congenial to the artist, or one that affords to the pencil a wider scope. The illustrations of this tour will consist of numerous engravings on wood of the highest order.

The Rev. Charles Boutell, M.A., whose pursuits have peculiarly qualified him for the task, has undertaken for this Journal a series of papers entitled, "The Crystal Palace: a Teacher from Ancient Art," his object being to direct the student to examples available in a school for study, to which there is always access.

Mr. Christopher Dresser, the lecturer on botany in the Department of Science and Art, undertakes a series of articles under the title of "Botany, as adapted to the Arts and Art-Manufacture:" these will be largely illustrated.

Professor Hunt will contribute a series of papers on the application of improved machinery and materials to the productions of Art-manufacture.

We shall continue to represent, by descriptions and engravings, "the progress of British Art-manufacture," selecting such productions as may be honourable to the producer and instructive to the public.

A series of papers will also be issued descriptive of the contents of the leading collections of

modern Art. It will be remembered that several years ago we published "Visits to Private Galleries," these were, in all cases, of the works of ancient masters; galleries of modern Art were then only in course of formation; there are now, however, many in England, in which are gathered famous and valuable productions of British artists; their possessors are, principally, the merchants and manufacturers of the kingdom, who have been of late years the wise and liberal patrons of the artist. The time has therefore arrived when such collections—rare and numerous, and of great value—should be fully described in the *Art-Journal*, for the honour of those who acquire, as well as of those who produce, them.

The articles which have for some time constituted a feature of the *Art-Journal*—"British Artists: their Style and Character"—will be continued monthly, with engraved illustrations.

These announcements refer to such articles as form continued series: our subscribers will believe that in all the other literary departments of the *Art-Journal* we shall avail ourselves of every possible means by which the best assistance can be obtained, in association with our own earnest and continuous labours.

With regard to the more prominent illustrations of the work, we continue to enjoy the distinguished honour conferred upon us by permission to introduce into the *Art-Journal* engravings from pictures in the private collections of Her Most Gracious Majesty the Queen, and His Royal Highness Prince Albert. Among those that will probably appear during the ensuing year are—Wilkie's picture of "King George IV. entering Holyrood Palace;" "The Spanish Letter-writer," Philip; "The Princess of Belgium," Winterhalter; "The Beauty of Albano," Reidel; "The Good Samaritan," Sir C. L. Eastlake; "The Marmozettes," Sir E. Landseer; "The Seraglio," Danby; "The Harvest Field," Tschaggany; "Henrietta Maria," Vandyke; "The Sea-port," Claude; "The Farm at Lacken," Rubens; "St. Agnes," Domenichino, &c. &c.

Examples of the genius of Sculpture—British and Foreign—will also be continued from time to time.

And arrangements are in progress for engraving in line, and publishing in the *Art-Journal*, "The Turner Bequest"—the whole of the pictures bequeathed to the nation by the late J. M. W. Turner, R.A. The plan upon which this great undertaking will be conducted will be explained in due course; but our subscribers will believe that we shall so discharge this task as to be commensurate with its importance, honourable to the memory of the great artist, and worthy of the nation by which so precious a gift has been acquired, for the delight and instruction of its people; and which, by the art of the engraver, will thus minister to all classes and orders throughout the world.

The Editor of the *Art-Journal*, in thus reverting to the past, and communicating his plans for the future, has only to express gratitude for the large support the Journal has received, at home and abroad, and the hope that his efforts, and those of the many excellent and valuable assistants with whom he has the happiness to be associated, will continue to maintain the *Art-Journal* in public favour, and justify the expectation that its circulation will be proportionate to the largely increased and continually increasing interest manifested throughout Great Britain, its dependencies, in the United States, and in all foreign countries, in the Fine Arts and the Arts Industrial.

4, LANCASTER PLACE, STRAND.

THE MONKS OF THE MIDDLE AGES.*

BY THE REV. EDWARD L. CUTTS, B.A.

THE Church of a monastery was almost always a cross church, with a nave and aisles; a central tower (in Cistercian churches the tower was only to rise one story above the roof); transepts, which usually have three chapels on the north side of each transept, or an aisle divided into three chapels by parclose screens; a choir with or without aisles; a retro-choir or presbytery; and often a Lady chapel, east of the presbytery, or in some instances parallel with the choir.

The entrance for the monks was usually in the south side opposite to the eastern alley of the cloisters; there was also in Cistercian churches a newel stair in the south transept, by means of which the monks could descend from their dormitory (which was in the upper story of the east side of the cloister court) into the church for the night services, without going into the open air. The principal entrance for the laity was on the north side, and was usually provided with a porch. The great western entrance was chiefly used for processions; the great entrance gate in the enclosure wall of the abbey being usually opposite to it or nearly so. In several instances stones have been found, set in the pavements of the naves of conventual churches, to mark the places where the different members of the convent were to stand before they issued forth in procession, amidst the tolling of the great bell, with cross and banner, and chaunted psalms, to meet the abbot at the abbey-gate, on his return from an absence, or any person to whom it was fitting that the convent should show such honour.

The internal arrangements of an abbey-church were very nearly like those of our cathedrals. The convent occupied the stalls in the choir; the place of the abbot was in the first stall on the right-hand side to one entering from the west—it is still appropriated to the dean in cathedrals; in the corresponding stall on the other side sat the prior; the

When there was the shrine of a noted saint, it was placed in the presbytery, behind the high-altar; and here, and in the choir aisles, were frequently placed the monuments of the abbots, and of founders and distinguished benefactors of the house; sometimes heads of the house and founders were buried in the chapter-house.

It would require a more elaborate description than our plan will admit to endeavour to bring before the reader's mind's-eye one of these abbey churches

A SEMI-CHOIR OF MINORESSES.

before its spoliation;—when the sculptures were unutilized and the paintings fresh, and all the windows filled with their stained glass, and the choir was hung with hangings, and banners and tapestries waved from the arches of the triforium, and the altar shone gloriously with jewelled plate, and the monuments of abbots and nobles were still perfect, and the wax tapers burned night and day* in the hearers, twinkling on the solemn effigies below, and glancing upon the tarnished armour and the dusty banners which hung over the tombs, while the cowed monks sat in their stalls and prayed. Or when, on some high festival, the convent walked round the lofty aisles in procession, two and two, clad in rich copes, preceded by cross and banner, with swinging censers pouring forth clouds of incense, while one of those angel boy's voices which we still sometimes hear in cathedrals chanted the solemn litany; the pure sweet ringing voice floating along the vaulted aisles until it was lost in the swell of the chorus of the whole procession, *Ora! Ora! Ora! pro nobis!*

The Cloister was usually situated on the south side of the nave of the church, so that the nave formed its north side, and the south transept a part of its eastern side; but sometimes, from reasons of local convenience, the cloister was on the north side of the nave, and then the relative positions of the other buildings were similarly transposed.

The Chapter-house was always on the east side of the court. In establishments of secular canons it seems to have been always multisided,† with a central pillar to support its groining, and a lofty, conical, lead-covered roof. In these instances it is placed in the open space eastward of the cloister, and is usually approached by a passage from the east side of the cloister court. In the houses of all the other orders‡ the chapter-house is rectangular, even where the church is a cathedral. Usually, then, the chapter-house is a rectangular building on the east side of the cloister, and frequently its longest axis is

proper stall, robed in cope and amice, mitre and crozier, beating time to the chant; a kneeling canon supports the bishop's service-book.

* Henry VII. agreed with the Abbot and Convent of Westminster that there should be four tapers burning continually at his tomb—two at the sides, and two at the ends, each eleven feet long, and twelve pounds in weight; thirty tapers, &c., in the hearse; and four torches to be held about it at his weekly obit; and one hundred tapers nine feet long, and twenty-four torches of twice the weight, to be lighted at his anniversary.

† The chapter-houses attached to the cathedrals of York, Salisbury, and Wells, are octagonal; those of Hereford and Lincoln, decagonal; Lichfield, polygonal; Worcester is circular. All these were built by secular canons.

‡ There are only two exceptions hitherto observed: that of the Benedictine Abbey of Westminster, which is polygonal, and that of Thornton Abbey, of regular canons, which is octagonal.

east and west—at Durham it has an eastern apsis. It was a large and handsome room, with a good deal of architectural ornament; often the western end of it is divided off as a vestibule or ante-room; and generally it is so large as to be divided into two or three aisles by rows of pillars. Internally, rows of stalls or benches were arranged round the walls for the convent; there was a higher seat at the east end for the abbot or prior, and a desk in the middle from which certain things were read. Every day after the service called Tierce, the convent walked in procession from the choir to the chapter-house, and took their proper places. When the abbot had taken his place, the monks descended one step and howed; he returned their salutation, and all took their seats. A sentence of the rule of the order was read by one of the novices from the desk, and the abbot, or in his absence the prior, delivered an explanatory or hortatory sermon upon it; then, from another portion of the book was read the names of brethren, and benefactors, and persons who had been received into fraternity, whose decease had happened on that day of the year; and the convent prayed a *requiescant in pace* for their souls, and the souls of all the faithful departed this life. Then members of the convent who had been guilty of slight breaches of discipline con-

fessed them, kneeling upon a low stool in the middle, and on a bow from the abbot, intimating his remission of the breach, they resumed their seats. If any had a complaint to make against any brother, it was here made and adjudged. Convent business was also transacted. The wood-cut gives an example of the kind. Henry VII. had made grants to Westminster Abbey, on condition that the convent performed certain religious services on his behalf; and in order that the services should not fall into disuse, he directed that yearly, at a certain period, the chief-justice, or the king's attorney, or the recorder of London, should attend in chapter, and the abstract of the grant and agreement between the king and the convent should be read. The grant which was thus to be read still exists in the British Museum; it is written in a volume superbly

MONKS AND LAWYERS.

bound, with the royal seals attached in silver cases; it is from the illuminated letter at the head of one of the deeds that our wood-cut is taken. It rudely represents the chapter-house, with the chief-justice and a group of lawyers on one side, the abbot and convent on the other, and a monk reading the grant from the desk in the midst.

Dividing the south transept from the chapter-house is usually a narrow apartment; the description of Durham, drawn up soon after the Dissolution, says that it was the "Locutory." In other cases it seems to be merely a passage from the cloister-court to the space beyond.*

* In which space the abbot's lodging is often situated, so that it may have been the abbot's entrance to the

A SEMI-CHOIR OF FRANCISCAN FRIARS.

precentor sat in the middle stall on the south side; the succentor in the middle stall on the north side.

We have given above a beautiful little picture of a semi-choir of Franciscan friars, from a fourteenth century psalter in the British Museum (Domitian, A. 17). It is from a large picture, which gives a beautiful representation of the interior of the choir of the church. On the next column is an engraving of a similar semi-choir of minor nuns, which also is only a portion of a large church interior.†

* Continued from p. 343.

† In the same MS. is still another similar picture of an interior of a cathedral, with a choir of secular canons seated in the stalls, robed in short surplices over long black frocks, their furred almices are hung over the elbows of the stalls; and they have not the four-square canon's cap, but some have the hood over their heads, and some have not. They are presided over by the bishop, who sits in his

Again, on the other (south) side of the chapter-house is often found a small apartment, which some have conjectured to be the penitential cell.*

The Refectory, or Fraternity, was the dining-hall of the convent. It is sometimes on the east side of the court, ranging with the south transept and the chapter-house, and running north and south, and has the kitchen behind it: this seems to be especially a Cistercian arrangement. In other cases, it forms the south side of the cloister court, lying parallel with the nave of the church. Very commonly it has a row of pillars down the centre, to support the groined roof. It was arranged, like all mediæval halls, with a dais at the upper end and a screen at the lower. In place of the oriel window of mediæval halls, there was a pulpit, which was often in the embrasure of a quasi-oriel window, in which a novice read some edifying book during meals.

The remaining apartments of the cloister-court it is more difficult to appropriate. In some of the great Cistercian houses whose ground-plan can be traced—as Fountains, Salley, Netley, &c.—we believe that the long apartment which is formed on the west side of the cloister was the hall of the Hospitium, with chambers over it.

About the middle of the south side there is a long room, whose longer axis lies north and south; and a smaller room on each side of it. We can only conjecture that the larger of these may have been the Misericorde, a room to which the monks retired after refectory to converse, and to take their allowance of wine, or other indulgences in diet which were allowed to them; and some quotations in Fosbroke would lead us to imagine that the monks dined here on feast days. It would answer to the great chamber of mediæval houses, and in some respects to the Combination-room† of modern colleges.

The Dormitory in these Cistercian houses, we believe, was over the refectory, and the Scriptorium over the chapter-house. But in the uncertainty which at present exists on these points of monastic arrangement, we cannot speak with any degree of certainty; but we throw together some data on the subject in the subjoined note.‡ What we have called the hospitium, with chambers over it, Mr. Bloxam would call an ambulatory, with the dormitory over it. The Dormitory, wherever situated, was a long room, with a vaulted or open timber roof, with the pallets arranged in rows on each side against the wall. The prior or sub-prior usually slept in the Dormitory, with a light burning near him, in order to maintain order. The monks

church and chapter. Other conjectures are that it may have been sometimes the vestry. At Netley it has a door at the west, with a trefoil light over it, a two-light window at the east, two niches, like monumental niches, in its north and south walls, and a piscina at the east end of its south wall.

* This we believe to be a mere vague conjecture, but we are not prepared to offer any other explanation of its use.

† A room adjoining the hall, to which the fellows retire after dinner to take their wine and converse.

‡ The above appropriation of the rooms which surround the cloister-court differs, in some respects, from that given by recent writers, whose opinion is entitled to great respect. What we have called the refectory, Mr. M. H. Bloxam would call an ambulatory; and the large room on the south side of the cloister, the refectory. Mr. Walbran, in his description of Fountains Abbey, agrees with Mr. Bloxam in calling the latter the refectory; but he calls the former the frater-house (a term which is usually considered to apply to the refectory).

In the plan of the ninth-century Benedictine monastery of St. Gall, published in the *Archæological Journal* for June, 1848, the dormitory is on the west, with the pisalis under it; the refectory on the south, with the clothes-store above; the cellar on the west, with the larders above. In the plan of Canterbury Cathedral, a Benedictine church, as it existed in the latter half of the twelfth century, the church was on the north, the chapter-house and dormitory on the east, and the refectory, parallel with the church, on the north, and the cellar on the west. At the Benedictine monastery of Durham, the church was on the north, the chapter-house and leocutory on the east, the refectory on the south, and the dormitory on the west. At the Augustinian Regular Priory of Bridlington, the church was on the north, the frater (refectory) on the south, the chapter-house on the east, the dortor also on the east, up a stair twenty steps high, and the west side was occupied by the prior's lodgings.

At the Premonstratensian Abbey of Easby, the church is on the north, the transept, passage, chapter-house, and small apartments on the east, the refectory on the south, and on the west two large apartments, with a passage between them. The Rev. J. F. Turner, Chaplain of Bishop Cozin's Hall, Durham, describes these as the common house and kitchen, and places the dormitory in a building west of them, at a very inconvenient distance from the church.

slept in the same habits* which they wore in the daytime.

The Abbot's Lodging sometimes formed a portion of one of the monastic courts, as at St. Mary, Bridlington, where it formed the western side of the cloister-court; but more usually it was a detached house, precisely similar to the contemporary unfortified houses of laymen of similar rank and wealth. No particular site relative to the monastic buildings was appropriated to it; it was erected wherever was most convenient within the abbey enclosure. The principal rooms of an abbot's house are the Hall, the Great Chamber, the Kitchen, Buttry, Cellars, &c., the Chambers, and the Chapel. We must remember that the abbots of the greater houses were powerful noblemen; the abbots of the smaller houses were equal in rank and wealth to country gentlemen. They had a very constant succession of noble and gentle guests, whose entertainment was such as their rank and habits required. All this involved a suitable habitation and establishment; and all this must be borne in mind when we endeavour to picture to ourselves an abbot's lodging. To give an idea of the magnitude of some of the abbot's houses, we may record that the hall of the Abbot of Fountains was divided by two rows of pillars into a centre and aisles, and that it was 170 feet long by 70 feet wide.† Half a dozen noble guests, with their retinues of knights and squires, and men-at-arms and lacqueys, and all the abbot's men to boot, would be lost in such a hall. On the great feast-days it might, perhaps, be comfortably filled; but even such a hall would hardly contain the companies who were sometimes entertained, on such great days—for instance, as an abbot's installation-day, when, it is on record, that an abbot of one of the greater houses would give a feast to three or four thousand people.

Of the lodgings of the superiors of smaller houses, we may take that of the Prior of St. Mary's, Bridlington, as an example. It is very accurately described by King Henry's commissioners; it formed the west side of the cloister-court; it contained a hall, with an undercroft, eighteen paces‡ long from the screen to the dais, and ten paces wide; on its north side a great chamber, twenty paces long and nineteen wide; at the west end of the great chamber the prior's sleeping-chamber, and over that a garret; on the east side of the same chamber a little chamber and a closet; at the south end of the hall the buttry and pantry, and a chamber called the Auditor's Chamber; at the same end of the hall a fair parlour, called the Low Summer Parlour; and over it another fair chamber, and adjoining that

A PRESENT OF FISH.

three little chambers for servants; at the south end of the hall the Prior's Kitchen, with three houses covered with lead, and adjoining it a chamber called the South Cellar's Chamber.§

There were several other buildings of a monastery, which were sometimes detached, and placed as convenience dictated. The Infirmary especially seems to have been more commonly detached; in many cases it had its own kitchen, and refectory, and chapel, and chambers, which sometimes were ar-

* The ordinary fashion of the time was to sleep without any clothing whatever.

† The hall of the Royal Palace of Winchester, erected at the same period, was 111 feet by 55 feet 9 inches.

‡ Its total length would perhaps be about twenty-four paces.

§ The above wood-cut, from the Harleian MS., 1527, represents, probably, the cellarer of a Dominican convent receiving a donation of a fish. It curiously suggests the scene depicted in Sir Edwin Landseer's "Bolton Abbey in the Olden Time."

ranged round a court, and formed a complete little separate establishment.

The Hospitium, or Guest-house, was sometimes detached; but more usually it seems to have formed a portion of an outer court, westward of the cloister-court, which court was entered from the great gates, or from one of the outer gates of the abbey. In Cistercian houses, as we have said, the guest-house, with its hall below and its chambers above, probably occupied the west side of the cloister-court, and would therefore form the eastern range of buildings of this outer court. At St. Mary's, Bridlington, where the prior's lodging occupied this position, the "lodgings and stables for strangers" were on the north side of this outer court. The guest-houses were often of great extent and magnificence. The Guesten-hall of St. Augustine's, Canterbury, still remains, and is a very noble building, 150 feet long by 50 broad, of Norman date, raised on an undercroft. The Guesten-hall of Worcester also remains, a very noble building on an undercroft, with a fine carved timber roof, and portions of the painting which decorated the wall behind the dais still remaining.* Besides the hall, the guest-house contained often a great-chamber (answering to our modern drawing-room) and sleeping-chambers, and often a chapel, in which service was performed for guests—for in those days it was the custom always to hear prayers before dinner and supper.

Thus, at Durham, we are told that a famous house of hospitality was kept within the abbey garth, called the Guest-hall, and was situate in the west side, towards the water. The terror of the house was the master thereof, as one appointed to give entertainment to all estates, noble, gentle, or what other degree soever came thither as strangers. Their entertainment was not inferior to that of any place in England, both for the goodness of their diet, the clean and neat furniture of their lodgings, and generally all things necessary for travellers; and, with this entertainment, no man was required to depart while he continued honest and of good behaviour. This hall was a stately place, not unlike the body of a church, supported on each side by very fine pillars, and in the midst of the hall a long range for the fire. The chambers and lodgings belonging to it were kept very clean and richly furnished.

There is a passage in the correspondence of Coldingham Priory (published by the Surties Society, 1841, p. 52) which gives us a graphic sketch of the arrival of guests at a monastery:—"On St. Alban's-day, June 17 [year not given—it was towards the end of Edward III.], the two monks, with a company of certain secular persons, came riding into the gateway of the monastery about nine o'clock in the morning. This day happened to be Sunday, but they were hospitably and reverently received, had lodgings assigned them, a special mass service performed for them, and after a refectory and washing their feet, it being supposed that they were about to pursue their journey to London the next morning, they were left at an early hour to take repose. While the bell was summoning the rest of the brotherhood to vespers, the monk who had been in attendance upon them (the hospitaller) having gone with the rest to sing his chant in the choir, the secular persons appear to have asked the two monks to take a walk with them to look at the Castle of Durham," &c.†

There could hardly have been any place in the middle ages which could have presented such a constant succession of picturesque scenes as the Hospitium of a monastery. And what a contrast must often have existed between the Hospitium and the Cloister; here a crowd of people of every degree—nobles and ladies, knights and dames, traders with their wares, minstrels with their songs and juggling tricks, monks and clerks, palmers, friars, beggars—bustling about the court or crowding the long tables of the hall; and, a few paces off, the dark-frocked monks, with faces buried in their cowl, pacing the ambulatory in silent meditation, or sitting at their meagre refectory, enlivened only by the monotonous sound of the novice's voice who is reading a homily from the pulpit!‡

* See an account of this hall, with pen-and-ink sketches, by Mr. Street, in the volume of the Worcester Architectural Society for 1854.

† Quoted by Archdeacon Churton in a paper read before the York-hire Architectural Society in 1853.

‡ The cut represents a group of Cistercian monks, from

Many of the remaining buildings of the monastery were arranged around this outer court. Ingulphus tells us that the second court of the Saxon monastery of Croyland (about 875 A.D.) had the gate on the north, and the almonry near it—a very usual position for it; the shops of the tailors and

GROUP OF CISTERCIAN MONKS.

shoe-makers, the hall of the novices, and the abbot's lodgings on the east; the guest-hall and its chambers on the south; and the stable-house, and granary, and bake-house on the west. The Gate-house was usually a large and handsome tower, with the porter's lodge on one side of the arched entrance, and often a strong room on the other, which served as the prison of the manor-court of the convent, and often a handsome room over the entrance, in which the manorial court was held. In the middle of this court was often a stone Cross, round which markets and fairs seem often to have been held.

In the "Vision of Piers Ploughman" an interesting description is given of a Dominican convent of the fourteenth century. We will not trouble the reader with the very archaic original, but will give him a paraphrase of it. The ploughman, on approaching, was so bewildered by the magnitude and beauty, that for a long time he could distinguish nothing certainly but stately buildings of stone, pillars carved and painted, and great windows well wrought. He enters the quadrangle, and notices the cross standing in the centre, surrounded with tabernacle-work: he enters the minster (church), and describes the arches carved and gilded, the wide windows full of shields of arms and merchants' marks on stained glass, the high tombs under canopies, with effigies, armed, in alabaster, and lovely ladies lying by their sides in many gay garments. He passes into the cloister and sees it pillared and painted, and covered with lead and paved with tiles, and conduits of white metal pouring their water into bronze (latten) lavatories beautifully wrought. The chapter-house he says was wrought like a great church, carved and painted with seemly stalls, like a parliament-house. Then he went into the frater, and found it a hall fit for a knight and his household, with broad boards about and clean benches and windows, wrought as a church. Then he wandered all about—

"And seigh halles ful heigh, and houses ful noble,
Chambres with chymneys, and chapeles gaye,
And kychnes for an high kynge in castels to holden,
And their douroure ydight with dores ful stronge,
Ferremye, and fraitour, with fele more houses,
And all strong stone wall, stern open herthe,
With gay garites and grete, and ich hole yglased,
And other houses ynowe to herberwe the queene."

Every monastery had a number of dependent establishments of greater or less size; cells on its distant estates; granges on its manors; chapels in places where the abbey tenants were at a distance from a church; and often hermitages under its protection. Of the monastic cells we have already spoken in describing the office of prior. The one or two brethren who were placed in a cell to manage the distant estates of the monastery would probably be chosen rather for their qualities as prudent stewards than for their piety; the com-

a MS. (Vitellius A. 13) in the British Museum. It shows some of them sitting with hands crossed and concealed in their sleeves—an attitude which was considered modest and respectful in the presence of superiors.

mand of monecy which their office gave them, and their distance from the supervision of their ecclesiastical superiors, brought them under temptation, and it is probably in these cells, and among the brethren who superintended the granges, and the officials who could leave the monastery at pleasure on the plea of convent business, that we are to look for the irregularities of which the middle age satirists speak. The monk among Chaucer's "Canterbury Pilgrims" was prior of a cell, for we read that—

"When he rode, men might his bridel here
Gingeling in a whistling sound, as clere
And eke as loud, as doth the chapell belle
Ther as this tord was keeper of the celle."

The monk on whose intrigue "The Shipman's Tale" is founded, was probably the cellarer of his convent:—

"This noble monk, of which I you devise,
Hath of his abbot, as him list, licence;
Because he was a man of high prudence,
And eke an officer, out for to ride
To seen his granges and his bernies wide."

The abbot, too, sometimes gave licence to the monks to go and see their friends, or to pass a few days at one or other of the manors of the house for recreation; and sometimes he took a monk with him on his own journeys. In a MS. romance, in the British Museum (Add. 10,293, f. 11), is a representation of a monk with his hood on, journeying on horseback. We give here, from the St. Alban's Book (Nero, D. vii.), a cut of an abbot on horse-

AN ABBOT TRAVELLING.

back, with a hat over his hood; he is giving his benediction in return to the salute of some passing traveller.

The hermitages or anchorages which were dependent on a monastery, were not necessarily occupied by brethren of the monastery, but by any one desirous to embrace this mode of life whom the convent might choose. The monastery often supplied the hermit with the scanty fare which he needed; in a picture in the MS. romance, before quoted (Add. 10, 292, f. 98), is a representation of a knight-errant on horseback, conversing by the way with a clerk, who is carrying bread and wine to a hermitage.

The wood-cut with which we conclude, from the Harleian MS. 1527, represents the characteristic

BISHOP, ABBOT, AND CLERK.

costume of three orders of religions with whom we have been concerned—a bishop, an abbot, and a clerk.

THE ROYAL PICTURES.

THE CHILDREN OF CHARLES I.

Van Dyck, Painter.

J. Burnet, Engraver.

Size of the Picture 5 ft. by 4 ft. 4 in.

TITLES conferred upon the illustrious are honourable alike to the giver and the recipient, but they are soon lost sight of in the lapse of time, and the man who may have "borne his blushing honours thick upon him" is known to future ages only by the simple name which his genius redeemed from oblivion. Bacon, Nelson, Wellington, and many other great men, require no lordly title to tell the world who they were—neither does Rubens nor Van Dyck his prefix of knighthood as a mark of distinction.

Sir Anthony Van Dyck was born at Antwerp, in 1599. His father, to whom he owed his earliest instructions in drawing, is said to have been a glass-painter of Hertogenbosch; and some biographers state that his mother, who excelled as a painter of landscape, aided in the work of tuition. But his first master of any eminence was Van Balen, an artist of good reputation, with whom he remained two years, and at the expiration of that time, being then in his sixteenth year, Van Dyck became a pupil of Rubens, whose boldness of style, both in composition and colour, was more congenial to the genius of the young student than the delicate manner of Van Balen. He continued in the studio of Rubens five years, and then, by the advice of his preceptor, or, as some say (without, as we believe, sufficient grounds), instigated by the jealousy of Rubens, quitted him to pursue his studies in Italy.

During his six years residence in this land of Art, Van Dyck visited Venice, Genoa, Florence, and Rome. In the last-named city he was much patronised, and lived in great style. On his return to Antwerp, though he had already given good proof of his abilities in historical painting, he was compelled to have recourse to portraiture; but even in this he found fewer engagements than he anticipated, although the Prince of Orange invited him to the Hague, where he painted several portraits of illustrious personages attached to the court. He therefore quitted the country to try his fortune in Paris; but meeting with little success, once more returned to Holland, where, about this time, he heard of the encouragement which the English monarch, Charles I., was then affording to Art. Some of Van Dyck's biographers state that the king requested Sir Kenelm Digby, who had sat to the painter, to invite him to his court; others, that the Earl of Arundel, also a most liberal patron of the Arts, invited him to this country. However it may be, he came to England, was lodged by the king at Blackfriars, received the honour of knighthood soon after his arrival, and in the following year an annual pension of £200 was granted him for life. England, therefore, has a right to claim the merit of fostering and developing the genius of one of the greatest portrait-painters of his age, as she has the honour of holding his ashes. Van Dyck died in London, in 1641, and was buried in the cathedral of old St. Paul's.

Opportunity will be hereafter afforded when other engravings from the pictures of this artist are introduced,—and several are in preparation,—to comment upon the excellences of his style; for the present our observations must be limited to the work before us. The children of his patron, Charles I., who are here represented, are—Prince Charles, afterwards Charles II.; the Duke of York, afterwards James II.; and the Princess Mary, who married the Prince of Orange, and was the mother of William III. It is a beautiful picture in composition and colour—"the most original and the most charming," as Mrs. Jameson remarks, "of the numerous pictures of the same subject scattered through various collections." It was formerly in Buckingham Palace, and was taken thence to Windsor Castle, where it now hangs. Among the best duplicates of this painting, from the pencil of the artist,—and there are several,—are those respectively in the Royal Gallery of Dresden, in that of Turin, and in the possession of the Earl of Pembroke, at Wilton House.

The subject is well known to collectors of fine engravings by the prints executed by Sir Robert Strange, and by Le Blonde. There is also a fine lithograph of it by Haefstängel.

VAN DYCK.

THE THREE CHILDREN OF CHARLES 1ST
FROM THE PICTURE IN THE ROYAL COLLECTION

SCOTT AND SCOTLAND.*

THE "Lord of the Isles" forms the fourth volume of Scott's principal poems, which Messrs. A. and C. Black, of Edinburgh, have published as a richly illustrated "Christmas-book;" the former poems that have appeared in previous consecutive volumes being, the "Lady of the Lake," the "Lay of the Last Minstrel," and

"Marmion." Of the whole of these the courtesy of the publishers has enabled us to afford our readers an opportunity of testing the merits of the illustrations; the present page places before them examples of the wood-cuts introduced into the volume just issued, the "Lord of the Isles." The first we have selected opens on Canto 6: the view, it is presumed, taken in Stirling Castle, at the time referred to in the poem,—*"Beleaguered by King Robert's powers,"*—as the last stronghold, northward of the Tweed, retained by Edward II., but now reposing in peaceful serenity, and overlooking a country whose fields are laden with the golden grain. The second engraving shows Lord Ronald's fleet unmooring from Aros Bay, as described in Canto 1. The group of figures at the top of the page illustrates an incident in the cavern, when Bruce and Roland discover "the slender boy." The fourth

illustration represents Ronald and Dunvegan's chief in the presence of Bruce and his brother Edward, in the Castle of Astornish, at midnight, described in Canto 3.

* LORD OF THE ISLES. By SIR WALTER SCOTT, BART. With all his Introductions, and the Editor's Notes. Illustrated with Eighty Engravings on Wood, from Drawings by BIRKET FOSTER and JOHN GILBERT. Published by A. and C. BLACK, Edinburgh.

Scott's "Lord of the Isles" has not, we believe, been considered so interesting a poetical tale as the author's other poems of a similar character. "In so far as it is founded on historical truth," wrote Mr. Jeffrey, in the *Edinburgh Review*, "it seems to us objectionable, both for want of incident and want of variety and connection in the incidents that occur. There is a romantic grandeur, however, in the scenery, and a sort of savage greatness and rude antiquity in many of the characters and events which relieve the insipidity of the narrative,

and atones for many defects in the execution." The qualities pointed out by the reviewer we would regard as those which peculiarly adapt it for the pencil of the artist; and unquestionably Messrs. Gilbert and Foster have made a judicious selection from the numerous graphic scenes with which the poem abounds. As illustrations of the "savage greatness" of character alluded to by Jeffrey, we should point out two remarkably spirited designs by Gilbert—"Edith kneeling before De Argentine," and Bruce standing over the ruffian whom he has slain in

the cavern. A picturesque and "Turneresque" bit of landscape scenery is Foster's "Carriek Castle;" and the moonlight scene in the same Canto, the fifth; but we might occupy our page with references to the many beauties scattered throughout the volume. To remark that this edition of the "Lord of the Isles" surpasses "Marmion" and the others, would be saying too much; but it certainly equals any, and this is sufficient praise: unquestionably four volumes more exquisitely adorned with wood-cuts have never issued from the press.

THE DUTCH LANDSCAPE AND FLOWER-PAINTERS.

BY F. W. FAIRHOLT, F.S.A.

WITH ILLUSTRATIONS FROM ORIGINAL SKETCHES BY THE AUTHOR.

LANDSCAPE-PAINTING, as an independent art, is the youngest of the category. Beautiful as were the background views introduced into the works of the old painters, they were backgrounds merely, and secondary to the main intention of the picture. As an art self-reliant in its claims, it does not appear to have come boldly forth, and willing to stand on its own merits, before the close of the sixteenth century. It is to the artists of the Low Countries that we owe this now popular branch of Art. The landscape backgrounds of the early German and Flemish masters certainly originated the art, but it was the later painters of Holland who perfected its power. Appended to Kugler's remarks, in his "Handbook of Painting," that "Landscape, in the hands of Titian and Giorgione, sometimes assumed an independent character, and it is said that Titian was the first to treat it as a separate branch of Art," we have this note, by Sir Charles Eastlake—"Landscape-painting in Italy, however independent in its perfection, appears in its origin to have been indebted, in more than one instance, to a German influence. Vasari distinctly says that Titian kept some German landscape-painters in his house, and studied with them for some months. In Bologna it is probable that Denys Calvert, a Flemish artist, first excited the emulation of the Carracci, Domenichino, and others, who, in the end, formed so distinguished a school of landscape-painters. In both these instances a certain resemblance to the German manner, however differently modified by the character of the schools, is to be recognised, especially in the unembellished treatment of the foliage." It is impossible for any student of mediæval Art not to have been frequently struck by the great beauty of the landscape backgrounds introduced into the historic or religious pictures of that period. It is true that they are always conventionally treated, and rendered subservient to the ruling *motif* of the picture; but we cannot wonder that landscape should eventually assert its own sole power of charming, by the repose and beauty it imparts, even when used as a simple accessory. The works of Van Eyck, Memling, and Durer, frequently allow landscape to share at least one half of the attention of the spectator; and they appear to have intended this, to give a certain *air* to their compositions which would else be wanting. It was their avowed object to delineate great space, and they did this by invariably carrying the eye of the spectator to the extreme distance of the view by concentrating the light upon the horizon: nothing can exceed the brilliancy, beauty, clearness, and depth of space exhibited in these early works. It induced others of the school to go further, and make the figures in a historical or religious picture secondary to it; but it was not until the beginning of the seventeenth century that the grand conceptions of Poussin and Rubens gave entire independence to this branch of Art, and proved its innate power to command alone its own tribe of worshippers. The Dutch painters afterwards persevered in the new track until the triumph was complete.

The fantastic redundancy of details, the conventional forms of trees, and the equally conventional treatment of the general effect in very early landscapes by the artists of the Low Countries, were completely cast aside in the grander and truer works which resulted from the *ateliers* of Holland. Annibal Carracci had sometimes devoted himself to the delineation of the scenery of the Apennines; and contemporary with him there lived at Rome Paul Bril, who, born at Antwerp, combined the taste of his native school with that of the greater Italian. Suddenly, a series of landscape-painters appear upon the stage, and the early parts of the century saw the master-minds of Poussin and Rubens, joined by Claude, the most charming of all. He received his early training from the Fleming, Paul Bril; and one great trait of the early school is visible in his works—the love of repose, and the idea of air and space, given by condensing the light on the horizon, or in the extreme distance of the picture. The ideal beauty thus evolved in the works of these great men kept up and stimulated the school of landscape-

painters in the Low Countries, and contemporary with Claude and John Both, were Jacob Ruysdael, John Wynants, John Baptist Weenix, and his greater pupil, Nicholas Berghem, who were all occupied on landscape solely; while such master-minds as those of Cuypp and Potter made its beauties an integral part of their immortal works. Rembrandt had devoted his powerful genius to the display of effects hitherto undeveloped in the art, and the grandeur with which he invested a simple landscape by the aid of powerful *chiaro-oscuro*, and the study of storm and sunshine, as in his famous "Three Trees," vindicated the

art from a low level, and gave it a position that only the genius of our own great Turner could elevate.

This youngest daughter of the Arts, though unquestionably the favourite of the public, has been received by her sisters in some degree as an interloper, and her claim to equal sympathy denied. Surely this is unjust: is God's beautiful world less to be valued, or less worthy our study, than the world of man's passion? "Rocks, trees, mountains, plains, and waters," says Leslie, "are the features of landscape; but its expression is from above. The love of landscape is a love so pure that it can never

DUTCH TREES.

associate with the relishes of a mere voluptuary, and wherever such a love is native, it is the certain indication of a superior mind." Constable declared of one of Gainsborough's landscapes, "I cannot think of it, even now, without tears in my eyes." How many of Constable's pictures are redolent of all the freshness of earth's beauties! so fresh, so pure, that we may almost exclaim with Gray—

"I feel the gales that from yon blow
A momentary bliss bestow."

Any eulogy on Turner, whose pictures are poems

would be inappropriate here: an abler pen has enforced his claims to honour. We would merely remark that it is unbecoming in Englishmen, at any rate, to depreciate this lovely art—for, rivalled as we may be in other branches, in this the genius of English painters is acknowledged to be supreme.

In the pictures by Ruysdael there is a grandeur of composition and a boldness of treatment which belong to no other Dutch landscape-painter. He alone displays mountain scenery and foaming cataracts, which must have been idealisations in a great degree—he could not have studied the grand fea-

STREET IN HAARLEM.

tures he depicts in the monotony of his own land, which some authors assure us he never quitted. It has been conjectured that he rambled to Guelderland and Westphalia; but, allowing this, he must have exaggerated what he could see there, to produce the noble mountains and boldly-dashing waterfalls he delighted to depict.* He was born at

Haarlem in 1636, and was the son of a picture-frame-maker. Of a gloomy and reserved temper, he lived alone, and died poor in 1681; yet his works have a rare excellence. The idealism which invests his scenes is gloomily grand, worthy of

mind has been stimulated by the very opposite means that would ordinarily be supposed were used. Thus it is known of Guido that his most beautiful female heads were painted from a male colour-grinder, who is described as perfectly hideous, and whose features were transformed into a Magdalen, with the same *pose* and *chiaro-oscuro*, but with perfect beauty; the artist evidently using his model as a means of producing beauty by contrast alone.

* It has been asserted that Ruysdael constructed models to paint from, composed of small twigs and fractured stones, which he exaggerated into trees and mountains, and so composed his works. Such antagonisms might be doubted, had we not other instances where the artistie

the solitary man who lived only for his art, and saw only the severe or terrible features of nature. If he painted a native scene, which seldom occurred, it is invested with the mournful gloom of Holland, rather than with the happier features depicted by other artists. His pictures are to landscape-art what the Spanish school is to the French—vigorous and grand, but terrible. His scholars, Hobbema and De Vries, lose his gloom; but the former retains much of his grandeur, though devoted to less ambitious scenes.

Casting away all lugubrious views of his own country, Berghem delighted in representing simple nature in full joyousness. In this quality he differs from most masters of the Dutch school. He is the very reverse of his friend Ruysdael. The gloomy grandeur of his solitary and poetic mind impresses itself on the scenes he depicts; and you cannot study them without a feeling of "divine melancholy" creeping over the mind. Berghem, on the contrary, delights in bright skies, light clouds, and cheerful pastoral scenes. Unlike Ruysdael, he seeks not northern gloom, but rather southern sunshine. He was born at Haarlem in 1624, and was the son of Van Haarlem,* a painter of very moderate ability, who lived by delineating those pictures of still-life in which the Hollanders delighted. He had, however, excellent instruction from the artists who knew his father, and who liked the cheerful disposition of the son; and his uncle Weeuw, whose daughter he married, improved his tastes. He was intimate in the best part of his life with Wouvermans, Everdingen, Botb, and Ruysdael; and his time passed happily in the varied society of such friends. With them, or with nature, or else in delineating her better features in his own studio, he knew peace; but not with his wife, who was in disposition sordid, while the painter possessed the geniality of soul which beams forth on his canvas. It is related of her that she constantly spurred him to exertion, by knocking against the wall of his studio; and kept his earnings, that he might not indulge his taste for old prints. In the Chateau of Bentheim, where he resided, he had but to walk to the windows of his studio to gaze on green meadows, luxuriant trees, and cattle in every variety of grouping. Some writers affirm that he must have travelled to Italy; and could not have obtained by the aid of his own large collection of prints the ruins and temples he so well depicted in some of his works. They do not, however, sufficiently take into consideration the great constructiveness of some artistic minds—the way they comprehend one object through another. All Berghem's southern scenes are really translated into Dutch. His power of imitation is known to have been so great, that he could deceive connoisseurs by painting in the precise style of other artists.

He had many pupils, among whom the only happy hours of his life passed. Karel Dujardin is conjectured to have been one; but he certainly taught Peter de Hooze, Dirk Maas, and Artus Van der Neer. This latter artist delighted to paint the effects of evening and night. "A piece of water in a wood, surrounded by high dark trees; a lonely canal, whose tranquil surface reflects the light of the moon; a city in repose, steeped in the quiet moonlight—sometimes the calm peacefulness of night broken by the glaring light of a conflagration; these are the subjects which Van der Neer delighted to repeat in the most free and pleasing style; and with these he again and again rivets the eyes of the spectators."† In our National Gallery we possess a charming specimen of his power of conveying the peculiar effects of moonlight—an effect which could not be secured by sketching, and therefore argues a most retentive memory for the varied hues of nature.

There is another and a distinct class of students of nature whom the Dutch school originated—they who "represent what may be called the still-life of field-plants, under whose friendly shelter beetles and lizards, little birds, and snakes, pass their unheeded existence;"‡ or who depict the magnificent bouquets

in richly-sculptured vases, with which the rich merchant princes of Holland decorated their mansions; or else dispose of them in "most admired disorder, strewn upon a table, or entwined around a picture or bas-relief." John Breughel was one of the earliest artists who delighted in making pictures of these "stars of the earth;" and he was succeeded and outstripped by his scholar, Daniel Seghers, who first grouped their forms and colours into harmonious conjunction, and carried high principles of composition into his works. A peculiar poetic feeling also pervades the flower-painting of David de Heem; and from his atelier proceeded many excellent scholars, and among them some few ladies, to

whom the art has always presented charms. The most celebrated lady flower-painter was Rachel Ruysch, who flourished in the latter half of the seventeenth and beginning of the eighteenth century. At the same period lived John Van Huysum, whose flowers are said to want only perfume to make them real.

This celebrated artist was born at Amsterdam in 1682, and was the son of a house-decorator. The incidents of his life consist, as usual with Dutch artists, of the catalogue of his works. Between painting at home and visiting the flower-gardens of Haarlem, his days passed quietly away. He died in 1749, after having enjoyed great patronage for

DUTCH GARDEN, 1653.

his works, which were sold at a high rate, and were sought for by most of the European sovereigns and nobles.

The taste for decorative gardening and rare flowers was at this period carried to the greatest extent. Men would ruin themselves to possess a certain tulip-bulb: the records of no country produce parallels to the mania for flowers which once beset the Hollander. Haarlem was the grand centre of their growth, and thither came rich amateurs from all parts of Holland, as well as from distant countries.* The flower-gardens of this city are still famous, and hyacinth-bulbs are even now sent from thence to all parts of Europe. One of Captain Cook's com-

panions declared that when at sea, opposite the coast beyond Haarlem, when the wind set from the land, "through the placid atmosphere we could distinguish the balsamic odour of the hyacinth and other flowers." There can be no more beautiful sight than these Dutch gardens, with their glorious beds of flowers. The soil of Holland seems to suit their growth, and the brightness of their hues contrasts forcibly with the deep green of the trees and hedges. Wherever you travel in this country you see this love of pleasure-gardens; and over the decoration and "stock" large sums of money are expended. Rows of summer-houses, gay with the brightest colours line the canals, each inscribed

A MODERN DUTCH GARDEN.

with a name or motto, as "Rosenthal," "Jilienthal," &c., or "Lust en rust" (Pleasure and ease), "Niet zoo zwaayk" (Not so bad!), "Vriendschap en gezelschap" (Friendship and sociality), "Het vermaak is in't hovenieren" (There is pleasure in gardening), &c. Here the men smoke and the ladies knit, amusing themselves with looking out

on the passers-by. In front of its windows a canal or ditch stagnates, its waters only disturbed by the passage of a boat, or the plash of the enormous water-rats or frogs with which they abound. Thus, in the words of Beckford, "Every flower that wealth can purchase diffuses its perfume on one side; while every stench a canal can exhale poisons the air on the other." The gardens of the ancient châteaux of Holland were much more artistic than the modern: arcades were formed of clipped yews, or trained creepers, over trellisses supported by caryatides, as shown in our cut from a Dutch print dated 1653. Now they are generally quite square, bounded by clipped hedges, with every walk geometrically

* The name he is popularly known by is a *sobriquet*, which originated, it is said, in his escaping from the infliction of some chastisement from his father's house to that of the painter Van Goyen, who, fearful that the irritated parent should reach him, called to the inmates, *Berg hem* (or, hide him).

† Kugler's "Handbook of Painting."

‡ Idem.

* It is recorded that the anemone was first brought to England from a Dutch garden, whose proprietor was so chary of his flowers that on no consideration would he part with plant or seed. The visitor accordingly arrayed himself in a shaggy great coat, which brushed the seed from the plant in passing, and which was carefully gathered after his departure from the garden from the folds of the garment.

truc, and embellished with rows of stiff poplars, or square-cut trees at each angle, to complete the monotony; a fish-pond generally occupies the centre; or, if the garden be a small one, a small post is placed in the midst, supporting a large glass globe darkened inside, and which serves as a mirror to reflect the neighbourhood all around it. Trim box borders edge each parterre, which is religiously devoted to the display of one kind of flower alone, and nothing like a weed is to be seen anywhere. It would seem as if the constant care a Dutchman must bestow on his land, to protect it from destruction, and "make" the earth fit for produce, induced him to think all nature required his improving hand; hence the trees are mercilessly trimmed and cut, and the stranger in Haarlem is continually amused with the square and oblong masses of foliage which appear so compact upon the summits of the poles in front of the houses. These stems of the tortured plants are sometimes further improved (and the stranger more completely mystified), by being painted with the bright colours a Dutchman so delights in. These town-trees are most frequently trained over an iron trellis-work, to which each branch is affixed, like an espalier to an orchard-wall, and every straggling shoot or leaf lopped away. Sometimes, at a street corner, a naked stump supports a flat screen of verdure, which faces each angle of the house like a fire-screen. The trees most employed are the yew, the holly, and the box: here the patience of the gardener reaps a rich reward, and in process of time he can torture them into any form:—

"The suffering eye inverted nature sees,—
Trees cut to statues, statues thick as trees."

It would scarcely be imagined that so stolid a people as the Dutch would be carried away by an enthusiasm for flowers. Yet the annals of their tulip-mania, in the seventeenth century, are unequalled in the world. In 1635, the rage among the Dutch to possess them was so great, that the ordinary industry of the country was neglected, and the population, even to its lowest dregs, embarked in the tulip trade. As the mania increased prices augmented, until, in the year 1635, many persons were known to invest a fortune of 100,000 florins in the purchase of forty roots. One tulip, named Admiral Liefkin, was valued at 4400 florins; the rarest, named Semper Augustus, at 5500. At one period only two of these bulbs were in Holland, one at Amsterdam, the other at Haarlem; for the latter, twelve acres of building ground was offered; the former was purchased for 4600 florins, and a carriage and horses. Munting, a Dutch writer of the day, has written a folio on the rage, which now took the form of gambling, and regular marts for tulipsales were opened in all the principal towns of Holland; but, though large purchases were effected at enormous prices, the tulips did not really make part of the transaction: they represented but a gambling-medium, and ultimately the holders of the bulbs, who sold to realise their profits, found, when the *furor* had abated, that they represented no real property. Hundreds became ruined men, and it was many years before the country recovered from the miseries this gambling in flowers had produced.

By the aid of our topographic notes and sketches we hope to have made Holland better known to Englishmen. It is a country whose quaint peculiarities have no semblance elsewhere. Its features are unique, its people as national; its history one of the most exciting and glorious that can be offered to the student or the patriot. In its connection with the development of the great Reformation in the Church, or with the politics of our own country, it abounds in interest; and we hope to be the means of directing more attention thereto. It is somewhat singular that a country which offers so much to attract the attention of the educated tourist should be so little visited.

We now bid adieu to the Dutch painters. In the course of our remarks we have enforced the nature of their peculiar claims, and we need not here recount them. No school was more *realistic* in its tendencies, none honest in its truthful delineation of nature, or more capable of evolving the poetry in ordinary life. Spite of all prejudice they worked the mine well which they knew contained the gold, and though some of the dross may adhere to the metal, the gold is there in its native purity also.

THE DRESDEN GALLERY.

TRAVELLERS who may propose revisiting the capital of Saxony, will be gratified to learn that they will see the famous Dresden Collection under circumstances very much more favourable than ever it has been seen before. The collection is now placed in a new gallery, which has been built for its reception by the well-known Dresden architect, Semper; and visitors are now assisted to some knowledge of the collection by an excellent catalogue by Hübner, known as the decorator of the theatre, and by frescoes of great merit in Dresden. The old palace in which the collection has so long been exhibited, contained a distribution of rooms very like that of Marlborough House—a succession of apartments, with all kinds of cross lights rendering it impossible to see satisfactorily any of the pictures, except the small genre works, which were hung near the windows. It is at least remarkable that before the present there should have been no sufficient and reliable catalogue of a gallery so celebrated as that of Dresden; but this is not the only famous collection to which a catalogue has been wanting. Some years ago we inquired in vain for an official catalogue of the collections in the Palazzo Vecchio, and the Pitti, at Florence; but at that time there was no such thing, although in the libraries and record offices an ample and satisfactory history of every remarkable picture is deposited. To M. Hübner the state archives have been opened to assist him in the execution of his task; and the preface to the catalogue contains many interesting and curious revelations. We believe Hübner is a native of Saxony; were it otherwise he might have had some trouble in determining authorities written in old documents strictly according to the vernacular Saxon pronunciation—as "*Puhl*" for *Bol*; "*Hellprigl*" for *Höllenbreughel*; "*Ben*" for *Pesne*; "*Tenners*" for *Denner*, with a host of other similar agonising perversions. The history of the gallery is traced to its commencement, in that taste for the collection of curiosities which distinguished the "naïve" sixteenth and seventeenth centuries," among which were early distinguished a Venus by Titian, and two of the best works of Claude. The love of Art grew apace; and in little more than the third of a century (1743—78) the collection had acquired its most lustrous gems, and that celebrity which has ever since distinguished it. In 1743 it was enriched by the purchase of the Holbein Madonna, and in ten years after by the St. Sixtus Madonna; and about the same time by the famous works of Titian, Paul Veronese, Rubens, and Vandyke. The Dresden Vandykes, as a series, were the finest we had ever seen until we visited Petworth, where in quality and condition the Vandykes surpass all the productions we have had an opportunity of seeing by this master. In 1745 a hundred pictures were added from the Modenese Gallery, obtained from the Duke Francis of Este Modena, by purchase, for £26,821—a very inconsiderable sum, when it is remembered that in the number were comprised the six famous Correggios, as many Titians,—among which was "The Tribute Money,"—the same number of works by Paul Veronese, several Carraccis, and a number of pictures of the Bolognese school. The collection had its origin in the "Kunstammer," which was founded by the Elector Augustus I., in the year 1560, and received a number of curiosities which had been procured in the time of Frederick the Wise, and the Elector George, the "Bearded." Most of the works of Cranach, Dürer, and others of the earliest German masters, are conjectured, with probability, to have been acquired about this time; and the acquisition of some of the best of the earlier Italian pictures, declares, on the part of the Saxon princes, an established admiration of Italian Art. In time the collection gathered strength, inasmuch that the list of works in the year 1722 amounted to no less than 4708 in number, and from these arose the existing catalogue of 1938 pictures. The pictures were then placed in the old Stallgebäude, joining the palace; in 1744 they were removed to the Japanese Palace, but only to return to the Stallgebäude when that edifice was rendered more suitable for them. They remained there a hundred and nine years, and under that roof the gallery received some of its most remarkable additions. The masterpiece of Holbein is known to have been ori-

ginally painted for the burgomaster of Basle, Jacob Meyer; and when sold it was taken to Amsterdam, and passed in a short time into the hands of several persons. From Antwerp it travelled to Venice, and became the property of the Delfino family, by whom it was not much esteemed. The merit of the work was, however, recognised by Count Algarotti, who purchased it for the Dresden Gallery, two years after which the negotiations commenced relative to the Modenese pictures; and this was about the time that the new rooms were ready for the collection. Hübner gives an interesting account of the manner in which these negotiations were conducted. The correspondence was carried on in a cipher, in which all proper names were changed, so that it was impossible to know the persons or places that were mentioned. They were, for the most part, Italians who were employed by the elector to deal with the diplomacy of their countrymen. As the purchase of the Modenese pictures became known in Italy, there arose at once a just desire, on the part of their possessors, to dispose of masterpieces of Italian Art; and there were offered Raffaele's "St. Cecilia" for 15,000 ducats, besides the "Violin-player," and the "Foruarina," by the same master, as also Domenichino's famous "Diana and her Nymphs," and even the Polignio Madonna was offered by the nuns of the convent, but upon this occasion the emissary was only an obscure German artist, by whose want of tact the picture was lost. In 1748 a very considerable purchase was effected of works from the Imperial Gallery of Prague. This consisted of sixty-nine pictures of the Low Country schools, for which £4285 were paid. Notwithstanding the secrecy observed in the conduct of these purchases, the fact was known at Vienna, and the emperor mentioned certain works which he wished to be reserved from purchase "at the very lowest price." Among these was the "Picture Gallery" of Teniers; but yet among the pictures acquired for the Dresden Gallery there were some admirable works—as Vandyke's "Charles I.," Rubens's "Boar Hunt," and others of equal quality. In 1750 the purchase of the copy of Raffaele's "St. Cecilia" was effected, and the "Predella," by Ercole Grandi; and in 1752 "Ninus and Semiramis," by Guido; and in the following year the gallery received its most precious treasure—the St. Sixtus Madonna, which was obtained through the Bolognese painter, Giovanni, for 20,000 ducats and a copy of the picture.

After this, the imposing altar-piece of Bagnacavallo was purchased, in 1755, for 300 Hungarian ducats, from the convent of the Pellegrini, at Bologna, and this was the last of these incomparable acquisitions; for, shortly after the king, who had so much distinguished himself by his taste for Fine Art, died, from which time no considerable additions were made to the gallery until the Spanish works were purchased from the collection of the late King Louis Philippe. Whatever may be wanting to the special and intrinsic interest of the works themselves, is amply supplied by the narrative of the manner in which they have been added to the collection. In very many cases, the elimination of certain facts establishes beyond dispute the authenticity of pictures which, simply from appearances, have been ascribed to painters by whom they have not been executed; for instance, the copy of Raffaele's "St. Cecilia" has been always understood to have been made by Giulio Romano, whereas it has been proved to have been painted by Denys Calvert, called by the Italians Dionysio Fiammingho. We doubt not that in every gallery there are numerous works falsely attributed; we believe such cases are numerous in the Louvre, and especially in collections of early formation. Hübner also proves a portrait attributed to Holbein to be a work of Meinling—a portrait of Antony of Burgundy, son of Philip the Good. The picture was like the work of Holbein, and it was accordingly attributed to him. Although there was little beyond similarity of manner in favour of the decision, there was nothing to disprove it until Hübner proved the authorship of the work—not by any judgment or critical argument, but by incontrovertible written evidence.

The information contained in this catalogue will enhance the value of their collection in the estimation of the citizens of Dresden, and, in the eyes of foreigners, will invest it with a double interest.

POETICAL AND ARTISTIC
CONCEPTIONS OF DEATH.

THE various forms under which Death has been represented in the mythology of different countries, in poetry and popular superstition, afford a subject of highly-interesting comparison and research—one branch of psychological investigation. In the earliest mythology of Northern Europe, as well as of Greece, the extinction of life, the transition of the spirit from this world to another, was assigned to the guardianship of a supernatural power—one of the inferior class of deities. The most poetical representative of these beings was the goddess Hali, Halja, Hellia, or Hel, as she is variously called, whose character and offices first invite our attention.

The goddess Hel, according to the Eddaic poems, was the daughter of Loki, and a giantess. She is represented as either black, or half black and half human-coloured, and her dwelling is in the depths of the earth, under the root of the celebrated tree Yggdrasil, in the cold, cheerless, and shadowy realm of Niflheim; there she holds her court; her dish is named *hugr*, and her knife *sultr*—words of synonymous import, expressing in the most poetical manner her insatiable appetite, a feature which we shall afterwards observe under various forms. This goddess was originally no destructive power; she was not regarded as the agent of killing; and her office was merely to preside over her abode in the lower world, where she received the spirits of the departed; she neither goes herself, nor sends any messenger to fetch them. The dead are left to enter on the long and dark journey by themselves, and they take with them all the various necessities for travelling, such as shoes, money, servants, horses, clothes, &c.; some ride, others drive; and large troops of souls journey in company—"fara till Heljar," or "travel to Haljar." Properly speaking, only those who die of old age, or from natural causes, are received by Halja—all who are fortunate enough to be slain in battle being transported to Valhalla (the hall of Odinn), by the Wælkryian. In two of the finest songs in the Edda we have a description of this journey to the nether world.

Dr. Grimm notices that, in some of the popular Danish legends, Hel is represented as riding about on a three-legged horse, to announce pestilence and sickness; or, according to a more ancient interpretation, to collect and carry off the dead who had fallen to her lot: a chariot was afterwards added, in which she drove about the country. This view is evidently of a popular character, and the offices of the goddess are here much less dignified than those ascribed to her in the Edda, which reminds us of the Mater Tellus, or Mater Terra (Mother Earth) of the Italian mythology, who received the dead into her bosom—a beautiful and poetical idea, which has been perpetuated down to the present day.*

Besides Halja, there were other deities who had power over the souls of the departed, one of the principal of whom was Rân, the sea-goddess, who is described as drawing the bodies of all who have been drowned into her abode with a *net*: her name signifies to seize, or carry off. There appears to be a tendency common to the mythologies of most countries, to multiply in the progress of time the objects of worship and veneration. The simplest form of faith is generally the most ancient, and the present subject affords an illustration of this remark. It moreover deserves notice that the further we retrace the monuments of Northern mythology, the more refined, benign, and divine does the character of Halja appear: none of the ideas of cruelty, sadness, or terror which arose in after ages attach to her. She is one of the oldest representatives of Paganism, and Grimm notices her correspondence with a Hindoo goddess, who is also represented black, and has power over the souls of the dead. It is interesting to observe a trace of this ancient belief handed down, like so many similar ones, in the popular stories of Germany, where a representative of Halja appears in the form of Mother Holle, who figures repeatedly as a kind of witch.

The goddess Hel, or Halja, has a representative in the Hades, or Pluto, of the Greeks, the Oreus,

Ditis, or Dis, of the old Latin religion—the deity presiding over Erebus. It is remarkable that the terms Hades and Oreus were, by the ancient Greek and Latin writers, used only to denote persons, deities; and that the application of them to the idea of a *place* did not come into use until a comparatively late period. In the New Testament, also, Hades occurs several times in this sense. But another curious fact is, that our own word "hell" is merely a similar transformation of the pagan goddess who presided over the dead, into the abode of the dead itself. The place of punishment, in the Northern mythology, filled with poisonous serpents, darkness, cold, and gloom, was "Nastrond," answering to our idea of hell. Christianity admitted no goddess of death, and in the conception of a hideous place of punishment, the Anglo-Saxons united the realm of Hel with Nastrond. "The prevailing idea in the infernal regions of the Teuton," observes Mr. Kemble, "is cold and gloom. Fire was too cheerful in the North to be sufficiently an object of terror: it appeared otherwise in the East, where coolness is the greatest of luxuries. The poisonous snakes which, waking or sleeping, seem ever to have haunted the Anglo-Saxon, formed a convenient point of junction between his own traditional hell, and that which he heard in quotations from the works of the Fathers; and to these and their influence alone can it be attributed, when we find flames, and sulphur, and all the hideous apparatus of Judaic tradition adopted by him. In this fact seems to lie a very important mark of ancient heathendom." Mr. Kemble quotes the following description of hell from the "Salomon and Saturn" on the defeat of the rebel angels, it is said that God—

"For them made hell,
A dwelling deadly cold,
With winter covered:
Water he sent in,
And snake-dwellings,
Many a foul beast
With horns of iron;
Bloody eagles,
And pale adders;
Thirst and hunger,
And fierce conflict,
Mighty terror,
Joylessness!"*

The converted heathens readily applied the name "hell" to the under world, or receptacle of the wicked after death, and this notion has continued from the earliest times to the present day.

In these various characters, however, we observe no personification of the idea of Death, but the genuine pagan notion of a deity presiding over the dead; and similarly, in this change of a person into a place, we have merely the removal of the heathen deity, and the substitution of a figurative place—an abode; and, as we shall see at a still later period, of the state or condition of the dead.

A remarkable feature in the notion entertained by the ancients respecting Death is, as we have remarked, that she is not regarded in the light of a destroying being, but simply as the messenger of a god, whose office it was to convey to him the souls of the departed. The destructive powers were distinct—sickness, famine, and the sword. This character, or form of Death, as a messenger or angel, pervades the Northern mythology; but, although of true Pagan origin, it reappears both in the Jewish and Christian Scriptures, as, for instance, in the angels who carried the beggar into Abraham's bosom (Luke xvi. 22). Under the Christian form, the office of messenger became twofold,—that of the angels, who transported the souls of the pious, and that of the devils, who carried off those of the wicked. This idea, it is scarcely necessary to observe, furnished a rich and favourite subject to the early artists both of Italy and Germany.

In the early Greek poets—in Hesiod and Homer—Thanatos, or Death, is represented as the twin-brother of Sleep, the sons of Night, whose abode is in the under world. But here Thanatos appears as a messenger, as for instance in the Iliad, xvi. 676, &c., where, after Sarpedon has fallen by the hands of Patroclus, Apollo washes his body in the stream, anoints it with ambrosia, and clothing it in ambrosial garments, commits it to the twin-brothers Sleep and Death, to convey to Lycia, to be interred there by his friends. This office of Thanatos, therefore, corresponds to that we have remarked in the

Northern mythology; and with it we must also connect the office of the Wælkryian, the female messengers, whom Odinn sends to fetch and convey to his heaven the spirits of those heroes who were slain in battle.

In one of the fables of Æsop, Thanatos, or Death, who generally appears as a kind of protecting Genius, is invoked by the old man to relieve him from his toils. And it may be observed that, like all the spirits of the other world, Thanatos is always ready and at hand to obey a summons.

We have seen that, in the Northern mythology, both Halja and the Wælkryian* are represented in the female character. The Greeks, it is true, assigned to Hades a queen consort, Persephone; but she was a mere adjunct to the officiating monarch; and in the old Latin mythology she has no counterpart. In the works of Art too of ancient Rome, Grimm observes, "Death is never represented as female, although we may observe the Latin name *Mors* is feminine." In the Grecian mythology, Hermes performed the office of conducting the spirits of the dead to the realm of Hades; although, Thanatos also officiates as this messenger. In Euripides' drama of "Alcestis," for instance, Thanatos is introduced as a priest or messenger of Hades, coming to fetch away the heroine. Mr. Keightley remarks, that we here "meet the first mention of a remarkable notion of the Greeks—the dead seem to have been regarded in the light of victims offered to Hades; and as it was the custom, in commencing a sacrifice, to pluck some hairs from the forehead of the victim, and burn them on the altar, so Death is here represented as coming to cut off a lock of the hair of Alcestis." On a vase depicted in Dennis's "Etruria," is a representation of the so-called parting of Admetos and Alcestis, with two hideous figures, one on each side, armed the one with a serpent, and the other with a knife: these appear to typify Death.

It is doubtful whether the Etruscan Mantus may be regarded as a representation of Hades, or of Death. On an Etruscan vase we have seen him depicted armed with his hammer, with large wings, and with *talaria*, or wings, on his heels; he is bald, with the exception of a tuft of hair on his forehead. We have been struck accidentally by the curious resemblance between this figure and that of Satan, in Giotto's "Life of Job," in the Campo Santo, who has similar wings, the tuft of hair, and what appear to be *talaria*. If the figure on the vase to which we refer be a representation of Death, the introduction of the hammer is curious. Sin (or Satan) and Death have frequently been confounded in pictorial representation; and the Devil, as Grimm remarks, was from early times compared to two implements—the hammer, and the bolt or bar. The former instrument is clearly connected with Thor's celebrated hammer, and Grimm quotes many instances where the early Fathers of the Church (Jerome, Gregory, &c.) use the name of *Malleus* and *Vectis* for the Devil.

By the later Greek and Latin poets, Death is depicted as a sad and terrific being, although the artists of Greece gave him a more pleasing aspect—frequently in the character of Genii holding an inverted torch, or slumbering youths; but these are rather to be classed with symbolic types than personifications, which we purpose here chiefly to consider. Many, indeed, are the curious symbolical notions connected with Death which have appeared among various peoples and in different ages. The celebrated Mastersinger Hans Sachs represents Death as pushing away the stool from under a person, and letting him fall. Another very common figure is, that of Death extinguishing the light (of life), which appears in Germany as well as in the Grecian Genii with an inverted torch. The mild and beneficent character of Death, early prevalent in Germany, is exemplified in the notion of his being an intimate companion and friend. A pretty legend tells of a subterranean cavern, in which burned thousands and thousands of lights, in endless rows: these are the lives of men,—some shining in large tapers, and others burnt down to a small eud; but there is always danger of a long taper falling or being overturned. In the same fable, it is said that Death once stood godfather to a poor man, whom he

* Mater Terra was represented as a goddess drawn by lions. See Macrobius, lib. i. ch. 21.

* Sal. Sat. p. 173.

* Saxo Grammaticus calls the Wælkryian *femine nympha sylvestres*.

gifted with the power of seeing him bodily when he approached a sick person, and of knowing, from his position, whether the patient would recover or die. The godson became a doctor, and grew rich. When Death appeared standing at the head of a sick person's bed, the patient was his; but if Death stood at the foot of the bed, the sick man recovered. Once, however, the doctor turned the body of a sick man round, and outwitted Death, who, to revenge himself, at last upset, as if accidentally, the light of his godson.

A beautiful old Northern Saga represents Death sitting before the door, waiting till the souls of the inmates go out, to carry them off to the other world. Another conception of frequent occurrence is, that the souls of the dead are led away by Death bound as prisoners—a notion which agrees with the Hindoo mythology.

The office of a friendly messenger, which was originally assigned to Death in the Northern mythology, became gradually converted into one of a severe and cruel nature. He is represented under various characters (such as a thief, a Fowler, a fisherman, &c.), as an enemy who seeks to steal away the souls of the dead, and who wrestles with mortals, or rather with the principle of life, which idea lies at the bottom of this fiction. In this strife Death was represented as the leader of a large host, which is constantly increasing.

In Germany, the mediæval conceptions of Death figured a greedy and insatiable *Hölle*—an *Orcus esuriens*, or devouring ogre; and she is represented with a yawning maw, like a ravenous wolf. In the old poems, there is frequent mention of the abyss and the gates of Hel, *Hölle*: and two passages in the Bible refer to similar images:—"Hell and destruction are never full" (Prov. xxvii. 20); and, Isa. v. 14—"Hell hath enlarged herself, and opened her mouth without measure."

"As far as we can judge," says Mr. Kemble, "from the descriptions which survive, the Anglo-Saxons represented Hell as a close and covered dwelling—a prison duly secured by locks, bolts, and bars. But the popular fancy had probably even then adopted the notion of a monstrous beast, whose mouth was the entrance to the place of torment. From this peculiar feature, however, we may believe that a remembrance still lurked among our forefathers of the gigantic or Titanic character of the ancient goddess, who, in Norse mythology, was Loki's daughter."

To recur to the goddess Hel: in the beautiful legend of Baldr, whose death afflicted all the gods, we find Odin descending to the abode of Hel, in hopes of persuading the goddess of the dead to relinquish her prey. "He was successful, and returned with the joyful tidings that Baldr would be restored to the gods, if all created Nature would weep for him. All Nature did weep for the loss of the god of beauty, save one old crone. When called upon to do her part in his restoration, she answered, 'What have the gods done for me that I should weep for Baldr? Let Hel keep her dead!' Thus Baldr's fate was sealed; his throne was placed in the shadowy realm of Hel, and weeping virgins spread the eternal pall that was to give dreary honour to the god of light in the cold kingdom of darkness and the invisible."*

One peculiar representation of Death we must not omit to notice—that of a figure riding on horseback. The description of Death on the Pale Horse, in the Revelations, will naturally occur to the reader; but Dr. Grimm traces this peculiarity to a heathen origin, and cites references to the superstition in popular sayings and tradition: he reminds us also that the Wælkýrian rode on horseback, and that Odinn rides, whilst Thor goes on foot or drives. In some Danish legends given by Thiele, when a person recovers from sickness he says, "*Jeg gav Døden en skiøppe hærre*," i.e., "I gave Death a bushel of oats" (for his horse). In the "Dance of Death," preserved at Lubeck, Death is depicted riding on a lion. In connection with this conception of Death on horseback, we may, by the way, remind the reader of Bürger's celebrated ballad of "Lenore," where Death carries her off in the form of her lover.

From the transitoriness of life being likened in the Scriptures to grass and flowers, Death was naturally converted into a mower, and in this character

the scythe, knife, and sickle, are assigned to him. A fine old German song says—

"Ist ein Schmitter heisst der Tod,
Hat Gewalt vom höchsten Gott;
Heut wetzt er das Messer,
Es schneidet schon viel besser—
Hüte dich, schönes Blümlein!"

This character of Death corresponds with that of Time; but it does not belong to the earliest class of personifications.

In the poetical conceptions prevalent among the ancients of the strife of Summer and Winter, the latter is often represented by Death, with which many curious popular superstitions and customs in Germany are connected.

In the Hindoo theology we meet with a direct personification of Death—or the god of death—Yumu, a remarkable character. An account of Yumu is given in one of the Vedas (*Kut'h-ôpunishud*), of which the following is an outline. A youth named Nuchiketa, having offended his father, the latter surrendered him to Yumu. The youth went to the dwelling of Yumu, who was absent, and Nuchiketa remained there three days and nights without food. When Yumu returns, he is addressed by his family in these words—"A Brahmin entering a house as a guest is like fire; good householders, therefore, extinguish his anger by offering him water, a seat, and food. Do thou, O Yumu! present him water." Yumu, being thus admonished by his family, approached Nuchiketa, and said to him, "As thou, O Brahmin, hast lived in my house a revered guest, for the space of three days and nights without food, I offer thee reverence in atonement, so that bliss may attend me: ask three favours of me as a recompense for what thou hast suffered while dwelling in my house." Nuchiketa then made this as his first request, saying, "Let, O Yumu! my father's apprehensions of my death be removed, and let him recognise me on my return, after having been set free by thee. This is the first of three favours which I ask of thee."

This Yumu promised to grant. Nuchiketa then made his second request.

"In heaven, where there is no fear whatsoever, and where even thou, O Yumu! canst not always exercise thy authority, and where therefore none dread thy power, the soul unmolested by sorrow enjoys gratification. As thou, O Yumu! dost possess knowledge, respecting fire, which is the means of attaining heaven, do thou instruct me in that knowledge."

This Yumu promises to grant. Then Nuchiketa asks, as his third request, Yumu to explain to him the question respecting the nature of the soul after man's death. Yumu replies, "Even gods have doubted and disputed on this subject, which can never be thoroughly comprehended. Ask, O Nuchiketa! another favour instead of this." Yumu then promises to grant him every kind of worldly power and enjoyment; but Nuchiketa refuses all this, and persists in his request, which Yumu, finding him worthy of such knowledge, at length grants; after which, "having thus acquired this divine doctrine, imparted by the god of death, with everything belonging to it, Nuchiketa, freed from the consequences of good or evil acts, and from mortality, was absorbed into God; and whatever person also can acquire that knowledge, shall obtain absorption."*

In conclusion of the above brief remarks on Death, we may note what appears to be the natural sequence of the popular poetical conception—first, the earliest and rudest form—that of simple personification; the second, or artistic form, that of symbols, embodying the poetry of Art; and thirdly, the latest form, that of emblem. We cannot pass unnoticed, the grandest personifications of Death met with in any poet—our own Milton. The wonderful descriptions of Sin, and her offspring Death, given in the "Paradise Lost," are too numerous to be more than alluded to here. Milton has exercised in these personifications his greatest powers of imagery, and the reader will find an interest in studying them again, in connection with the subject of this article. How grand is the picture of Sin and Death sitting guardians at the portals of Hell!

* Ramohun Roy's translation of the "*Kut'h-ôpunishud*," of the Ujoor-Ved.

"Before the gates there sat,
On either side, a formidable shape:
The one seem'd woman to the waist, and fair;
But ended foul, in many a scaly fold,
Voluminous and vast," &c.

Then the magnificent description of Death:—

"The other shape,
If shape it might be call'd that shape had none
Distinguishable in member, joint, or limb;
Or substance might be call'd that shadow seem'd,
For each seem'd either; black it stood as night,
Fierce as ten Furies, terrible as Hell,
And shook a dreadful dart; what seem'd his head
The likeness of a kingly crown had on."

Again, where Sin describes the birth of Death:—

"But he, my inbred enemy,
Forth issued, brandishing his fatal dart,
Made to destroy! I fled, and cried out Death!
Hell trembled at the hideous name, and sigh'd
From all her caves, and back resounded Death!"

In the tenth book also are given other pictures of these wonderful creations of the poet, which embody many of the figures prevalent in the middle ages, to which we have alluded, and which are here grandly illustrated.

Symbolic allusions to Death, under various forms, were very common in the early works of Art in Greece and Rome; direct personification was rarely met with, and we shall here allude to one only, of an interesting character. Petrarch, in his poem, "The Triumph of Death," gives a fine personification of Death, under the figure of an old woman. The whole poem is a perfect picture, and we cannot resist translating a few of the introductory verses. Madonna Laura is returning from her victory over Love (described in the preceding poem):—

"This beautiful and ever-glorious fair,
A naked spirit now, and loosed from earth,
That erst the lofty prop of virtue was,
Returned now with honour from the strife,
Joyful, for she had tamed the powerful foe
Who conquers with his arts the world entire.
Nor other arms had she than a chaste heart,
With beauteous features and with sorrowing thoughts,
With wise discourse, the friend of honesty."

* * * * *
The beauteous dame, and that fair company,
Her chosen band, from noble victory
Returning, joined in a goodly troop.
Bright stars they seem'd, and in the midst a sun,
That lightened all, yet dazzled not the sight,
With roses and with violets encrown'd;
As gentle heart draws honour to itself,
So came that gleeful company along."

The reader will mark the abrupt transition, and the manner in which this introduction deepens by contrast the colour of the following pictures:—

"When sudden I beheld a banner dark,
A female form, rolled up in sable vest,
Move onward with a storm—such that I doubt
Flegra e'er saw, time was the Giant's war."

Again, the fine description of the realm of Death:—

"She spake, and lo! in its wide circuit round,
The plain was all encompass'd thick with dead,
That neither prose nor verse can comprehend."

* * * * *
There too were those who were accounted blest,
Pontiffs and reigning princes, emperors:
Now are they naked, poor, and mendicant."

We quote these lines in connection with a celebrated work of Art borrowed from them—Oreagna's fresco of the "Triumph of Death," in the Campo Santo at Pisa. The artist unquestionably took his theme from Petrarch, and indeed has followed his description so closely as to overstep the just limits of his art—a fault pardonable in an age when the *spirit* of poetry was infused alike into the different branches of Art, and the laws which should regulate its *form* or expression were comparatively little studied or understood. Oreagna's hideous figure of Death, with streaming hair, and claws, bat's wings, and wire-woven vest, conveys nothing but a burlesque of the picture which the poet's few but forcible lines suggest.

The most direct personification of Death remains to be noticed—that class of pictorial representation known by the name of the "Dance of Death." The subject is highly interesting, and we shall probably treat of it in a future article, to which the present one may form an appropriate introduction.

* See Kemble's "Saxons in England," vol. i. p. 368.

SUGGESTIONS OF SUBJECT
TO THE STUDENT IN ART.*

BY AN OLD TRAVELLER.

CHAPTER XI.

Labour and evermore Labour—Success to the Valiant—An Exception—The Wherefore—A Portrait of mournful Histories—Look before you leap—Buonamico and his Master—Oration to a Neighbour—The Artist required—A new Professor—Bishop Guido disappointed—German reverence for Shakspeare—Portia to Bassanio—The Wedding of Petruchio—Shylock and Antonio—Ferdinand and Miranda—Repetitions of Pietro Perugino—Favourites of the Tuscan and Umbrian Masters—St. Francis Seraphicus—Santa Theresa—SS. Cosmo and Damiano—The Eremite Fathers—St. Hilarion—St. Efreim—St. Gualfardo—Santa Sofronia—Themes from Hebrew Scripture—The Vatican—The Uffizj—The Pitti—Bologna—Sienna—Gallery of the Florentine Academy—Modern Works—The four greater Prophets—Denunciation—The City restored—Ezekiel by the River—The Prophet waiting—Prayer of the Four Children.

NEVER does the excellent Vasari fail to mark with his best approval the progress of that artist who combines the habits of laborious industry with the attributes of a heaven-sent genius. To Francesco Francia, to Domenico Ghirlandajo, to Andrea Mantegna, to his own connection, Luca Signorelli, to Domenico Puligo, and to some few more, all of high distinction, has the admirable biographer accorded the—from him—exalted praise of thoughtful endeavour and studious application.

That these qualities were also exhibited by the great Masaccio, and by others whose names stand forth most prominently in the scrolls whereon Art's noblest stand inscribed, we all know. Leonardo da Vinci, at whose name all reverently lift the covering from their brows, looked ever favourably on the student evincing them; and though exempt by his miraculous endowments from such necessities as attach themselves, in the form of conditions, to the success of the less-richly endowed,—a category wherein all but one other master in Art (the divine Raphael himself, namely) must needs be comprised,—he was yet unusually patient of labour; and when we consider the perfection attained by him in pursuits, each demanding more than the total life of a gifted man, it becomes manifest that not even his brilliant versatility could have raised him to the eminence he gained in so many walks, had not his student-life been more than commonly earnest and laborious.

And to the steady worker, accordingly, it is, that Fortune, no less than the judgment of the world, as expressed by the Biographers, has awarded the palm of success. Some few exceptions there are to sadden us, and among them it has ever appeared to the present writer that Raffaellino del Garbo is one of the most melancholy. As a student, he gave evidence of the very best qualities; "held in the highest esteem among artists," says Vasari,† "insomuch that his master, Filippo,‡ considered Raffaellino to be in some respects a much better painter than himself;" nay, even at a later period, the same unimpeachable authority says of him, after enumerating his various excellences—"from all which the artists formed such flattering expectations of him, that he was long considered to be the first among the younger painters of his time."

How then did it chance that it is of this same Raffaellino we read the melancholy remarks that follow? Vasari has just completed the enumeration of admirable works performed by the artist in question, when suddenly he breaks forth after this fashion:—

"But his manner now deteriorated from day to day. Nor do I know to what cause we are to attribute this misfortune, for the poor Raffaellino could not have lost his power and the knowledge of his art; neither did he cease to be careful and industrious. Yet all availed him nothing." * * * * * And further, when speaking of a still later period—"It was with Raffaellino as though, feeling himself to have degenerated, he had become ashamed of himself, and felt disheartened—remembering the high expectations formed of him in his youth, and conscious of the great difference between his later performances and the works so admirably executed in his earlier days. Thus suffering, and becoming old before his

time (Raffaellino died at fifty!) he declined more and more, departing to such an extent from the excellence of his first manner, that the works he produced no longer seemed to be by his own hand: daily forgetting some portion of his art, he descended at length from the ordinary frescoes and oil-paintings of his profession, to paint every kind of thing, even the meanest." * * * * * "In this state of things all his distinction in Art finally disappeared, and his practice became debased to coarseness: sunk into the extreme of poverty, Raffaellino del Garbo miserably finished his life at the age of fifty, when he was buried by the brotherhood of the Misericordia."

And now what explication shall be given of this strange and mournful phenomenon?

I reply by another question:—Have you seen the portrait of this master, painted after a design made by his disciple, Bastiano da Monte Carlo? one of the many distinguished artists reared under his auspices—Bronzino being one of them. If you have, and have well considered its expression, I believe you will agree with me as to that I am about to offer. My theory is, that Raffaellino married an inferior wife; and if you recall the expression of that face, you must, I think, feel assured that no blight of life less complete, and less absolute, could have withered the soul of the artist to the condition you read there. What despair is in those eyes! What heavy hopelessness on all those features! Where is the consciousness of success, that should have kept its seal on that fine brow? It has been driven thence by that other and bitter consciousness; he has degenerated—he is degenerating. The burning pain of that destructive thought has graven its own dreary characters where the light of genius should have remained all brightly, and the ruin is such that you feel it to be final—there is no hope of redemption: you gaze sadly, and with increase of sorrow, until the lines turn indistinct, because your eyes have become surcharged with tears. You depart from the melancholy portrait saddened for the living day; and when you next approach it, more sorrowful than ever is the desolate aspect you meet. All the long and grievous history of our hapless Raffaellino's wrecked existence seems revealed in that mournful gaze; you comprehend it all, and you sympathise with all—but so full of grief are the weary details that you do not endure to dwell thereon, and you reveal them to none.

Confirmation, if any were required, of this unhappy conviction is but too amply given in the words of Vasari himself: among others to that effect he has the following:—"This artist was truly unfortunate in his connections, being constantly surrounded by people of mean habits and very low degree." And further—"Raffaellino studied drawing so industriously that there still remains a vast number of excellent designs by his hand, although his sons are ever ready to sell them for the meanest price, and to any purchaser."

Now the excellent Giorgio was not himself of so "mean habit" as to speak thus of a man's connections simply for being poor, or of humble rank: they were consequently worse than poor and humble. Then, I ask you, would any sons worthy of their once-distinguished father have proceeded in such sort as to bring on themselves the reproach implied in the words of Vasari just given? and would the sons of a mother worthy to have been the companion of the man our lost and much-lamented Raffaellino was, not have proved incapable of meriting such? Without doubt they would, and my position is established. His unhappy choice in marriage was the bane of Raffaellino del Garbo—wherefore, I shall e'en borrow for this occasion the grave words of the learned, and, involving my trivial proportions in the doctoral robe, shall say—*Verbum sapientiae satis est*. Look twice ere once ye marry, O ye men of nature's highest orders!

In the Gallery of the Academy at Florence is a short series of designs, attributed to an artist of career and character altogether different—Buonamico Buffalmacco, namely—to him "or his disciples;" and I incline to believe them by the disciples, since they have all the character proper to him who should take upon him to delineate the myriad pranks of that laughter-loving Florentine. Some of these have already been alluded to very slightly in a preceding chapter. The details are as follow:—Andrea Tafi, Buonamico's master, aroused

his ire in boyhood by awaking him nightly, hours before the dawn, and setting him incontinently to his work. You now behold the consequences to Andrea.

From an ill-swept cellar, Buffalmacco has collected some thirty beetles; he has fastened to the back of each a tiny taper, and lighting these, has sent the creatures into his master's chamber by favour of a cleft beneath the door. Here the beetles are disporting themselves, to the inexpressible terror of Tafi, whom the lights they bear just enable you to see, half-rising from his low pallet, and gazing on the spectacle with pallid face. From the curtained window of a neighbouring apartment, which commands the sleeping-room of his master, you furthermore discern, carefully peeping, the delighted visage of Buffalmacco, fully enjoying the success of his scheme, which did in fact avail for a time to frighten Andrea from that inconvenient habit of arousing his disciples before daybreak—Buonamico persuading him that those demons had appeared to avenge themselves on him for his pictures of Saints then painted, and affirming that over night-work only did they possess any power of control.

You have next an act of retribution, similar in spirit and intent, but differing in the place and manner. We are still in the fair city of Florence, but no longer in the studios of Andrea Tafi. The dwelling before us is that of a Florentine citizen "of the meaner sort," a certain "weaver of wool" on whom his neighbours had imposed the name of "Capodoca," or "Goose-head." Compelling his wife to spin yarn for his use, and keeping her at her labours through the greater part of the night, Capodoca thus disturbed the rest of Buffalmacco, now himself a master, and having his abode in close contiguity to that of the weaver, wherein you now see him engaged in making an oration, with all the gossips of the neighbourhood for his auditory.

And the cause of that assemblage is on this wise. Wearied by the perpetual hum of the spinning-wheel, Buffalmacco has avenged himself on Capodoca by contriving a cavity in the wall of his bedroom, immediately over the hearth of the weaver: into this he inserts a long tube, filled with salt, and, choosing a moment when the wife of Goose-head, making soup for the consolation of her husband, has turned her attention elsewhere, he pours the contents of this contrivance as often as he thinks meet into the good woman's pot. This has now occurred so frequently, that the Goosehead's patience is exhausted, and he has been correcting his wife after a fashion but rarely approved by such as bear that name. Soundly beaten, she has roused the neighbourhood by her cries; and here is Buffalmacco defending her, as it is well his part to do.

"Faith, comrade," says he, "you should be a little more reasonable. You complain that your dish is too much salted; but I marvel, for my part, that your good wife can see her way to the pot at all, or do any other thing that is right. Here do you keep her, spending the best of her night at the spinning-wheel: let her go to her rest at a reasonable hour, and you'll see that she'll then have her wits about her, and not make blunders of this sort."*

The neighbours of this Goosehead agree with the painter; her husband is compelled to the same conviction, will he, nill he: the poor woman regains her natural rest; the artist likewise remains undisturbed, and every one "lives happily for ever after."

Passing through Arezzo in the year 1302, Buffalmacco was invited by the prince-bishop of that city, Guido, namely, to paint a chapel which then occupied the site where the Baptistry now stands in the episcopal church.

That work the artist had nearly completed, when a very curious circumstance occurred, and this, according to Sacchetti, was as follows:—"The bishop had a great ape of extraordinary cunning, the most sportive and mischievous creature in the world: this animal sometimes stood on the scaffold, watching the painter at his work, and giving a grave attention to the whole process. One Saturday evening, Buffalmacco left his colours, and on the Sunday, our ape, though encumbered by a log of wood, fixed on him to prevent his leaping about, contrived to get on the scaffold. Here he seized

* Continued from p. 330.

† See Vasari, "Lives of the Artists" (English edition), vol. ii., p. 473, *et seq.*

‡ Filippino, that is to say, the son of Fra Filippo Lippi.

* See Vasari, *ut supra*, vol. i. (English edition) p. 157.

each vase of colour in turn, mingled all together, as he had seen the painter mingling his materials, and plunging the pencils into this mixture, he daubed over every figure, and did not cease from his labours until he had repainted the entire work to his own liking; that done, he departed at his pleasure.

"When Monday morning came, Buonamico returned to his work; but finding his figures ruined, his vessels all heaped together, and everything lying in strange confusion, he stood amazed in sore dismay. Arriving at length at the conclusion that some jealous Aretine had worked him this woe, he bore his plaint to the bishop, who was much disturbed; but, consoling Buffalmacco as he best might, persuaded him to renew his labours; and the mischief was repaired.

"But the bishop now gave him six soldiers, who were commanded to keep guard with drawn swords in the absence of the painter, and to cut down without mercy any man whom they might detect in the act of defacing the pictures.

"One day these men heard a strange rolling sound approach them, immediately after which they saw the ape clamber up to the scaffold, and seize the pencils. In the twinkling of an eye the new master had mingled his colours, and the soldiers beheld him set to work on the figures of Buffalmacco.

"They quickly summoned the artist, and showed him the malefactor, when they all stood watching the animal at his operations, although scarcely able to do so because they were in danger of fainting with laughter. Nor could Buonamico refrain from joining them, and, though much displeased by what had happened, he laughed until the tears ran down his cheeks.

"At length he betook himself to the bishop, and said—

"My lord, you desire to have your chapel painted in a certain fashion; but the manner thereof does not please your ape, who is therefore painting it after a manner of his own."

"He then related the story, adding, 'There was no need for your lordship to send to foreign parts for a painter, since you had the master in your house; but perhaps he did not know exactly how to mix the colours; however, since he is now acquainted with the method, he can proceed without further help. I am no longer required, seeing that we have his talents, but, with your lordship's permission, may return to Florence.'

The bishop, heartily vexed as he was, could not restrain his laughter, and laughed the more because he remembered that the artist thus tricked by an ape was himself the most incorrigible of jesters. When they had talked and laughed over this new occurrence to their hearts' content, the painter went to work for the third time, and the chapel was happily completed.

That done, Bishop Guido set Buonamico to paint on one of the walls of his palace an eagle on the back of a lion, which the bird had killed. But the lion being among the insignia of Florence, and the eagle that of Arezzo, the artist resolved to do the work after his own fashion: he caused a screen to be constructed around the scaffold, and then, painting a lion occupied in tearing an eagle to pieces, he departed to Florence, pretending to require certain colours which demanded that journey.

The bishop was furious when the affront put upon him was discovered; but the artist was ultimately forgiven. Some of the commentators on this passage in the life of Buffalmacco, tell us that Bishop Guido, being a Ghibelline, intended to affront the Guelfs, rather than the Florentines, by the work in question.

The admiration—or rather the reverence, the adoration—of the great and thoughtful German people for Shakspeare, is well known to all who have consorted intimately with our Teutonic kinsmen; and the following passage, among many others, has more than once been cited as one eminently worthy of attention from the student in Art,—he will remember that it is Portia who speaks:—

"I pray you tarry, pause a day or two
Before you hazard, for in choosing wrong
I lose your company; therefore forbear awhile.
There's something tells me (but it is not love)

I would not lose you; and you know yourself
Hate counsels not in such a quality.
But lest you should not understand me well
(And yet a maiden hath no tongue but thought),
I would detain you here some month or two
Before you venture for me.*

Turn also to the words addressed by Portia to Bassanio, when he has chosen aright, and admit that both these passages are suggestive of exquisite pictures. Nay, he who shall faithfully render the fair being of Portia—that refined and beautiful head—that noble, yet graceful, and most feminine form—the winning sweetness of her attitude—the eloquent loveliness of her sweet lips, as she gives utterance to the god-like poet's words,—he who shall give us all this, I say, will endow the world of Art with such a form and face as its truest lovers are ever seeking, and may sometimes behold in their dreams, but do not often meet on canvas or in marble. Look to it, then, ye who aspire to be Sculptors or Painters; and if you produce only this one Portia of Shakspeare, as Shakspeare made her, the world to come shall admit that you have lived to a worthy purpose.

Wholly different in manner, but presenting pictures equally vivid, and in all respects equally perfect in their kind, are the lines that follow. They are taken from the second scene in the third act of the "Taming of the Shrew." Gremio, one of the suitors to Bianca, the sister of Katharine, has just returned from the wedding of the latter, and is describing the events of the ceremony to the disguised servant, Traudio, whom he takes for his master, Lucentio. It is Gremio then who speaks:—

Gre.—Tut! she's a lamb, a dove—a fool to him.
I'll tell you, Sir Lucentio. When the priest
Should ask if Katharine should be his wife,
"Aye, by Gog's wounds!" quoth he, and swore so loud
That, all amazed, the priest let fall his book,
And, as he stooped again to take it up,
The mad-brained bridegroom took him such a cuff,
That down fell priest and book, and book and priest.
"Now take them up," quoth he, "if any list."

Tra.—What said the wench when he arose again?
Gre.—Trembled and shook;—for why, he stamped and swore

As if the vicar meant to cozen him.
But, after many ceremonies done,
He calls for wine. "A health," quoth he—as if
He had been aboard, carousing to his mates
After a storm—quaffed off the muscadell,†
And threw the sops all in the sexton's face,
Having no other reason
But that his beard grew thin and hungerly,
And seemed to ask him sops as he was drinking.
This done, he took the bride about the neck,
And kissed her lips with such a clamorous smack,
That at the parting all the church did echo.
I, seeing this, came thence, for very shame;
And after me I know the rout is coming.
Such a mad marriage never was before.
Hark! hark! I hear the minstrels.

The lines that follow have, in like manner, been proposed as a subject for the pencil, by German lovers of Shakspeare, to the artists of that nation. The place is a public square in Venice; the principal group consists of Shylock and Bassanio, who are joined by Antonio—Bassanio speaks:—

Bass.—This is Senior Antonio.

Shy. (aside).—How like a fawning publican he looks!
I hate him, for he is a Christian;
But more for that, in low simplicity,
He lends out money gratis, and brings down
The rate of usance here with us in Venice.
If I can catch him once upon the hip
I will feed fat the ancient grudge I bear him.
He hates our sacred nation; and he rails
Even there where merchants most do congregate,
On me, my bargains, and my well-won thrift,
Which he calls interest. Cursed be my tribe,
If I forgive him.‡

Of the dialogue between Ferdinand and Miranda highly effective expositions have come under our notice. Kaulbach has one in his "Illustrations to Shakspeare;" and a cartoon, based on the following words, was commenced by one of his countrymen for the annual exhibition of a northern capital, in the year 1852, but was not finished in time to appear. It may perhaps have done so in the following year; but as respects this the writer has no information.

The portion of the words needful to our present purpose are these:—

* "Merchant of Venice."

† Wine was at that time presented to the company immediately after the rite was performed.

‡ "Merchant of Venice," Act i.

Mir.—If you will sit down
I'll bear your logs the while—pray give me that,
I'll carry it to the pile.

Per.—No, precious creature;
I had rather crack my sinews, break my back,
Than you should such dishonour undergo,
While I sit lazy by.

Mir.—It would become me
As well as it does you; and I should do it
With much more ease, for my goodwill is to it,
And yours against.

Pros. (concealed in the distance).—Poor worm! thou
art infected—
This visitation shows it.*

Frequent reproach was incurred by Pietro Perugino, during the latter years of his life, for that he constantly reproduced the figures which had before appeared in his works. This happened more particularly on a certain occasion, when the Servite monks of Florence had commissioned Pietro to paint that picture for their high-altar, which had been commenced by Filippo Lippi, after Leonardo da Vinci, to whom it had first been offered, had departed for France, and which had been left unfinished when Filippo died.

Nay, when the work was uncovered, all complained of this repetition, whereupon Pietro defended himself in the lame manner that follows:—

"I have here painted you the figures that you formerly commended. They then pleased you well, and if they now displease you, so that you no longer extol them, what can I do?"

The reply was manifestly, "You can choose others." But our poor Pietro, discouraged just then by the fact that "the greatness of the name he had formerly acquired began now to be obscured by others—that of his illustrious disciple among the first,"—discouraged by this, I say, he had not energy for new efforts, and the reproaches thus recorded were one of the results.

But others of his day might very justly have shared that odium with him, since, if they did not reproduce exactly the same figures, it is certain that they walked in a very narrow circle of subjects, and frequently came round to the one but lately treated. Hence the numerous St. Sebastians, that weary their admirers of all succeeding ages in every gallery—to say nothing of Holy Families, the mere distinctive titles whereof would make a long catalogue. Next in frequency comes St. Christopher, more particularly among the Tuscan and Umbrian masters—these last delighting, moreover, in pictures of cities, &c., taking shelter beneath the mantle of the Virgin; then follow St. Francis Seraphims, receiving the stigmata, and Santa Theresa in ecstasy—both frequently found among the works of the Italian painters. SS. Cosmo and Damiano are in like manner favourite subjects with the early painters. Few but will remember the example by Biceci di Loreuzzo, and now in the Uffizj, where these holy physicians are in the act of replacing the amputated leg of a white patient by that of a dead negro, whose corpse, deprived of the member required, is lying near. This is the picture painted for Antonio Ghezzi della Casa, in the year 1430—consequently, during the life-time of the painter's renowned father, Lorenzo di Biceci, who lived until 1452. The work was subsequently suspended on a pilaster of the Florentine cathedral, where it remained until 1842, when it was removed to the first corridor of the Uffizj, where it now remains, as above said. Neither will it be needful to remind our readers of a work on the same subject, left us by Fra Giovanni Angelico da Piesole, now in the gallery of the Florentine Academy, with a companion picture—the story of five martyrs—also to be found there.

No objection needs to be taken to these subjects—certainly not; in themselves they are wholly unobjectionable: it is but of their too frequent repetition that the beholder becomes weary, and if, from these—of somewhat kindred character—that follow, it shall please any student to select two, three, or more, let him feel secure from all fear of the reproaches showered on Perugino, as to a too oft-repeated story—always provided that he do not give us the self-same figures in all his paintings, as that excellent master was ultimately charged with doing.

St. Hilarion, the founder of the hermit-life in Syria, as was his master, St. Anthony, in the Theban deserts, is not unworthy of the painter's attention.

* "Tempest," Act iii.

Clothed in skins, and in the flower of his age, he is represented with a dragon beside him, in allusion to the legend setting forth his victory over a creature of the dragon kind, by the extension of the cross, which the anchorite holds in his hand, or has leaning against the side of a dark and low-browed sandy cave, within the shade of which he is most commonly found seated.

There is another Syrian hermit, St. Efram, or Ephraim, whose death, which took place in the Asturias, about the year 378 A.D., is delineated in a Byzantine picture of the eleventh century, still in the *Museo Cristiano* of the Vatican. The saint is surrounded by monks, with whom are certain of the poor, about to be left desolate by his departure, and bewailing their loss; in the background are scenes from hermit-life, depicted with much truth and force: this work bears the name of Emanuel Tzanfurnari—a painter not, at present, otherwise known to the present writer.

St. Nicholas von der Flue exhorting his compatriots to peace, at the moment when the freedom of all Switzerland was in danger of destruction from their discords, is a subject entirely worthy of memorial; it is interesting, and has the further merit of being in strict conformity with historical truth—that event having taken place in the town-house of Stanz, as most readers will remember, during the year 1481.

A second interior will be well bestowed if you devote it to Santo Gualfardo, the patron of saddlers, whom it would ill become us, in this, our land of good horsemen, to leave entirely out of view. You are to paint him in the midst of his work, as that was conducted in his day—the early part of the twelfth century, and in the city of Verona, where it was that he exercised his craft, and ultimately died. This last event we may suppose to be not far distant, since there is a stone coffin descending towards him from the clouds, and now appearing to him through the open front of his booth, as he kneels in grateful adoration to receive it. This announcement of, and preparation for, his proximate departure, was sent to Santo Gualfardo, says the legend, in recognition of his sanctity, and was seen in its passage through the air by all Verona. Many of the citizens are, in fact, regarding the coffin with varying expressions, while others are gazing on the saint with infinite reverence and amazement.

Santa Sofronia, also of the eremite body, supplies us with a picture not unlike, in its details, to one which makes the closing scene of that ancient story, "The Babes in the Wood." In the desert—but a desert in name only, since the landscape is one of exquisite beauty—we have the holy woman prepared for death. She has pillowed her head on a fragment of rock, the cross is beside her, and all around are birds, each bearing in his mouth a portion of that leafy covering wherein they have already well-nigh enveloped her whole form, or else departing in search of material for the continuation of their pious office. Three young girls are kneeling at some distance, having been arrested by wonder and awe at the spectacle before them, when arrived thus far on a visit of duty to the saint: older persons, men and women, may vary your picture; these you may deal with as you like: but for them you can have but the warrant of your imagination—all previously given is part and parcel of the authorised, if we are not to say the authentic, legend.

The "Worship of the Lamb," an altar-piece, by the brothers Van Eyck, with its wings on either side, representing the long train of eremite fathers, from Paulus Eremita and St. Anthony downwards, will be fresh in the recollection of our readers. Mary Magdalen, and St. Mary of Egypt, although not always enumerated among the anchorites, likewise appear in this work, as having passed each a large part of her life in the wilderness. The landscape is remarkable for its period, and many of the heads—some of those belonging to the older men more particularly—are full of the most life-like truth and force of expression.

There is a picture of John the Baptist—the great forerunner of all anchorites—in the Pinacothek of Munich, which has been attributed by writers generally to Hugo Van der Goes;* but this is declared by Dr. Waagen to be an error, and Hans Memling is by many good judges considered to be the more

probable author of the work. Of the St. John by Raphael, in the Tribune of the Uffizi, at Florence, none will need to be reminded. A picture of Mary Magdalene, by the townsman of Raphael, Timoteo della Vite, forms one of the glories of Bologna, and is in all respects admirable; the beautiful head bends with a touching grace, and the long flowing hair, falling to the feet of the saint, renders the mantle given her by the painter well-nigh superfluous. St. Paulus Eremita, and St. Anthony in the desert, painted by Lucas von Leyden, and now in the Lichtenstein Gallery, at Vienna, is also a work of merit. Many others, treating the same interesting series of subjects, return to the memory as these are recalled, but must for the present remain without notice.

It has ever been matter of surprise to the present writer that the greater masters did not more frequently devote themselves to themes from the older Scriptures: I say the greater masters, because it does not appear to me that any other could attempt them without incurring the charge of reprehensible presumption. In my present office I have but rarely specified such, partly because the habits of daily life in our country bring that richest of treasures—for the artist whose aims are of the highest—constantly before his eyes, but chiefly because it is given to few, even of Art's most favoured sons, to approach that sanctuary; nor to them, save only at moments recurring at distant intervals, and but rarely accorded.

And so must it have been felt at all times; we cannot doubt it. Remembering well the instances of selection from the Hebrew Scriptures by the ancient masters—seeing one work after another rise to the eyes of memory, and omitting none, yet do we find them at points so widely distant, as compared with others, that we are justified in describing them as rare and few. As compared with subjects chosen from the lives of the Saviour and the Virgin, for example, or from those of the Evangelists and Apostles, or of the Saints of the Canon, how do they count? Pass in memory through any gallery you may please to select, and the result will be found as here stated. Then how narrow is the range of subjects; a few scenes from the lives of David, the first Patriarchs, or from one or two of the Judges, or from that of Judith, and we have named all. It is as if none, finally, ventured to look at these themes save through the eyes of the bolder adventurers preceding them.

Take, for example, the thirty-six or thirty-seven paintings constituting the gallery of the Vatican,* and say what you there find in disproof of what is here asserted.

The great Florentine Gallery of the Uffizi has some few: but these do but prove the rule, for amidst the vast numbers of that immense collection, how small, nay almost imperceptible, is this fragment. We have Esther before Abasuerus, by Paolo Veronese; Giorgione has taken Moses and Solomon for his themes; Jacopo da Empoli has a sacrifice of Abraham; Botticelli and Allori give us scenes from the lives of Joseph and Judith; while Vasari, a master who rarely has justice done him, ventures on the less hacknied subject of Elisha's miracle of the bitter herbs.

In the Pitti Palace is a vision of Ezekiel, from the pencil of Raphael himself; but not in all the large gallery of Bologna do I recall a work on the subjects in question by the greater masters,—with the sole exception of a Samson, by Guido, who shows us the great enemy of the Philistines, triumphant from their slaughter, and causing water to flow from that jaw-bone of the ass, which has been his instrument. There is a St. Michael trampling the Demon, by Innocenzio da Imola, but this cannot be treated as coming strictly within the category we are now considering.

Nor do examples abound in the public gallery of Sienna, which comprises works from early in the 15th till towards the close of the 16th century. Francesco da Giorgio and Leandro—or perhaps, Francesco—da Ponte (Bassano), have pictures, I

* Our readers will remember that the pride of the Vatican, as to extent, is in its many gorgeous halls of sculpture; but—and what a but!—the small picture gallery boasts the "Transfiguration" and the "Last Communion," to say nothing of all beside.

think, from the lives of Susannah and Joseph respectively, but I remember no more. Prophets and saints, used as adjuncts to the lives of Christ and the Virgin, of course excepted: these abounding here as elsewhere.

In the profoundly interesting gallery of the Florentine Academy we have again but few examples among the older masters; in the exhibition of artists belonging to the day they have appeared in larger proportion. Laban seeking his lost idols, and Dalilah shredding the locks of Samson, are among them, both by Crescentino Roti; these are productions of some four or five and twenty years since.

The four greater prophets have been of late years chosen as themes for their study by German artists. They appear in a fresco, painted by Heinrich Hess, in the Allerheiligenkirche, at Munich; and in the Ludwigskirche, of the same city, there is a group of these prophets by Cornelius. Kaulbach's "Destruction of Jerusalem" exhibits them also: they appear in the clouds above the doomed city; and as an instance of a work from one of the greater prophets, all will remember the "Belshazzar's Feast" of our own compatriot. Themes yet untouched remain, nevertheless, and that in rich abundance, for him who feels himself permitted to approach the sublime source: and here, taken from the first among them, in order as in place, is a passage from Isaiah, grandly rendered by a young Venetian artist, whose cartoons did not proceed beyond the first design: the denunciation conveyed in the words, which will be found in the margin, was therefore never painted. In the same portfolio was an illustration of words from Jeremiah,* all unlike the ordinary tenor of that prophet's works, but the picture was none the less effective for that, and well merited completion. The words will be found below.† From Ezekiel an attempt was made to show the prophet waiting by the river Chebar, as set forth in the earliest verses of the book; but "the great cloud," and "the fire infolding itself," and "the brightness about it," with the powerfully sketched figure of Ezekiel himself proceeding from the mass of "the captives," were all unfinished: what should come of an effort so ambitious it were thus not easy to determine; but it could scarcely be in the intention of the student to venture on more than a part of the vision. From the contemporary of Ezekiel—the prophet Daniel—the four children entreating to be "proved with pulse to eat and water to drink,"‡ rather than with "the daily provision of the king's meat, and of the wine which he drank," assigned to them, was the subject chosen; nor, so far as the cartoon had proceeded at the period to which we refer, was it likely to prove unsuccessful.

* Isa. c. xxix. :—"1. Woe to Ariel, to Ariel, the city where David dwelt! add ye year to year; let them kill sacrifices."

"2. Yet I will distress Ariel, and there shall be heaviness and sorrow: * * *

"7. And the multitude of all the nations that fight against Ariel, even all that fight against her and her munition, and that distress her, shall be as a dream of a night vision."

† Jer. c. xxxiii. :—"10. Thus saith the Lord: Again there shall be heard in this place, which ye say shall be desolate without man and without beast, even in the cities of Judah, and in the streets of Jerusalem, that are desolate, without man, and without inhabitant, and without beast,

"11. The voice of joy, and the voice of gladness, the voice of the bridegroom, and the voice of the bride, the voice of them that shall say, Praise the Lord of hosts: for the Lord is good; for his mercy endureth for ever: and of them that shall bring the sacrifice of praise into the house of the Lord. For I will cause to return the captivity of the land, as at the first, saith the Lord."

"12. Thus saith the Lord of hosts: Again in this place, which is desolate without man and without beast, and in all the cities thereof, shall be an habitation of shepherds causing their flocks to lie down."

"13. In the cities of the mountains, in the cities of the vale, and in the cities of the south, and in the land of Benjamin, and in the places about Jerusalem, and in the cities of Judah, shall the flocks pass again under the hands of him that telleth them, saith the Lord."

"16. In those days shall Judah be saved, and Jerusalem shall dwell safely: * * *

"17. For thus saith the Lord: David shall never want a man to sit upon the throne of the house of Israel."

‡ Dan. c. i. v. 4—12.

* This work bears the date of 1472.

EXPENDITURE ON PUBLIC WORKS
IN LONDON AND PARIS.

THERE is as yet no sign of the proposed extension of the buildings accessory to the Houses of Parliament, according to the plan of Sir Charles Barry. The south side of Bridge Street is still standing, and St. Margaret's Church yet occupies its ancient site. Parliament may not coincide with the architect, but we agree with the late Sir William Molesworth, that the removal of the south side of Bridge Street, at least, is indispensable. There are many reasons wherefore it may be inexpedient at present to carry out the estimates of the architect—among which the immediate necessity for new government offices may not be the least pressing. We cannot be accused of proceeding indeliberately with any of our public works—we have nothing, therefore, to expiate on that score. But, were it otherwise, it is not intelligible to us that any dissipation in public buildings could, by causes either immediate or contingent, imperil our government. It is not so in France. Our neighbours have possessed themselves of the lamp of the Eastern tale, and have secured the services of the most wonder-working of all the geni, who, in the spirit of true enchantment, turns their most sordid dwellings into luxurious palaces. But these are the transformations which sow discontent among the masses: so long as the new edifices were national, it was well; but the erection of sumptuous private dwellings excludes them from the *beaux quartiers*—they feel themselves slighted; they who, in their time, have more than once been the law—the enthroned people; and theirs is now the voice that suggests to the French Government that they have attempted too much in a time too limited. Were we to commit a similar extravagance, the results could not be identical. This was seen when the homes of twenty thousand of the lowest classes were swept away in St. Giles's and Clerkenwell, and almost of an equal number in Westminster. There was no care as to their future abiding-places, nobody asked whither they went; but it was soon discovered that the worst of them had migrated, and translated with themselves their pandemonium to the purlieus of Lisson Grove, where they acquired for their locality a name at which even Milton and Dante shuddered; the descriptions, however, of the latter apply to the translation from St. Giles's, for there—

"D'anime nude vidi molte gregge
Che piangean tutte assai miseramente,
E parca posto lor diversa legge."

Thus, the dislocation of fifty thousand of the labouring, or, what is worse, of those classes that live without apparent means or occupation, has no result; but in France, every movement by which the lowest classes are in anywise effected becomes at once an event of political importance. Our neighbours would have unhesitatingly adopted such propositions as those of Sir Charles Barry without due provision. We are justified in saying this because they have done that which is to them much more perilous. It would almost appear that between Paris and London there is a rivalry as to the embellishment of the court quarter; but, in a comparison of the two cities, we cannot join in the general depreciation of our capital. The enrichment of the best quarter of Paris may be said to be almost concluded, but in London nothing has been commenced but the Houses of Parliament; and if but a half of the designs which of late have been so thoroughly ventilated, be carried into effect, we shall have no reason to shrink from comparison with Paris. With regard to the additional works considered by Sir Charles Barry necessary to the completion of the New Palace at Westminster, he has proposed that New Palace Yard should be inclosed on the north and west sides, and should form a part of the New Palace, as it had done of the Old Palace; that the principal entrance for the public should be at the north-west corner of this proposed new quadrangle. The new building forming the west side of this quadrangle is proposed to be continued southward until it joins the existing building at St. Stephen's Porch, thereby forming a façade to the new street, to be called St. Margaret's Street, and Old Palace Yard, with the convenience of a covered footway throughout the entire extent of it. Such an addition would undoubtedly rectify the

irregular and disjointed character of the present building, as viewed from the west and north-west; and a degree of unity would be thus acquired such as the river-front presents. Such a disposition would be a means of distinguishing the principal entrance by a prominent feature; and the effect of these additions would also be to appropriate to useful purposes the waste but valuable space which now contributes in nowise either to the ornamentation or good effect of the Palace. The purposes for which these erections might be useful would be, extra committee-rooms, if any number beyond those in the existing building should be required, and again as public offices, or for commissions formed for assisting the legislation of the country;—and it must be observed that accommodation of this kind is frequently and suddenly wanted, and when so required can only be obtained by the hire of some small, inconvenient, and perhaps distant private residence. The proposed additions, with their cost, are as follows:—Building on the south side of New Palace Yard, £67,295; building at the west side of New Palace Yard, including the entrance gateway, £79,052; building forming the centre of the front towards St. Margaret's Street, and southwards to St. Stephen's Porch, £102,594; building in the proposed new quadrangle of New Palace Yard, west of Westminster Hall, £13,993; the Speaker's stables, &c., £3266; alterations of the front of Westminster Hall, £12,085—giving a total of £278,285. This estimate does not include the purchase of the block of houses on the south side of Bridge Street, which must be removed should these proposed additions be adopted. The cost of these houses, together with compensation to tenants in occupation, is estimated at £170,000. These houses are in another direction an obstruction, as, while they stand, it is impossible to obtain a good passage to Westminster Bridge. In this estimate of £278,285 there is no provision for the law courts, which must be removed from Westminster Hall, and not one fourth of the accommodation necessary for these courts would be found in the erections contemplated in this estimate. In addition to these buildings a committee of the House of Commons has recommended the removal of St. Margaret's Church, which, if these plans be realised, would be highly desirable, for it is not necessary to show how much this edifice would be obtruded on the proper site of the Houses of Parliament. For this church a site has been proposed by Sir Charles Barry between Prince's Street and Tothill Street, the purchase of which would cost £45,000, and the removal of the church is calculated at £23,000. Sir Charles Barry has also recommended the raising of the roof of Westminster Hall, at a cost of £25,000, and the enlargement of Old Palace Yard for the purpose of obtaining space opposite the Victoria Tower—an improvement which could be effected only at a cost of £110,000—a very considerable outlay for the sake of effect; but when we remember that on the Continent, and even in our own country, many of the most splendid architectural essays are obscured by old and ruinous houses of the worst taste, inasmuch that the effect which, under other circumstances, would be really imposing, is entirely destroyed, we cannot wonder at the desire of the architect to secure for his work the advantage of its being seen. The total estimated cost of these additional works would be £651,285, and the entire cost of finishing the whole in accordance with these plans would be considerably upwards of two millions and a half—not, all things considered, an extravagant sum for erections of such importance, contributed throughout a period approaching twenty years, which must be the space before the whole could be effected. Our school of economists have long exclaimed against what they call the profane waste of public money in public building; they cannot exclaim against the sums expended in what the times and the progress of society render a necessity—Art embellishment, that has for two years been all but suspended. Let us see what within a few years our neighbours have expended in building. In 1850 the amount expended in building was £880,000; during the five following years the cost of building amounted to the enormous sum of £28,440,000; and during the present year the estimates are for £10,000,000; and nearly all this for Paris alone. Grievances are all comparative; when we consider the position of the French nation at this moment, it will scarcely excite

surprise that such things should be, after a little better than profitless expenditure of nearly forty millions sterling in six years. What comparison can be instituted between our expenditure of two or three millions, and that of forty millions on the part of our neighbours in one third of the time? We would not seem wise in the discussion of *faits accomplis*, but it has been foreseen that such marvellous outlay in public building must involve the French government in, to say the least, embarrassment. This it was that brought the war to a conclusion when we were only preparing to carry it on. Our economy is our strength, but the embellishment of Paris is the weakness of France; and the worst of her difficulty is that she dares not suddenly stop these public works. It is sincerely to be desired that to the French Government money may be the only cost of the embellishment of Paris.

CORRESPONDENCE

FROM THE

UNITED STATES.

THE SUMMER LIFE OF THE ARTISTS.

DEAR SIR,—Now, as wintry days are coming, and the artists are returning from country rambles to city homes, it may not be inappropriate for me, lingering still amidst the autumn glories of the great hills, to tell you something of our summer life, its whereabouts, and its ways.

I take up the tale *con amore*, as you may well suppose, desiring no better success than to win you to even a small share of my own interest therein; for pleasure more pure, simple, and sincere than that of the glad artist, set free with the summer sunshine, to wander as fancy pleases over the hills and far away, is nowhere to be found.

I cannot, perhaps, do better than glance hastily first at the actors in my drama, the artists themselves, their numbers and quality; next, at the stage upon which they are to play, its character and capacity; and then at the action, its pleasures and its pains, its methods and its results.

Landscape art is yet in its youth in America; though a youth of health and vigour, and brilliant in promise, its short life scarcely looks back through one generation. A quarter of a century ago it did not exist at all; and until within a very few years past, its progress has depended alone upon the labours of the three gifted men—Cole, Durand, and Doughty; in whose genius its vitality was first seen and felt. Recently many others, worthy to wear the mantles of these fathers of the art, have sprung up to assist and to continue their toils, and to share their honours; while others again will surely come in their turn, until the present clear promise of high success shall be gloriously performed.

Happily, nowhere is that great hope of modern landscape art, the general and growing practice of patient, earnest, humble, out-of-door study, more reasonably entertained than amongst us. In this spirit we began, and have ever continued our career—impelled by the lack of other sources of instruction, in the absence of all Art-examples, and yet more by the requisition made by the *morale* of people and painter alike, for the "plain, unvarnished tale" of nature's truths.

With the earliest breath of returning summer, then, all our landscapeists are lured from their studios to out-of-door study—not in mere superficial memoranda of the forms and colours of nature, but in ever-patient delineation of her minutest charms, and upon canvas which an easel is required to support. So great is the number of these pilgrims that at the high-altars of nature their presence and their companionship is fast growing to be, in the estimation of the summer tourists, one of the chief features of observation and enjoyment.

Whether the traits (coming now to the second point of my discourse) of our American scenery are more or less acceptable and serviceable to the painter than are those of the Old World landscape, it is not in my mood, if in my power, to inquire at this time; though, if we must confess to an inferiority in some qualities and characteristics, it will be with the consoling remembrance of many compensating advantages. We should like to see here,

sometimes, the pretty, joyous, rural sentiment of your English homes—though we can content ourselves with the rude pioneer's cabin, stoutly subduing the wild forest, and bearing the rose of civilisation to the soil of the wilderness. There is beauty, to be loved in the picturesque surprises of the wayward and Art-embellished *physique* of nature on "the Continent;" but to our feeling there is a higher and nobler charm in the youthful freshness and the luxuriant verdure of our grand mountain solitudes, in the promised wealth and plenty of our vast prairies and tropical savannas, and in the bold floods of our interminable rivers and our sea-like lakes.

Such as it is (and it quite contents us), we have plenty of material within the varied area of the three thousand miles which lie between our Atlantic and our Pacific coasts. We have, indeed, a field rather too extended for our peace of mind as artists; and it is with us quite a task for the previous winter to determine where the next summer shall be passed—though the force of habit and of example, the ease of access, and the assurance of reward, generally lead the greater number, season after season, to a few well-tried, well approved, and convenient localities.

Most of our general resorts are in the vicinity of the northern cities, from the artists being chiefly found there, rather than from the absence of picturesque themes elsewhere. On the contrary, there are galleries of charming pictures to be picked up in the mountains and valleys of Virginia, of the Carolinas, and of Georgia, and through all the windings of the rivers of the West—to say nothing of the immense territories, yet unexplored by Art, beyond the Mississippi, and amongst peaks and gleus of the great Rocky Mountains. Still, fortunately for the convenience of the student, there are no finer examples of many of the best features of our landscape than he can find near at hand in the Northern States; on the waters of the Susquehanna, and of the Juniatta, in Pennsylvania; on the Hudson, in the Catskills, or amidst the abundant and beautiful lake scenery of New York; the noble valleys of the Connecticut, and of the Housatonic rivers, in New England, with the Green Mountains of Vermont, and the White Hills—where I now write—of New Hampshire.

Of all these localities, there is none more beloved by the painters than are the Catskills. These noble hills rise in grand array, sometimes to the height of four thousand feet, ten miles west of the waters of the Hudson, forming a salient feature in the famous scenery of that most beautiful of all our rivers. They are thus very readily reached from New York, and many of the painters always make their summer homes within their gorges. Indeed, there are very few of our landscapeists who are not more or less indebted to the Catskills, since nearly all have studied there at some time or other. Cole lived and lies hurried within their evening shades, and from their beauties he drew the themes or the inspiration of many of his most successful works. I once found nearly a dozen artists in sole occupation of a little inn at the entrance to one of the Catskill passes. In their stores of mountain material of all description, these hills are surpassed nowhere in the Union.

After the Catskills, the New Hampshire Hills are the favourite Art Mecca; and just at this time, as for a few years past, they are the shrine *par excellence*. The many bold peaks of this region are all overlooked from the summit of Mount Wellington—our loftiest elevation east of the Rocky Mountains. These "Granite Hills," as they are sometimes called, are visited by hosts of travellers in the brief summer season. Artists are found at all points of the route, though their preferred homes are the quiet places aside. The inn at this little hamlet of Campton has been filled by them all the season through; while another large party has been domiciled in the lovely valley of Conway, a day's walk across the hills to the eastward. Some of our profession have gone this season to the shores of Maine, where (unlike our coast scenery in general) there is much striking rugged rock material. The lakes, which are in number infinite, and in beauty wondrous, are favourite themes of the wandering pencil. Lake George, in New York, and Winnepesaukee here, in New Hampshire, with their hold mountain shores, their fairy islands, and their translucent waters, are among the world's greatest marvels of natural beauty. Then, too, there is the

lake scenery of the wilderness, where, as in northern New York, you may journey for long weeks among the rugged mountains in a boat, passing from one crystal lake to another. The lowland and swamp tracts of the south,—where the rice and the sugarcane, and a thousand luxuriant evergreens, make verdure all the year,—have a peculiar attraction, which would be exceedingly interesting, though they are rarely made so on canvas.

Our sketching-season commences in June and ends in October, with the chance of chilly temperatures at each end, and the certainty of scorching suns in the middle. Our atmospheres, unlike yours in England, are clear to brilliancy, often revealing the minutest markings of distant hills—though prolonged heat will gradually spread a pleasant haze over the landscape, for a thunder-storm to withdraw. With such a climate we, of course, miss the tender, tearful skies, and the juicy, dewy verdure, so grateful in your more moist atmosphere. Our most agreeable and varied cloud-effects come with the passing of the seasons into spring and autumn. The quickly-changing sky—now bright and sunny, now dark and lowering—gives a world of magic and weird aspects to the partycoloured woods at this time of the year, playing with the thousand marvellous hues, as the dextrous painter might vainly seek to play with his most gorgeous palette. Much as you may hear, you cannot, without seeing, put proper faith in the marvels of colour which our October forests present. Apt was the poet's epithet of "rainbow beauty." So riotously varied and brilliant are they, as to upset the gradations from foreground to distance, to the utter bewilderment and dismay of the puzzled painter. Rarely, indeed, is the representation of such scenes attempted, and hardly ever with success. Cole and Cropsey, of all our artists, have been most fortunate in these dangerous ventures. With Cole, they were always subjects of especial and devoted study; and he approached the truth as nearly, perhaps, as we may hope it to be ever reached.

The habit of the artists is to set out in couples, or in larger parties, for some chosen Eden; or to wander until they find an acceptable place, and then to settle quietly down in village inn, or in farmhouse, to study for the season, or until their subjects are exhausted. Their journeys are inexpensive, as they have never very far to go, and, in the quarters which please them best, they live at a very moderate outlay—their board and lodging rarely costing them more than from three to four dollars per week. Thus they can, fortunately, better afford to go abroad than to stay at home. In the humblest, as in the most polished circles, they are always welcome visitants, as I need hardly tell you, who know so well the frank and genial hearts of the craft—the native simplicity, grace, and truth of their manners—their intuitive intelligence, their necessary cultivation, and their ready powers and pleasures of entire adaptation to all natures and circumstances.

Excepting in a few ancient resorts, they and their "mission" are subjects of curious wonderment to the good people. As everybody in this land of active industry is supposed to be more or less usefully employed, the fact that they are simply painting "pictures" for their mere beauty, and the love of the thing, is the last realisation to which the rustics can bring their practical minds. Thus the Art-traveller is mistaken, when accoutred with sketch-box and staff, for a respectable pedlar, and is asked for scissors and combs; or for an ingenious clock-maker, and is invited to step in and correct the cottage timepiece; or for the "census-taker," and is flooded with statistics; or for an organ-grinder, with a solicitation to play, and a wonder where the monkey is kept. When he is seen at work they "allow" that he is making "maps" on the "guess;" he is surveying the new line of railway; or else he must be in search of a suspected coal-hed, or of an iron mine: any "husiness," indeed, but the incomprehensible one of "drawing pictures." But their native quickness soon explains the enigma, and the latent love of Art-beauty, which they generally possess, is easily brought into intelligent exercise.

An overcast or a rainy day, after a long "spell" of dry weather, gives the industrious student an opportunity to lay aside his over-worked pencil, and to indulge the piscatory propensities which he

is very apt to possess: and this he may generally do with reasonable luck, in any of our mountain waters. Perhaps he may sally out with his rifle, in the well-grounded expectation of adding a venison steak to his humble larder: Rocky Mountain-wards his game would come up to the dignity of buffalo and wild Indian.

Should he chance to be alone, and in the rudest regions even, an artist need not suffer in his hours of leisure from a want of intelligent companionship. In the humblest forest cabin he will assuredly find the "papers," and a host versed and voluble in many lore: perchance in woodcraft, or in agriculture, or in theology; certainly in political history, from the battle of Lexington to the battles of Kansas. Should his landlord's "talk" prove to be dull, he may have recourse to the society of the neighbours, or, perhaps, may assemble them from all the region round, and lecture them acceptably upon any subject, from the beginning of the world, to the "dissolution of the Union!" Artists are naturally inclined to all harmless fun, and a peep at the odd pastimes which they often invent for summer hegulement would be merry work. I once knew a gay party who eked out the season's exhausted amusement by getting up a free, public exhibition of their studies, with explanatory discourses (as in panorama displays), in which there was always a great deal more of the spirit of '76, than of the spirit of Art. A "party" at the inn, to the belles of the neighbourhood, or a general serenade of the country, on the eve of departure, is an agreeable manner of leave-taking. Generally, however, the hours of the summer student are too entirely, and too happily employed, to allow *ennui* to gather until it boils over into frolic.

The long day's earnest and exciting toil, and the arduous "tramps" which his labour often involves, over rude pathways, brings weariness, mental and bodily, which makes rest and sleep occupation enough for a brief summer night—to say nothing about the momentous councils which are daily held upon the condition and the promise of the weather: the fluctuations of the finances are not half so eagerly watched at the *Bourse*, or the strategy of states, in the cabinet, as the uncertain skies by the artist, hopeful and yet fearing for the morrow.

All *courage de rose* as it seems to the general observer, what a severe school of patience, the summer life of the artist is! How great the courage required to bear with equanimity those treacherous changes of weather and atmosphere, which are ever breaking the trusted word of promise, compelling him to complete in clouds the sketch began in sunshine! What Roman firmness he needs to breast the angry winds, striving to blow away his easel, his umhrella, and himself together! what resignation he must have to remain quietly in the blinding clouds of dust which passing cart calls up, until he is, in the course of human events, revealed to mortal sight again! How noble in forbearance under the merciless onslaught upon himself and his fair, fresh canvas, of invading mosquitoes, and those countless rank and file of insect allies!

All these, and many other dire *desagrégemens*,—often bodily fatigue, and sometimes a painful consciousness of the fearful disparity between his best achievements and the everlasting beauty of his model,—are incident to the summer life of the artist: but they fly away like morning mists, in the sunshine of pure delight which he finds in the matchless smiles of ever-charming nature.

OBITUARY.—To the record which I sent you last month of Art-history in Boston, it grieves me now to add intelligence of the death of Sela Cheney, one of the most gifted of our profession in that city. He worked solely in crayons, but with a feeling and power which made that simple material, in his hands, all sufficient. Even his portraits, scarcely less than his ideal heads, were ever characterised by a sentiment of grace and spiritual beauty, which did high honour alike to his holy art, and to his own pure nature.

Mr. Cheney died on the 10th of September, at Manchester, near Hartford, in Connecticut. He was about fifty years of age.

THE ROYAL PICTURES.

CAPRI.

G. E. Hering, Painter. R. Brandard, Engraver.
Size of the Picture, 2 ft. 4½ in. by 1 ft. 0½ in.

CAPRI, the *Capræ* of the Romans, is a rocky but beautiful and picturesque island of the Mediterranean, distant about ten miles from Sorrento, and rather more than twenty from Naples, which it immediately faces. "It stands out in bold and rugged majesty, 'like an advanced sentinel,' at the south-eastern extremity of the Bay of Naples, and is separated from the Sorrentine Promontory by a deep channel three miles in breadth. The island is three and a half miles in length, and two in breadth at its western portion, being divided, about the middle, into two mountain masses, of which the largest and loftiest is that on the west, called Monte Solaro, which rises about its centre to the height of 1900 feet above the sea; the eastern division of the island is about 860 feet in its highest part, and terminates in cliffs which plunge precipitously into the sea. The circumference of the island is about eleven miles." * There are in it but two towns, or, more properly, villages: one, Anacapri, stands on Monte Solaro; the other, called Capri, or the "Metropolis," is situated much lower, on a shelving rock towards the eastern extremity of the island; the inhabitants of the two places communicate with each other by means of a flight of upwards of 500 steps, cut in the face of the rock, and carried down it in a very curious manner; these steps are extremely rude, and are supposed to have existed long prior to the time when Capri was under the dominion of the Romans. The population of the island does not exceed 6000 souls, who, with a few exceptions, are either fishermen or agriculturists.

Though Capri, as seen in Mr. Hering's picture, appears little more than a barren, uncultivated rock, the islanders have, by great industry, retained and secured patches of good soil in the steep hill-sides, and in the midst of the cliffs and rocks: these patches, being well cultivated, produce many kinds of fruit and vegetables, olives yielding excellent oil, and vines from which a light hut pleasant wine is made, that was held in high estimation by Tiberius, the Roman emperor, who long resided here in a villa, the ruins of which are still shown to travellers. Capri contains abundant evidences of the Roman sway. "Before Naples fell," says the writer before quoted, "under the power of the Romans, the island belonged to the Neapolitan republic: but, in the reign of Augustus, the republic transferred it to that power in exchange for Ischia. For four years, in his old age, Augustus resided in the island, embellishing it with palaces, baths, aqueducts, and other edifices. Under Tiberius it became the scene of atrocities and tyrannies, more shocking to humanity than the eruptions of Vesuvius and the convulsions of nature were calamitous to the shores of the mainland. The ruins of the twelve palaces which he erected on the most elevated points, to the twelve superior divinities, attest the activity of the tyrant in covering the island with the monuments of his taste and power." Very little more than the sites of these edifices is now to be seen, and in some instances it is difficult to trace even these; but many fine sculptures, which have at various times been discovered, are deposited in the Museum of Naples and elsewhere.

Mr. Hering's view of Capri shows how few and slender, by comparison, are the materials necessary to make a good picture, in the hands of an artist of taste and ability: we have here nothing more than the distant island, looking naked and bald; the deep blue ocean—its surface stirred into gentle ripples; a bit of broken foreground, on which a few figures are reposing; and, over all, a bright azure sky, fading so softly into the remote water-line as to blend with it. The scene is impressively tranquil, and the picture remarkable for the *tenderness* with which the subject is treated: it has all the purity and deliciousness of an Italian evening atmosphere.

The picture, which is in the Royal Collection at Osborne, was purchased by Prince Albert, out of the British Institution, in 1848.

* Murray's "Handbook of South Italy, Naples, &c."

MR. BAILY'S NEW STATUE, "GENIUS."

WE have had the opportunity afforded us of seeing, in Mr. Baily's studio, a new work which that artist has just completed, under the above title; and so long as matters remain unchanged in Trafalgar Square, they who desire to make due acquaintance with sculpture productions like this,—which, demanding good light on every side, in the Royal Academy receive it on none,—must endeavour to make their way into the artist's studio, too. This work is a commission from the City of London,—and will, in all probability, form a portion of what is, on the "*lucus à non lucendo*" principle, called the *Exhibition*, in the cave of sculpture, next year; but its merits are far too essential to have the least chance of revelation in the dim lights which there make even sculpture accident little better than guess-work, and sculpture expression a quality not to be guessed at at all. The figure before us is one more addition to that long series of poetical creations which Mr. Baily will leave behind him, to illustrate the school in which he has wrought, and constitute the elements of an enduring fame. The form is intended to be that of Milton's "Genius," as presented by the poet in his "Areades;" and it may be said that Mr. Baily did a fitting thing when he undertook the personification by his own art of the Spirit which has fed that art through all his days. That the homage has been accepted, is proved by the visible fact, that the same Spirit has again presided at the birth of this new creation.

The lines from the poet which determine the action of the sculptor's figure, are the opening ones of the second song:—

"O'er the smooth enamelled green,
Where no print of step hath been,
Follow me, as I sing,
And touch the warbled string,
Under the shady roof
Of branching elm star-proof!
Follow me!"—

and the *individual* Genius—the "Genius of the Wood"—who is made the agent in Milton's masque, it is Mr. Baily's design in his statue to elevate and generalise into that Genius in the abstract which the mystical and high-sounding verse of the poet indicates as being the inner nature of this visible and helping presence. This is he who leads his votaries "where they may more near behold" the deep secrets of beauty and of truth which "shallow-searching fame hath left untold." This is he who sits at the heart of creation, nursing all its gracious products. This is he who listens to

"the heavenly tune which none can hear
Of human mould, with gross unpurged ear;"—

the ravishing harmony which the Muses (or Syrens) make on the summit of the spheres, singing in eternal concord with the revolving spindle of Fate, or Necessity, and her daughters three—the classical *Laëthis*, *Clotho*, and *Atropos*:—

"Then listen I
To the celestial Syrens' harmony,
That sit upon the nine infolded spheres,
And sing to those that hold the vital shears,
And turn the adamant spindle round,
On which the fate of gods and men is wound."

In one respect this work of Mr. Baily's is more than commonly welcome:—in the fact of its being a male figure. The poetry of this sculptor's mind has habitually sought its expression through female models; and, if we mistake not, this is the first ideal figure from his hand taking masculine proportions since his "Youth returned from the Chase," modelled some half dozen years ago,—as that figure had had no male predecessor for many years. For ourselves, we would select the work before us in preference to any other male figure that Mr. Baily has yet produced offering a presentment of youth, whether mortal or in its attributed immortality. It reflects, with great art, at once the poet to whom the sculptor has gone for his text, and the mythology to which that text refers back. We recognise both the Genius of Greek fancy and the Genius of the *Areades*. Without being so hard and mystical as Milton, we get from Mr. Baily a satisfactory revelation of the Spirit who catches the celestial harmonies and walks amid the secrets of nature. Perhaps it may be said, that the mind which has wrought so long on female models is visible here in the particular type of male beauty which the sculptor

has chosen. Milton's text might have been as successfully rendered by a sterner presence than is here given; but the sculptor, looking past the poet to the mythology to which the latter referred him, has felt himself at liberty to work out the thought in the gentler spirit of Greek Art. The figure is, of course, entirely nude, and the limbs, necessarily mortal in their contours, have been polished into a beauty heyoud any mortal type which could consist with the *maturity* that is necessary to our intellectual apprehension of genius. The *eternity* of the youth—which is a poetical ascription of the same theme—is, however, the reconciling influence. All these things are amongst the evidences of that fine thought in the treatment of sculpture subjects which alone can unlock their true meanings and evolve their spiritualities. Mr. Baily's taste has led him to that refined type of material expression which is the habitual characteristic of his works,—but his understanding has prevented his applying that refinement where it would be aesthetically inappropriate. Genius is, perfect maturity in eternal youth:—and Mr. Baily so understands, and renders, it. As we have said, the action of the figure is that of waving his followers on to some revelation which they cannot make without him. As we look into the spiritual face, and on the superhuman beauty of limb, we read the credentials of this Summerer in the true sculpture tongue:—we feel that the wand with which he beckons, is a wand with which also he can unlock.—The City of London will have good reason to be proud of its Statue of Genius,—which is to occupy a niche in the Egyptian Hall.

ART IN THE PROVINCES.

COVENTRY.—The works executed by the students of the school of Art in this city were exhibited during several evenings towards the end of September, and the prizes were awarded to the pupils, after a careful examination of their productions by Mr. H. A. Dowler, the Government inspector, and Mr. H. Rafter, head-master of the school. The students, both of the public and central schools, were also examined in practical geometry, perspective, outline, and model drawings; it was a competitive examination, conducted by the inspector, who put the question, the answers to which were required to be in writing, one hour being allowed to each paper.

FALMOUTH.—During the past month the Annual Exhibition of the Royal Cornwall Polytechnic Society took place, and from the pictures exhibited the Art-Union of Cornwall selected its prizes. The productions of Mr. T. Philp, principally views around the Cornish coast, were very much and deservedly admired. Mr. Williams and Mr. Hart were also exhibitors. Mr. Sydney Hodges, of London, exhibited several portraits which were objects of considerable interest. The latter gentleman has been employed to paint the portrait of our correspondent, Mr. Robert Hunt. At the conclusion of the exhibition, the following resolution was come to by the Committee:—"That the secretary be requested to write to Mr. Robert Hunt, and inquire if he will consent to sit to Mr. Sydney Hodges for his portrait, to be placed in the Polytechnic Hall, as a memorial of the estimation which the Committee and subscribers at large entertain of his long-continued exertions and services in promoting the advancement and welfare of the society." A subscription-list was immediately started, to which most of the gentlemen of Cornwall affixed their names.

PLYMOUTH.—The eighteenth exhibition of pictures at the *Athenæum*, Plymouth, was opened in October: this year it consisted chiefly of pictures painted by artists born or resident in the counties of Cornwall and Devon. Among them we found in the catalogue the names of Sir J. Reynolds, Sir C. L. Eastlake, P.R.A., Northcote, R.A., Opie, R.A., Haydon, S. Prout, &c. Paintings and drawings, by stars of lesser magnitude, and "strangers and foreigners," included the names of D. Cox, Sen. and Jun., Williams, Condy, T. Mitchell, Luny, Francia, McKewan, J. Varley, Copley Fielding, Turner, Bennett, W. Hunt, &c. &c. The works were contributed by the resident gentry and amateurs, who seem to be liberal patrons of the Fine Arts, and to make—as all ought to do who have the opportunity—a liberal use of them.

GREENOCK.—A School of Art, of which Mr. W. Stewart, head-master of the Paisley School, will have the superintendence, was opened at Greenock on the 3rd of the last month, under most favourable auspices. Upward of one hundred pupils were at once enrolled on the books of the institution.

THE CRYSTAL PALACE,

AS A TEACHER OF ART AND ART-MANUFACTURE.

PART VI.

CONTINUING our visits to the Art Courts and depositories of Art-manufacture at the Crystal Palace, we must ask our readers to ascend with us one of the staircases which lead to the North-east Gallery, and examine a recent erection—costly in character, but in very pure taste—in which are displayed the goods of Mr. CHARLES GOODYEAR, of New York, the patentee and inventor of many applications of Indian-rubber to the purposes of Art-industry.

No very long period of time has elapsed since Dr. Priestley ("Introduction to the Theory of Perspective," 1770) stated as one of the marvels of his age, the discovery of a vegetable gum which possessed the singular power to remove pencil-marks from paper; and, until very recently, this gum was used for nothing else,—unless as one of the toys of boyhood, to give "springyness" to playing-balls. Dr. Priestley as little foresaw the uses to which it would be hereafter applied, as did he who first produced an electric spark anticipate the wonders of the "Telegraph." A visit to the Crystal Palace, and an examination of the contents of the stall of Mr. Goodyear cannot fail to create astonishment; for, while it will be seen how numerous are the objects already wrought out of Indian-rubber, these will only convey an idea of the still larger number of uses to which it is destined to be applied.

Indian-rubber is known to be a gum obtained from trees which grow so abundantly in India, in Java, in Assam, in some parts of South America, especially Brazil, and in other places, as to produce a supply which may be described as inexhaustible. Incisions are made through the bark of the tree, at certain periods of the year, from which flows a milky juice; this, when hardened by exposure to the atmosphere, is "the Indian-rubber," which science has rendered

applicable to all the purposes for which wood can be employed, but having many advantages that wood never can have, while it possesses all the valuable qualities of ivory and horn. It is to the objects formed of this material to which we now direct the attention of our readers. The space to which we are limited precludes for the present all comment on the nature and value of this now precious material, or the various processes through which it is passed before it is made available to the manufacturer; we shall, however, ere long, bring the subject, in all its details, under notice,—with a view first to aid the plans of the ingenious inventor—the inventor in so far as regards its many recent applications—and also to show the large extent of its capabilities.

About twenty years ago, various medals were awarded to Mr. CHARLES GOODYEAR, of New York, for "new methods of manufacturing Indian-rubber;" including "applications of Indian-rubber to painting," to cloth, to shoes, &c. &c. From that time to this he has laboured with amazing vigour and perseverance, in spite of difficulties, all but insurmountable, until he has completely triumphed over them all, established large works in various parts of the States, and in Paris, and now in London, at 47, Leicester Square; while his "show-room" is—as we exhibit it underneath—at the Crystal Palace.

This show-room is in the North-east Gallery: it is not one of the Courts erected at the expense of the Company, but is the private stall of the proprietor. In grace and elegance of construction, however, it may be compared with any of those "structures" which ornament the lower division of the Palace; and it will, we hope, act as a stimulus, as well as an example, to producers, who, while they desire to exhibit their productions under advantageous circumstances, are willing also to adorn the building in which they are placed—thus advancing their own interests while contributing to the gratification and

instruction of the visitors. Mr. Goodyear is a public benefactor by the liberality he has displayed; and there can be no doubt that all his "neighbours" in the gallery will greatly benefit by the attraction he has given to the locality in which he has placed the depot of his works. The architect of whose abilities he has availed himself is Mr. STANNARD WARNE, to whom the erection does much credit.

The stall, be it remembered, is made entirely of Indian-rubber, and an examination of it will suffice to show the capabilities of the material for all the purposes of the cabinet-maker; within and without, will be noticed many works of his class—such as sofas, chairs, tables, bedsteads, drawers, work-tables, pillars and panels, with bas-reliefs. It is obvious that Art has not yet achieved what it may do for this branch of the "business;" but of the capabilities of the material there can be no doubt: it is safe to anticipate its enormous use by the cabinet-maker for all the purposes of elegant furniture. We must content our readers by a bare enumeration of the other objects exhibited:—fruit-plates; card-trays; boxes; boxes inlaid with pearl; watch-cases; bracelets; brooches and rings, set with jewels; fruit-knives and paper-knives; ladies' work-boxes; fans; opera-glasses; jewel-boxes; toilet-boxes in great variety; picture-frames; eye-glasses; ink-stands; paper-folders; powder-flasks; cork-screws; pen-holders; pencil-cases (of peculiar construction); drinking-cups; buttons; syringes; surgical instruments of various kinds; canes and walking-sticks; umbrellas; combs; brushes of all sorts; in fact, it will be necessary to examine the contents of this remarkable stall to obtain an idea of its variety and value, but chiefly to form a notion of the extent to which the manufacture must be eventually carried: for it will be difficult to conceive an object of utility or of Art which may not be ultimately benefited by an invention that may be applied in innumerable ways to the comforts, conveniences, and elegancies of life.

THE INDIAN-RUBBER COURT.

A walk through the passages leading to the several Courts of the Industrial Arts will introduce the visitor to several objects of much interest in Art-manufacture. We have selected for especial notice this

month the works in terra-cotta of Mr. BLASHFIELD, which occupy the extreme end of the passage immediately behind the Birmingham and Sheffield Courts, and near the entrance to the Pompeian Court. The

objects engraved on the succeeding pages, consist of a group of various vases, a pillar surmounted by a vase, a flower-pot, and a pendent flower-pot, and a statue of Hibernia, designed by John Bell.

We have made many attempts in England to produce works in terra-cotta; generally speaking they have been unsuccessful. It is, however, undoubtedly due to Mr. Blashfield to say of him that he has carried this art beyond his competitors, and has achieved much that gives it the high character it may be made universally to assume. Several of his productions are copies, but many of them are original—designed, modelled, and “baked” in his own establishment; and we rejoice to know that his efforts are appreciated, and that his trade in these works is very considerable. An examination of his stall will show that “wants” in this way may be here supplied. All his productions are good; some of them being exceedingly beautiful as examples of design as well as workmanship. Especially we may commend his pendent flower-pots—objects now-a-days of ready sale, but which a few years ago were unknown in England. We believe we may in a great degree claim the merit of their introduction into England; some twelve or thirteen years ago, we published engravings of several, which we had obtained at the establishment of Follet, and other fabricants in Paris, and we took the opportunity of pressing the subject on the attention of English manufacturers. Until

then, we imagine, nothing of the kind had been manufactured in this country—certainly they were then unknown, except in conservatories of a rare order; they are now in general use, and their adoption is rapidly extending.

We can do little more than glance at the various other objects of Art-manufacture gathered together in the Crystal Palace; and as we have dealt sufficiently with the various Art-Courts, our observations must be limited to the passages which lead to and about them—as in the case of Mr. Blashfield's terra-cotta.

We may thus direct attention to examples of works in artificial stone, exhibited by Messrs. Ransome, of Ipswich; the glass mosaics of Mr. Stevens; the Derbyshire spar of Smedley of Matlock; the beautiful productions in Cornish serpentine; a case of admirable productions in papier maché, by Alderman Spiers, of Oxford, generally ornamented by views of the “learned city;” some good iron castings, by Messrs. Kenard; the stove-grates and fenders of Messrs. Benham and Sons, which occupy a room opposite the Sheffield Court; a collection of furniture by Messrs. Filmer, of Berners Street, which fill a large chamber adjoining; and near at hand a fine

assemblage of church garniture, and ecclesiastical furniture, placed in a court gracefully fitted up by Messrs. Crace: a large room is also occupied by the carpets manufactured by Messrs. Jackson and Graham, and many fine French bronzes. Messrs. Hart exhibit here also their admirable brass fittings for churches and domestic rooms: here too are some good lamps and chandeliers, by Messrs. Hullet, of High Holborn; the tea-urns, &c., of Warner and Sons; and a vase of great beauty, and other objects in serpentine, contributed by the Lizard Serpentine Company of Cornwall; some excellent works in terra-cotta, manufactured by Messrs. Gibbs, Canning, and Co., of Tamworth. Mr. Pinches has here his presses for die-sinking, and he produces his medals on the premises. To some of these “Courts” it will, perhaps, be our duty to make more distinct reference hereafter.

Of the Glass Court of Messrs. STEIGERWALD, of Munich, we have prepared engravings; but the publication of these we are compelled for the present to postpone. This court occupies a prominent position, between the Ceramic Court and the Music Court; it is filled with the glass of Bohemia, of which Messrs. Steigerwald are the principal manu-

GROUP OF TERRA-COTTA: MR. BLASHFIELD.

facturers, their great depot being at Munich. The collection consists of an immense variety—objects for use and objects for display; of excellence very varied—some being of unquestionable purity in form and manufacture; others being made for sale among the “masses.”

We may not omit to notice that valuable acquisition to the Crystal Palace, the photographic establishment of Messrs. NEGRETTI and ZAMBRA; these gentlemen possess the exclusive right to photograph for public sale objects contained in the building: they are always at hand to receive and execute orders, and are supplied with a large collection of views either for the portfolio or the stereoscope, and also produce portraits “on the spot.” These productions are all of very high merit; under no circumstances, indeed, could better copies be obtained. To the artist and the manufacturer, as well as to the visitor, this is a great advantage, for whatever may be required can be thus readily obtained; and certainly as “suggestions,” their offices should be much resorted to by all Art-producers.

The Galleries—although entirely devoted to objects “for sale”—contain also much to which the attention of the Art-lover should be directed. They are,

however, to be regarded chiefly as “a bazaar;” and in this respect certainly are an acquisition, for here “small wants” may be cheaply supplied. But here also may be seen, besides the Indian-rubber Court with its startling treasures, some of the best productions of Messrs. Elkington (a row of statues in bronze being especially interesting); an immense variety of the excellent “utilities” of Mr. Sheriff Mechi, many of them being of great beauty, and all of manifest excellence, consisting of cutlery of every kind, and also the far-famed razor-strop, which is said to have been “a fortune;” papier maché goods of admirable quality, and in great variety; and all the other articles which constitute “the stock in trade” of the fact and fancy “hardwareman,”—many of them beautiful, and all good; a large collection of the imported novelties of Mr. Holt; the Irish jewellery of Mr. Waterhouse, of Dublin, presenting many objects in which novelty is combined with grace, and of admirable workmanship—brooches, bracelets, jewellery in general, and the very beautiful Nightingale Brooch. Here, too, are the stamping-presses of Mr. Jerrett; a large collection of Chinese productions, from fans at sixpence each to costly ivory carvings; and Mr. Mahood's

pretty and pleasant *bijouterie*, manufactured generally in Ireland. All these are in the North-east Gallery; the South-west Gallery is well filled with articles of commerce, among them being some excellent examples of the produce of Glasgow and Paisley. The visitor will find, indeed, much in these galleries from which he cannot fail to derive gratification and interest.

But while pointing out to him the numerous ways in which he may be pleased and instructed *within*, we must not omit notice of those which demand attention *without*.

Among the leading attractions of the Crystal Palace are assuredly the GARDENS—those within and those without the building. They are sources not only of enjoyment, but instruction, while they add very largely to the grace, elegance, and general effect of the Exhibition. One may imagine what a calamity it would be if, by any evil chance, the flowers and foliage were withdrawn from the interior. It is impossible to praise too highly the whole of the arrangements which have been made by Sir J. Paxton—and are, and we hope will long continue to be, under the direction of Mr. GEORGE EYLES, formerly one of the gardeners of the Duke of

Devonshire. The objects which most pleasantly meet the eye are the vases underneath and the pendent baskets above; the latter are of large size, and are always "gay," filled with flowers of positive colour, with trailing plants, running many feet down, and refreshing with the hue of brilliant green: but everywhere, let the visitor walk where he may, he perceives some botanic specimen, either rare or beautiful: it is not too much to say, therefore, that this particular department of the Exhibition is

of incalculable value—the world contains nothing to compare with it under a single roof.

On entering the Palace from the railway colonnade, the first object that presents itself to the visitor is a group of plants, figures, animals, and birds, intended to represent the botany, ethnology, zoology, and ornithology of Australia. Immediately opposite are similar groups representing the same features of the different countries of the Old World; and on the opposite side of the Nave will be found other groups depicting the like features of the New World; the

small Swiss moss (*Lycopodium denticulatum*) forming, as it were, a green carpet for the figures to stand upon. These groups have always proved a great source of attraction to the many who visit the Crystal Palace.

The basin in the Nave is replete with the finest aquatic plants in cultivation. The *Victoria regia* has also been grown here to great perfection—leaves six feet in diameter. The freshness and vigour of the *Nymphaea*, together with their gorgeous flowers of the most lovely colours and ample foliage, spread out on the still waters of the mimic lake, with gold and silver fish playing sportingly in every direction; then add to that the circular vases, eight in number, inserted in the margin of the lake, as if to make its outline more agreeable, and filled with the most beautiful flowers, ever admired for their freshness. Nearly 26,000 plants are used annually for the supply of these vases alone, and these plants are all raised and perfected at the Crystal Palace propagating-houses.

Standing against the Screen of the Kings and Queens, or in the Exhibitors' Gallery above, the finest view of the plants in the long vista of the Nave may be obtained, and their relative value and fitness as powerful auxiliaries for the decorating the Palace ascertained. The long lines of orange-trees, pomegranates, aloes, and sweet-hays, numbering upwards of 200, and the double row on each side of hanging baskets, filled with the most lovely flowering plants and creepers, which hang down from the baskets, and, in many instances, touching the plants in the beds below, and ascending from them up the suspending wire to the under side of the top gallery, viewed as a whole, create a most pleasing effect, and entirely peculiar to the Crystal Palace. These baskets require from 8000 to 9000 plants to furnish them.

We must notice a few of the larger and more interesting plants in the Nave, first observing that the beds, for the convenience of reference, are all numbered from left to right, and the numbers are fastened to the upright edging of the beds on the south of centre, and on the columnis on the north of centre. In Border No. 1 is a fine plant of the New Zealand kakaterro-tree (*Dacrydium taxifolium*), which acquires the height of 200 feet in its native country; *Acacia foliosa* 25 feet high; a large plant of *Rhododendron arboreum*, presented by Miss Cox, of Lawford House, Manningtree, Essex, and purchased when five inches high for five guineas; in close contiguity is the *Westeria sinensis*, a Chinese climbing-plant, and already reaching nearly the centre of the roof. In Border No. 3, on the west of South Transept, will be found fine examples of the New Zealand spruce (*Dacrydium cupressinum*), of *Camellia reticulata*, bearing in spring its gigantic red flowers, nearly six inches in diameter; of the Paraguayan tea-tree (*Ilex Paraguayensis*), the leaves of this plant are used by the natives of that country for making tea; an hybrid *Rhododendron* nearly 20 feet high, presented by the Duke of Devonshire; an *Auracaria excelsa* 35 feet high, presented by Veitch & Son; and many fine specimens of camellias, azaleas, &c. &c. In Border No. 5, opposite, is a large plant of camellia—Lady Hume's Blush—quite a tree, nearly 20 feet high, and 12 feet diameter; a beautiful specimen of *Acacia dealbata*, presented by E. H. Palmer, Esq., Cannonhill, Maidenhead, 20 feet high and 50 feet in circumference, and in the spring is covered with its beautiful golden yellow flowers. At the four angles of the Transept are placed fine specimens of white camellias. In the centre of the Transept is a magnificent specimen of American aloe, presented by Mrs. Jenkyns from the Deanery, Wells, and brought by her from the ruins of the Palace of the Cæsars, in Rome, in 1828, then a tiny plant. At both ends of the basin are fine specimens of *Auracaria excelsa*—those on the north side presented by the Duke of Wellington; on the south, by Thomas Marson, Esq., Croydon. In Borders Nos. 4 & 6, on the other side of the Transept, are fine examples of *Camellia myrtifolia*, 17 feet high; also white *Azaleas*, *rhododendrons*, the new and beautiful *Acacia grandis*, the curious *Agnostis sinuatus*, with its singular sinuous foliage, and a fine plant, in close contiguity, from Australia—*Ficus macrophyllus*—seldom seen so large in this country, presented by the Royal Botanical Society of London. In the opposite border are fine examples of the indian-rubber-tree (*Ficus elastica*); of *Berberis nepalense*, with its graceful foliage; and several acacias 20 feet

high and upwards: here has been grouped the greatest variety of foliage, in order to produce agreeable effect.

In proceeding down the nave, and opposite the Pompeian Court, are two fine specimens of the *Aura-*

caria Bidwellii; the seeds of this plant are eaten by the natives of Moreton Bay, and the tree is called

by them *bunya bunya*. At the centre entrance to the Sheffield Court are two magnificent tree-ferns

(*Dicksonia antarctica*) from Van Diemen's Land; they are found in abundance by the sides of rivulets in the shady valleys of that island; and opposite will be found *Podocarpus Totarra*; this tree furnishes the most valuable timber in New Zealand, and the possession of them has often been the cause of war among the savage nations. Border 13 contains a fine specimen of the blue gum-tree of Australia (*Eucalyptus globulosus*); these may be called the mammoths of Australia, many of them growing upwards of 200 feet high, and 30 in diameter. In Border No. 19, by Egyptian Court, is a fine liliaceous plant, the fan-leaved *Rhipidodendron* (*R. plicatile*); many temperate palms are planted here, which look healthy, but do not grow with that luxuriance which warmer climates produce. In these beds are also two large plants of the *Sparmannia Africana*, presented by her Majesty; this is an old favourite conservatory plant, now almost lost sight of. By the Roman Court are two fine *Auracaria excelsa*, also presented by her Majesty. In Border 24, and in many other places, will be found specimens of the Funeral cypress, brought by Mr. Fortune from the Vale of Tombs, in North China, and used by the Chinese much in the same way as we use our weeping willow; this appears to be the plant figured on our chiu, and known as the willow-pattern.

Proceeding through the curtain, you enter the tropical end of the Palace, where the *Musee* and palms, grouped with other fine-foliaged plants, produce an effect quite tropical. Here is a large collection of plants; we may allude specially to one interesting group in Border No. 3, in front of the Assyrian Court, where may be seen the tea and coffee trees; the juncube of the East Indies; the sea-side grape; the celebrated cow-tree of the Caraccas, which affords abundance of nutritious milk to the poor inhabitants of that part; the ginger-plant; the rose-apple of the East Indies; the nutmeg, pepper, and cinnamon-tree; the star-apple of the West Indies; the Avocado pear from the West Indies; the graceful tamarind-tree; the Australian cabbage-palm; the jack-tree, an inferior species of bread-fruit; the castor-oil plant; the custard-apple; the Malabar nut-tree; the banana-fruit; the wampee-fruit of the Chinese; the guava from South America; the honey-berry from Ceylon; the sugar-cane from India; the celebrated ordeal-tree of Madagascar (*Taughinia veneniflua*)—this tree stands foremost amongst the poisons, the kernel of the fruit, although not larger than an almond, is sufficient to destroy twenty people (see Lindley's "Vegetable Kingdom," p. 599); the *Mimusops elengi*, also a tropical fruit; the *Melodinus monogynus*; the *Flacourtia cataphracta*—both fruit-bearing trees. In the centre of the bed is a fine group of *Musee* plants, so highly esteemed for the abundance of nutritious food it yields to the natives in all parts of the torrid zone—the fruit of one plant often weighing as much as 50 lbs.; the Peruvian bark-tree; the Chinese paper-plant; and many interesting flowering plants interspersed. In the centre of the Nave is a fine specimen of the Palmetto palm—*Sabal Palmetto*; and in Border No. 6 is a tall palm (*Lantania Borbonica*), 40 feet high, formerly in the collection of the Empress Josephine at Fontainebleau; it took thirty-two horses to bring this large palm from Mr. Loddiges' Nursery, Hackney, to the Crystal Palace. There is a fine group of *Musee* in Border No. 4, some of the plants reach 25 feet high; and in Border No. 2 is a very large specimen of the Caffre bread-tree (*Encephalortus tridentatus*), 14 feet high, and probably 3000 years old. Situated between the avenue of sphinxes, is a fine collection of palms, containing many rare species. In the basins is a fine plant of *Victoria regia*, or royal water-lily, which has grown and flowered vigorously this season, supported on all sides with the finest aquatic plants. The vases round the margin within the curtain are filled with ferns, variegated plants, palms, and stove-flowering plants. The two outer vases are treated the same as those at the south end, and take 6000 plants per year to furnish them.

We are unable at present sufficiently to direct attention to the models of extinct animals, constructed by Mr. WATERHOUSE HAWKINS, which have been placed around a mimic lake at the lower end of the gardens. These are, we regret to say, not generally visited: the fact is, that people become fatigued by so much to see and think about, and a walk is out of the question towards the close of a

day, for the sole purpose of inspecting these singular works: they do, however, attract the notice of all passers by in the railway-carriages, for they are seen somewhat satisfactorily from the "high-road."

The gardens are improving rapidly: age is having its influence in the growth of shrubs; the "climbers" are covering unsightly objects; the plaster casts are in the course of removal, and are replaced by statues in marble; and ere long this garden will be of unrivalled beauty. The fountains "play" very frequently; not in their "entirety," but sufficiently often to make this feature, also, one of the important improvements which naturally result from time.

We have now carried to a close the series of papers in which we have endeavoured to bring under the notice of our readers the Crystal Palace, as a means of extending the influence of Industrial Art, and advancing the interests of its meritorious producers, by acting as an "Exhibition Room," so to speak, in which their productions may be seen, examined, and estimated.

We cannot but lament, as a grievous error, that manufacturers have not sufficiently availed themselves of the advantages here placed at their disposal—an error which we hope will not be continued, when another season furnishes new evidence of its singular applicability to all the purposes of commerce. It is, indeed, difficult to imagine circumstances more auspicious to the manufacturer—independent of those which always secure to him a large attendance of persons of wealth and taste, by whom his "goods" must be seen, with leisure for a proper scrutiny of the objects they require. These objects are shown too in good lights, with ample space for their display; and where a full and complete exhibition is desired, the Crystal Palace certainly possesses advantages to be found nowhere else.

Yet this fact does not seem to have been understood; the several Art-Courts are far too scantily furnished: Birmingham and Sheffield, for example, contain the productions, each, of only two or three manufacturers, in so far as the staple of the great capitals of metal manufacture is concerned. Even these contributors must have felt that the poverty of the display prejudices their interests,—for purchasers are discouraged when they consider the paucity of choice, an evil that would not arise if the courts were full, and conveyed a general notion of the varied and valuable produce of the districts.

We repeat what we have already said—if the great manufacturing cities and towns of England will take this matter up, appoint properly qualified agents, and be rightly represented at the Crystal Palace, very beneficial effects cannot fail to follow. This object has been in a measure accomplished in the Ceramic Court: we say "in a measure," because undoubtedly it is not as yet what it may be and ought to be; for, although Messrs. Minton, and Alderman Copeland, Messrs. Kerr and Binns, Messrs. Ridgway and Bates, and one or two others, are well represented (and that they have hence derived much fame and large profit is certain), the collection is by no means an exposition of the Ceramic manufacture of Great Britain; and will not be until every producer of meritorious works has space, more or less, in which to exhibit his productions. Next season, no doubt, Mr. Battam—to whose persevering industry and great ability we have accorded the praise to which he is eminently entitled—will study to make this Court perfect, by exhibiting fewer of the ancient works, and more of the modern produce of the art of the potter.

Of a surety, then, there is no existing school for study equal to that supplied by the Crystal Palace. We have endeavoured in these papers to stimulate the manufacturer not only to learn, but to teach there: every contributor of excellence is in his degree a teacher; and surely he will be a learner as often as he visits the building.

We shall commence next year another Series, of which the Crystal Palace will be our text-book. The Rev. Charles Boutell, M.A., F.S.A., has undertaken to write for the *Art-Journal* a number of articles, in which the Crystal Palace will be treated as a Teacher from Ancient Art,—not relinquishing our plan of representing and describing, by pencil and pen, the progress of Art-Industry.

Such manufacturers as may hereafter contribute to any of these Courts may be assured that we will do our utmost to make their works known through the columns of our Journal.

THE BELGIAN SCULPTURE AT THE CRYSTAL PALACE.

IN one of the smaller compartments of the Crystal Palace which adjoin the Byzantine Court, the attention of visitors has of late been attracted to a collection of works in sculpture of comparatively small size, and consisting of both groups and single figures: with very few exceptions, the subjects of them all are more or less directly impressed with a religious character; and the whole have evidently been produced by the same artist. The name of this artist is set forth to be "the late C. H. Geerts, of Louvaine;" but as to the period at which M. Geerts may have passed away from the scene of his studies, nothing is stated; neither does there appear any explanation either of the circumstances under which his works were produced, or of the causes which have led to their being placed in their present position. There they stand, sculptured by M. Geerts, who may no longer be numbered amongst living artists; a brief MS. notice of its own particular subject is attached to each of the groups; the single figures are, for the most part, distinguished only by a number, the significance of which is altogether a mystery—and, in the case of many of them, even this distinction is wanting: yet these sculptures are most eloquent in their deep silence; there rests upon every figure that palpable impress of a master-mind which empowers it to speak for itself as a work of Art, and constrains the thoughtful observer to ascertain through inquiry the minor details of its history.

We learn then that, by the death of M. Geerts, we have this year lost a true and a truly great artist—one who, like many that have preceded him, in the noble achievements he had realised gave a promise of still nobler things to come. That promise he has not been permitted to fulfil. We propose now to consider what he has bequeathed to us, as his actual contribution to Art in our own times.

There are assembled together in this collection about sixty groups, varying in the number of their figures from two to five and six; and, besides these and associated with them, there are about ninety single figures. The smaller figures, whether in groups or not, vary in height from about twelve to about eighteen inches: a very few are larger. Certain incidents connected with the Crucifixion furnish the subjects for sixteen groups; scenes in the life of our Lord, and more particularly in His earlier years, are exhibited in another series; and various other events recorded in the Scriptures, together with certain legendary occurrences, make up the remaining groups. The single figures consist of representations of the person of the Saviour, various angelic forms, the Apostles, the Virgin Mary, and many sainted personages. All are in plaster, with the exception of a Virgin (the last work of the master), most delicately executed in the purest white marble, and the head of a child in the same material; and the great majority of the figures were designed to be produced in wood, as the decorative accessories of stalls and panel-work. These are the original models; some of the designs have never been carved or sculptured with the chisel, but the larger proportion have been executed in accordance with the original intention of the artist, and they exist at Antwerp, Bruges, St. Gomen à Lierre, and other places, chiefly in Belgium. The present collection is the property of the artist's widow; and it is exhibited in the Crystal Palace both in the hope of securing to Madame Geerts a provision, and also as consisting of remarkable examples of Art. And remarkable examples of Art they are—remarkable in this

very important respect, that they at length have demonstrated the true practical value of the study of mediæval art to the artists of our own day. An enthusiastic student of the noble works of the mediævalists, M. Geerts was led by his enthusiasm to aim far higher than to become an accomplished copyist of the works which the artists of the middle ages had produced. He searched out the principles of Art which inspired, and guided, and governed the artists of those days. He aspired to a sympathy with them in the spirit in which they worked, and he attained to such sympathy. But he was not thus led away from all that Art had done and had taught in other times, and under widely different conditions. Hence he was enabled to render his works the embodied expressions of a most felicitous combination, or rather, of a perfectly harmonious blending together of diversified qualities; the drawing in them is severely true, yet always free and elastic; the composition is well adjusted, regular, and touchingly natural; while breadth, vigour, and simple expressive dignity are enhanced by the utmost refinement of sentiment and delicacy of touch.

Now, this is precisely the result which ought generally to have ensued from the prevailing study of mediæval art; it is, however, but a truism to assert that the results thus actually produced have been altogether of another kind. Mediæval works have been copied—at least, strenuous attempts have been made to copy those works; and such copying has been designated a "reproduction" of a long-lost style. It has not really been—in reality it can never be—anything of the kind. The style of art that sheds such lustre over ages which have been too readily stigmatised as darkened, cannot live again in precisely the same conditions of existence in which it lived before the long suspension of its vital functions. It must revive, if it do revive, in the revival of its spirit, not in the reiteration of its productions. It must become again a living principle, of which the vital energy is measured by its adaptation to existing circumstances, and its fellowship with whatsoever is great and excellent. In a word, if we revive mediæval art at all, we must accomplish that result by making it our own Art, and by striving to render it far better and nobler than it was in the middle ages. M. Geerts has taken the initiative in the actual accomplishment of this: unlike our artists in coloured glass, who consider the imperfect drawing and the crude composition of their mediæval models to be no less essential than their lustrous hues, as characteristic of their own productions, M. Geerts has shown in what manner the grandeur of one period may be elevated by the combined science and cultivation of another; he has shown that to be the most worthy style of art, which exhibits the greatest possible degree of excellence, while it is affected by the least possible amount of imperfection.

Walk up to which of his works you may, mediæval feeling at once declares to you how powerful was its influence with M. Geerts: still, you would not for a moment think of pronouncing the work before you to have been executed in the middle ages. And wherefore not? By no means in consequence of any inferiority in the work itself, but because much is palpably present in it which indicates the operation of principles and sentiments in those times unknown. Take, for example, the panel for one of the Antwerp stalls, with the two Maries arriving with their store of spices at the rock-hewn sepulchre in the garden: the wonderful tale is told with amazing truth and impressiveness. The women can be no other than those two pious ministrants. The very fulness of the energy and point of the fourteenth-century sculpture is here expressed. If

you study the drawing, it is found to be severely truthful; and, at the same time, the most exquisite refinement characterises alike the action of the group, the east of the draperies, the expression both of the countenances and the hands, and the movement of the figures. Perhaps this is in every respect the gem of the entire collection: certainly none can surpass it, while but very few can equal it, as a *true mediæval work of the middle of the nineteenth century*. These remarks are, indeed, also applicable to some of the single figures: we would specify those numbered 39, 40, 48, 63, 66, and 71. These are all figures of the smallest size, and they show no less the versatility than the consistent action of the artist's powers. Such is also the case with most of the figures of angels—they are truly angelic in their conception, and rendered with the purest feeling. Amongst the larger figures, those of St. Peter and St. John are singularly fine. The groups which have been executed for Middlewerk Church claim also particular notice. The life of St. Willebrod is here illustrated in a series of groups: the finest is that which represents the saint preaching against false gods. In two others of these groups, the consecration of this saint to the episcopate, and his death, are depicted; and these compositions illustrate, in the most impressive manner, the artist's wonderful faculty of compact, yet never crowded, grouping. From the various other groups we select the following as being truly admirable in every point:—"The gates opening to all the world on the birth of the Saviour, from an altar in the church of the Madeline at Bruges." In front kneels the Virgin with the Divine Infant, and in the background are figures of ecclesiastics, warriors, and persons in the ordinary attire of peace, either entering in at an open portal, or advancing towards it: this approach of the figures is very finely rendered. Five of the Antwerp stall-panels, comprising the Annunciation, the Visitation, the Offering of the Magi, the Purification, and the Virgin seated with the Holy Child, and surrounded by adoring angels—all are impressed with the utmost purity, combined with a simple unaffected dignity: the incidents themselves are made out with a truly articulate expressiveness; and the fine contrasts which several of the situations admit have been rendered with equal force and delicacy. In the Visitation it is impossible to estimate too highly the wondering, yielding, adoring submission of the one figure, and the eloquent, encouraging, respectful earnestness of the others. A "Last Supper," from the Madeline at Bruges, is another of the most effective groups: it is treated somewhat after the Da Vinci manner, though the grouping is much closer. The exquisite group of the "Innocents carried up to heaven by angels" was exhibited in 1851; it is now so placed as to form the central and culminating object amidst several other groups of angels, who are playing upon various instruments of music, and singing hymns of praise. We would direct particular attention to the care bestowed upon every accessory in these compositions; the musical instruments, and the lecterns upon which the scrolls of music rest, are no less worthy of admiration than the beautiful figures themselves.

Not the least striking quality in M. Geert's figures is the happiness of their attitudes: some of them are specially adjusted for a position upon the curved ends of stall-standards; others form finials; others again have no peculiar adaptation to any other circumstance than the conditions of the incident which they represent. In like manner, this artist's groups derive no inconsiderable portion of their effectiveness from the skill and judgment with which the grouping itself is formed and adjusted. In the panels, the true power of subordinated relief

is felt rather than shown; while, in the clear-cut works, the composition of the various sets of figures shows the most consummate art in the apparent absence of all studied arrangement: all is so truly natural, that the work of a great artist is immediately recognised. A certain amount of Roman Catholic feeling, as must have been expected, pervades some of the subjects; but even here the true Catholicism of Art asserts a supremacy which is not to be subdued.

It is to be hoped that this collection will not be altogether dispersed. Certainly it would be well that some portions of it should become the property of the nation; and other portions would find an appropriate final resting-place beneath the roof which now covers them. With the view to disseminate as widely as possible the beneficial influences of such works of Art as these, we cannot refrain from also expressing a hope that many of the single figures, with some of the groups, will be produced in Parian.

We would advise a careful study of these works to all who love Art, and who, because they love Art, desire to see it occupying a pre-eminent position amongst ourselves. We have written in strong terms of commendation of these Belgian sculptures: in so doing, we have both paid a deserved tribute to high worth, and have pointed out upon what grounds this collection bases its claim for study, and rests secure that the result of study must be admiration. A definitive and practical result of the study of these works can scarcely fail to be a recognition of the soundness of the principles which have led to their production. Let these principles be thoroughly mastered and widely applied, and we may indeed hope to welcome a school of artists who may at once carry their Art higher than Art has ever yet attained, and elevate both the taste and the feeling of the age which they adorn.

OBITUARY.

PAUL DELAROCHE.

The modern school of historical painting has just lost one of its greatest ornaments by the death, in the sixtieth year of his age, of Paul Delaroche, which took place at Paris, on the 3rd of November, after a somewhat brief illness of about three weeks,—though for some time past his health had been so impaired as to compel him to cease from his labours, and to live in comparative retirement. The loss of such a painter cannot be limited to the country of his birth; as the fame of Delaroche extended wherever Art is known and appreciated, so widely will his death be deplored.

In the volume of the *Art-Journal* for 1845 appeared a biographical sketch of this artist, accompanying his portrait, and illustrations from two of his pictures: we refer to it now for the limited notice to which our space restricts us.

He was born in Paris in 1797; his father held a post connected with Art in the *Mont de Piété*, to which Paul's elder brother, Jules, afterwards succeeded—for both sons indicated at an early age a strong predilection for Art. Paul commenced as a landscape-painter, but soon relinquished this department, and entered the studio of Gros, at that time filled with most of the youth who aspired to the higher walk of history. The "classicisms" at that time prevalent in the French school he, however, considered heterodox, so he took up a position between them and the romantic, and laboured to create a style more in harmony with the temper and habits of the age. His first picture, "Naphthali in the Desert," was exhibited in 1819, but it attracted no attention; another, the subject of which was, "Joas rescued by Josabeth," was more successful. In 1824 he produced three pictures that obtained a gold medal: the first represented "Vincent St. Paul preaching in the Presence of the Court of Louis XIII.," the second, "Joan of Arc examined in

Prison by the Cardinal of Winchester;" and the third, a "St. Sebastian"—the first two of these have been engraved. In 1827 Delaroche exhibited "The Capture of the Trocadero," a picture commissioned by the French Government, and for which he received the Cross of the Legion of Honour. His other principal pictures of about this period are—"The Death of Agostino Carraeci;" "Flora Macdonald succouring the Pretender after the Battle of Culloden;" "The Death of Queen Elizabeth," now in the Luxembourg; and "The Death of the President Duranti."

Events recorded in English history were frequently made the subjects of his pencil, as appears by a list of some of the pictures painted subsequently to the time just referred to. In 1831 he produced "The Sons of Edward IV.," which has been engraved and lithographed more than once, and which induced M. Delavigne to write his tragedy on the same subject. This was followed by another well-known work, "Cardinal Richelieu on the Rhone, with Cinq Mars and De Thou," and also by his "Cardinal Mazarin presiding, almost at his last moments, at a game of Lansquenec." In 1832 Delaroche was elected into the "Institute," and in the same year he exhibited his "Cromwell contemplating the dead body of Charles I.," a picture which has gained as much popularity in England as in France; so also has the "Execution of Lady Jane Grey," exhibited in 1834; with two other works—"Galileo studying in his Cabinet," and a "St. Amelia," the latter intended as a model for the great window of the chapel at the Chateau d'Eu.

In 1835 Delaroche proceeded, for a short time only, to Italy, where he formed a matrimonial alliance with the only daughter of Horace Vernet, then Director of the French Academy at Rome. Between 1835 and 1837, both years inclusive, he exhibited "The Death of the Duke of Guise," "Charles I. in the Guard-Room," and "Lord Strafford going to Execution,"—these two last works are too well known in England to require any comment. In 1835 it was proposed to the artist to decorate the walls of the Church of the Madeleine with suitable compositions, but circumstances subsequently led to his resignation of the task; he was, however, fully compensated for any disappointment he might have felt with reference to this matter by having confided to him the adorning of the amphitheatre of the *Ecole des Beaux Arts*—a work to which he devoted three years of most assiduous labour; the result was that fine composition, so dramatic, but dignified, earnest, poetical, and truthful, the "Hemicicle," which recently escaped destruction in the *Palais des Beaux Arts*. The original sketch of this work, as many of our readers will remember, was among the pictures hung last year at the French Exhibition, in Pall Mall. Of late years Delaroche's performances have been "few and far between."

In 1844 he paid a second visit to Rome, where he painted a portrait of the Pope: among the few works of this class from his pencil we ought not to omit the mention of his picture of the Countess Rossi, better known as Mademoiselle Sontag, the distinguished *cantatrice*, and that of Napoleon at Fontainebleau—the last, exhibited at the rooms of Messrs. Colnaghi three or four years since, is so far beyond a mere portrait as to rise to the dignity of an historical subject. By the way, the head and face of the lamented artist were very like those of the late Emperor.

With the exception of Ary Scheffer, no painter of the French school presents so few of the characteristics of that school as Paul Delaroche. Dramatic in his conceptions, he expressed them with an originality, a simplicity, and truthfulness, that carry conviction of their reality to the spectator; his mind seems always to have been stored with images cast in nature's own mould, but vividly stamped with the character of the age in which they lived, and which history has assigned to them as individuals; these he embodied in his art with an utter independence of preconceived systems of painting, though with a practical perfection arising from earnest study of previous works. As a teacher he attracted a large number of pupils, whose regard he won as much by his kindness of manner as by the excellent instruction he imparted. In private life few men drew around him a larger circle of sincere friends; utterly free from any assumption of superiority, frank and affable in his manners, liberal in exposing

the riches of his studio, and communicative in reference to the practice of his art, his society was as much sought after by the amateur from what he might learn of Art when in his company, as it was rendered agreeable to all by his easy and cheerful bearing, and his intelligent conversational powers, as we know from our own experience. His death will cause a void, not easily filled up, in the Art and Literary circles of Paris.

MR. JOSEPH JOHN POWELL.

[In the *Art-Journal* for November we printed some remarks concerning this artist, whose death we earnestly deplored—the more so as we were under the belief that it was hastened by indiscretion. We cordially rejoice to learn that this impression was entirely erroneous; and we hasten to make the best amends in our power, by availing ourselves of the information communicated to us by some of his friends, who knew him better than we did, and who assure us how thoroughly we have been mistaken as to the causes which led to his inability to realise the high hopes that had been cherished as to the fame for which he was early a candidate. It is needless to say how much more happy is the task of recording praise than censure; and it is, therefore, with exceeding satisfaction we recall the few words we printed concerning this accomplished young man, whose death we considered, and still consider, as a public misfortune. We publish, therefore, with much pleasure, the following memoir, supplied to us by one of Mr. Powell's many friends, merely observing that it tallies with notices furnished us by other correspondents]:—

"The late Mr. Joseph John Powell, a young artist of considerable promise, died on the 20th of September last, at Southampton, deeply regretted, not merely by the circle of his private friends, but by all who were acquainted with his works: few as they were, they bear ample testimony to his genius. Mr. Powell was born of English parents, at Douai, in France, in January, 1814. He commenced the study of his art at that town, and continued it until 1831 at Lisle. He then came to England for the purpose of becoming a student of the Royal Academy, where he entered in May of that year. Studios and reserved, he made few acquaintances, and sought no patrons. It was partly owing to this circumstance that his only source of income—the exercise of his profession—was little productive; and as his family could afford him but occasional, and never considerable assistance, he was subjected at the outset of his career to much difficulty and privation. To these early hardships, pressing heavily on a constitution naturally delicate, may be probably traced the ultimate failure of his health, and his premature decease. Poverty and ill-health, however, did not damp the ardour of the young student, whom we shortly find outstripping his fellow-students, and carrying off with ease the prizes of the Academy. In December, 1852, he competed for one prize—the silver medal for the best drawing from life—which he gained *longe optimus*; but the following year, encouraged by the first success, he contended for, and obtained, three other silver medals for the best drawing from life, the best painting from life, and the best draped model. He had also in preparation for that occasion an oil-painting, 'Orestes pursued by the Furies;' but was prevented from finishing it in time to compete for the gold medal. The writer of the present notice has seen this composition, which might favourably be compared with the works of some older artists. In 1855 the gold medal was awarded to Mr. Powell for his historical painting of the 'Death of Alcibiades,' in which he seemed to have laid the foundation for a high reputation. Mr. Powell now proposed to himself to compete for the travelling studentship; and was engaged in preparing for this contest, when the illness commenced which terminated in his death. He was recommended change of air as the only hope. A month's tour in the Isle of Wight and Guernsey produced a fallacious improvement in health, and almost total exhaustion of pecuniary resources; and he was returning to London to resume his labours, when he was again taken ill at Southampton, where he lingered a few weeks, and died. In him Art has lost an earnest and enthusiastic student, and Mr. Cross, to whose instructions he was much indebted, a highly creditable pupil."

THE FIRST CRADLE.

FROM THE GROUP BY A. H. DEBAY.

Few persons, we imagine, who were attracted by the foreign sculpture exhibited at the Great Exhibition in 1851, will not remember, and with feelings of pleasure, the fine group sent from Paris by the sculptor, A. H. Debay, and entitled "Le Premier Berceau," or, to give it an English name, "The First Cradle." A cast from it is now in the Crystal Palace at Sydenham.

In England, it is not an uncommon occurrence to find young sculptors ignoring their art from the want of patronage, and directing their attention to the sister-art of painting; and in France, the reverse is not unusual. Auguste-Hyacinthe Debay is the younger son of Joseph Debay, and brother of Jean B. Debay,—all of them sculptors of considerable reputation, resident in Paris. Auguste was born at Nantes, but went at an early age with his father to Paris; studied some time under Gros, the painter, and commenced his artistic career in this department of Art.

In 1819, while a student in the *Académie des Beaux Arts*, he gained a third-class medal in 1823, for the best historical picture—the first grand prize of Rome, as it is called, because, as in the case of the large gold medal bestowed by the Royal Academy, it entitles the possessor to proceed to Italy to study; and in 1831, a medal of the first class. In the *Palais des Beaux Arts*, at the Great Exposition last year in Paris, he exhibited three pictures:—"The Old Man and his Children," painted in 1835; "The Two Friends," painted in 1841; and the "Portrait of a Lady," painted in 1846. The only sculptured work he exhibited at the same time was that from which our engraving is taken. We know not when he commenced to practice the art of sculpture, but it is evident he was engaged both on this and painting at the same time, for "The First Cradle," was exhibited at the annual *Salon de Louvre*, in 1845.

There is a novelty in the conception of this group that entitles it to the admiration of the amateur, over and above the manner in which the idea is carried out. The disposition, so to speak, of two young children in the lap of their mother, cannot be very easy of treatment; and yet M. Debay has placed them picturesquely and naturally. But we cannot help feeling, especially when we look at the group in profile, as in our engraving, that there is some sacrifice of grace in the attitude of our first mother, Eve—for she it is whom the sculptor has here represented: grace, however, is not a quality we generally expect to find in French sculpture—it has never been a characteristic of the school. "I remember," says Mrs. Jameson, "in the Great Exhibition of 1851, being struck, as all were struck, by the wonderful elegance, fancy, and invention displayed in the French sculpture, including the ornamental bronzes—by the careful design and finished execution of the most minute, as well as the larger objects; but we were also struck by the predominance of the voluptuous and the ferocious sentiment in some of their finest designs—the humane feelings, the moral sympathies, outraged on every hand. The appetite for sensation is as obvious in French Art as in their drama and literature—all react on each other."

In describing this group, the same discriminating critic remarks:—"Eve, our general mother, holds on her knees, and encircled in her arms, her two sons, Cain and Abel, who slumber with their arms entwined in each other. The heads of the two children are well discriminated in character. Cain seems to frown in his sleep; Abel has the soft, pure lineaments which the early painters gave to the heads of the infant Christ. Eve, bending thoughtfully and fondly over them, seems to anticipate their future fate. A group of extraordinary talent and power, both in conception and treatment. The form of Eve has all the amplitude and vigour which ought to characterise the first parent; and thus Michael Angelo has represented her. On the pedestal are three small bas-reliefs from the history of the two brothers."

It is quite unnecessary for us to add anything to the above remarks, which comprehend, in a few words, the leading features of this fine group.

THE FIRST CRADLE

ENGRAVED BY W. BOFFE, FROM THE BRONZE BY A. F. DELAY

LONDON PUBLISHED FOR THE PROPRIETORS

BRITISH INDUSTRIES.

THE COMPOUND METALS EMPLOYED IN ART-MANUFACTURE.—(No. 1.)

THE household gods of the Egyptians in the days of Moses—the sculptured divinities of the Babylonian and Assyrian people—the many-headed idols of the Hindoos, carrying us back into the very infancy of the human race, were all of the same metallic composition. We find spear and arrow-heads at Nimroud, in some parts of the African desert, and scattered over Europe; we also discover tools of various kinds, especially over the Scandinavian regions and in the British Isles, similar, and curious in construction. It is not a little remarkable to find, by chemical analysis, in the pagan idol, the huntsman's arrow, the warrior's spear, and the miner's tool, precisely the same metals in combination—tin and copper, forming bronze. Our Sacred Volume informs us that Tubal Cain was "an instructor of every artificer in brass and iron;" and, in Deuteronomy, we are told that Judea was "a land whose stones are iron, and out of whose hills thou mayest dig brass." Now, we apply the term brass to a yellow metal, which is a mixture of zinc and copper. The metal, zinc, was not known to the ancients, and it is exceedingly doubtful if even the "calamine earth," which was long used to produce brass, was known even to the Romans; consequently the brass of antiquity was, without doubt, our bronze.

Agatharchidas, who wrote 180 years before Christ, informs us that the abundance of brass was such, that it formed the chief part of the domestic furniture, as well as of the chariots, the swords, the bows, and the arrows, in use in a prior age. Not long since, a great many Roman swords were found at Kingston-on-Thames in a beautiful state of preservation, and displaying great skill in their manufacture; these were all of bronze—the tin and copper being in the same unvarying proportions.

Copper appears to have been obtained by man in all ages. In the reign of the fourth Ptolemy we are told of the copper mines: "they are near the Mountain Altaki, not far from the ancient Berenice Lanchryos, in latitude 22° north; they were worked by a numerous body of people, including men, women, and children, to each of whom a portion of labour was assigned correspondent to their strength and skill. The discovery of them was made by the kings of the ancient race." The mines of Nubia appear at one time to have supplied the whole of the then known world. Cadmus, the Phœnician, is said by Strabo to have been the first to introduce the use of copper to the Greeks; and the historian tells us, that he, in the year 1594, before Christ, with a party of emigrants, opened the first copper mine in the mountain of Langæus, in Thrace.

Those Phœnician wanderers—the merchants of the world—were noted for their trade in tin, the largest portion of which they obtained from our own islands. The Cassiterides, or the Tin Islands, have been frequently stated to be the Scilly Islands; but the authority upon which this statement is made is particularly loose and unsatisfactory: one simple fact disturbs the often-repeated hypothesis—there is no tin in the Scilly Islands; there are no remains of mine-workings, nor can any evidences be detected which would appear to show that any metalliferous or mineral works ever existed in any part of that curious group of granite islands. The western promontory of Cornwall—abounding even now with tin, and over which are spread the evidences of very ancient workings—was, in all probability, intended by the ancient geographer when he described the Tin Islands of the West.

However this may be, it is evident that the

Phœnicians traded with the Britons of Cornwall for this metal. An oriental race—probably the sailors from Tyre—have left traces of their presence in Britain, which are not even yet removed; and in the tin-beds of Cornwall have been found the skulls of these adventurous orientals. The Etrurians, we are informed by Macrobius, marked out the boundary of their city with a ploughshare of copper; and it was the custom of their priests to have their hair cut with knives or razors made of copper: "these people supplied Rome with the copper from which was coined all the money which circulated in Rome through several succeeding centuries." From this it would appear probable that the Etrurians used pure copper—perhaps they were not acquainted with the process of hardening it by an admixture of tin.

We are now receiving from the sites of the great monarchies of the East, bronzes of various kinds—weapons once yielded by the Assyrian warrior—tools once employed by the industrious and skilled workmen of Babylon—casts mimicking the human form, which were revered in the temples of Baal, and others which adorned the palaces of the kings—armlets and anklets, and pins for the hair, which the women of those cities of the plain wore when they were at the height of their civilisation and luxury. Our oriental explorers, Layard, Loftus, and Rawlinson, have recovered from the deserts these memorials of ancient Art-manufacture; and the bronze of which they are composed is the same in composition as that which we employ at the present day. The copper of which they are formed was, no doubt, the produce of Arabia and Nubia; but the tin was obtained for the great empires of Egypt, Assyria, and Babylon, from the Tin Islands of the unknown Atlantic Ocean—from our own native island.

Aristotle informs us that, in his day, a mixture of tin and copper was known, which produced an alloy of the greatest density, but we nowhere find any account of a metallic alloy which corresponds with our brass. The father of natural history has, by some, been supposed to mention brass, but this is merely conjectural. Bishop Watson was of opinion that the *orichalcum* of antiquity was identical with our brass, but the evidence upon which he founds this idea is exceedingly slight.

To the manufacture of brass two things were necessary—copper and zinc. There was no scarcity of the former metal—of the latter there was none. Calamine earth (*Lapis calaminarius*) may have been known, but it is nowhere described. Long after brass had been made by melting copper in furnaces stratified with this ore of zinc, the metal zinc was unknown. Philosopher's wool, the pure *oxide of zinc*, was known to the alchemists, and exhibited as a curiosity by Brandt, and others. In all probability the chemist Brandt was the first to obtain the metal zinc.

It has been supposed by many—amongst others Dr. Pearson—that the bolts and bronze vessels which have been so frequently found in England and in Ireland, were manufactured by the natives—seeing that, in both islands, copper exists abundantly, and tin has been found. There appears, however, every reason for supposing that this was not the case; although our mines in Cumberland and Cornwall, and indeed in other mineral counties of England and Wales, were worked by our own miners, and, as it was supposed, more experienced miners from Germany, under the license of monarchs, many of whom were enriched by the treasures obtained, yet we learn only of tin, silver, and lead, as the metals obtained. In the reign of Queen Elizabeth, by an Act of Parliament, calamine earth was not allowed to be exported—as the "inexhaustible quantities of calamy would occasion much rough copper to be

brought in." This proves that the value of our copper mines was not known, and that the brass made in England, in the time of Elizabeth, was manufactured with our own calamine, but with foreign copper.

It is distinctly stated that previous to the establishment of Christianity in the Roman Empire, their architects used cast works of brass in the decoration of their public buildings. "The vaultings of many of the temples in Rome having been relieved in their lacunaria by pateræ, and other ornaments of brass. At the restoration of the Arts in the fifteenth century, and, indeed, before, most of these articles were removed for the sake of the metal, by the order of different popes, who had the most ingenious artists employed for the adornment of the many churches then erected under their auspices. Brazen monuments subsequently became exceedingly common throughout Christendom. Previous to the Reformation, large quantities of sepulchral brasses were imported into this country from the Netherlands. Few of the walls or floors of our more ancient churches failed to present some quaint portraiture—sometimes a whole family, rudely but spiritedly delineated; some fanciful cross or crozier, or some flowing label inscribed with angular letters, and carefully imbedded in stone. Some of our cathedrals were in this way ornamented with a profusion of brass garniture, to an extent which would scarcely be conceived by those who have paid no attention to the subject. The zeal which afterwards displayed itself in the destruction of popish memorials, found a ready excuse for the indulgence of cupidity in stripping away those brazen treasures, in the fact that they were the symbols or sentiments of the denounced religion. 'The cursed lust for gold,' of the Roman poet, was witnessed in respect of brass in another age and nation; rapacious lauds in this Christian country, and, under colour of a holy cause, tearing from the gravestones hundreds of sculptured brasses, will hardly be supposed to have discriminated very precisely between those which bore the offensive *orate pro anima*, and others of a more harmless but massive character. Many of these early plates, however, have been preserved; and many others have been added in subsequent years. As an example of a superior class of workmanship, the brass railings around the monument of Henry VII., in Westminster Abbey, presents a splendid specimen of the brazier's art, as displayed at a time when the knowledge of the methods of working in brass was in general but little cultivated in this country."*

Allusion has been already made to the policy of Queen Elizabeth. She granted many privileges to Daniel Houghsetter, Christopher Schutz, and some other Germans, whom she invited into England in order to instruct her subjects in the art of metallurgy. In 1565, Elizabeth granted to certain Dutch and German miners, licence to dig for alum and copperas, as well as for gold, silver, copper, and quicksilver, in several counties of England, and the English pale in Ireland. The queen granted two exclusive patents to Humphreys and Schutz, who had brought into England upwards of twenty foreign workmen, to dig and search for those metals, and also for tin and lead, and to refine the same in this country. In the same year, this monarch granted them "the sole use of the calamy stone, for composition of a mixed metal called *latten*, and all sorts of battery works, cast works, and wire." The corporation of "The Mineral and Battery Works" arose out of this: Sir Nicholas Bacon, Lord-Keeper of the Great Seal, and the Duke of Norfolk, joining the Germans in the under-

* See "Manufactures in Metal," revised by Robert Hunt; vol. iii.

taking. The brass works at Baptist Mills, near Bristol, was the first manufacture of brass established in this country; the calamine (carbonate of oxide of zinc), from the Mendip—originally Myne-deep—Hills being used.

In 1720, William Wood published a pamphlet on "The State of the Copper and Brass Manufactures of Great Britain." At that time about thirty thousand people were supposed to exist by those manufactures. The following remarks are instructive:—"We have plenty of *lapis calaminaris* for making brass. Copper ore is found in many counties of England, Wales, and Scotland: and this nation can supply itself with copper and brass of its own produce, sufficient for all occasions, if such duties were laid on foreign copper and brass as would discourage their importation, and at the same time encourage the sale of our own metal." The variations in the commercial ideas of Elizabeth's time, in the days of William Wood, and our own, when, notwithstanding the large produce of our copper mines, the importation of foreign copper ore is relieved from restrictions, are a curious and instructive study. The introduction of the manufacture of brass in Birmingham is thus described by the local historian, Hutton:—"The manufacture of brass was introduced by the family of Turner, in about 1740: they erected works at the south end of Coleshill Street. Under the black clouds which arose from this corpulent tunnel some of the trades collected their daily supply of brass; but the major part was drawn from the Macclesfield, Cheadle, and Bristol companies.

"Brass is an object of some magnitude in the trades of Birmingham (1819), the consumption is said to be one thousand tons per annum. The manufacture of this useful article has been long in the hands of a few and opulent men; who, instead of making the humble bow for favours received, acted with despotic sovereignty, established their own laws, chose their customers, directed the price, and governed the market. In 1780 the article rose, either through caprice or necessity, perhaps the former, from £72 a ton to £84. The result was, an advance upon the goods manufactured, followed by a number of counter-orders, and a stagnation of business.

"In 1781 a person, from affection to the user, or resentment to the maker, perhaps the latter, harangued the public in the weekly papers; censured the arbitrary measures of the brazen sovereigns, showed their dangerous influence over the trades of the town, and the easy manner in which works of our own might be constructed. Good often springs out of evil; this fiery match, dipped in brimstone, quickly kindled another furnace in Birmingham. Public meetings were advertised, a committee appointed, and subscriptions opened to fill two hundred shares of £100 each, which was deemed a sufficient capital; each proprietor of a share to purchase one ton of brass annually. Works were immediately erected upon the banks of the canal, for the advantage of water carriage, and the whole was conducted with the true spirit of Birmingham freedom."

It is curious, now, that so large a development has been given to the brass manufacture of Birmingham, to read thus quaintly described the history of its introduction. From what has been said, it will be evident that the art of making *bronze* is far older than the manufacture of *brass*. That the terms *brass* and *brazen* have been employed to signify both bronze (copper and tin) and brass (copper and zinc). The ancient Egyptian bronze was said to be composed of two-thirds brass and one-third copper; here we have a striking example of this confusion. The true composition of the ancient bronzes will be given in the next paper, suffice it at present to say, that the Egyptian bronzes are all tin and copper. The Corinthian brass

or bronze which has been deservedly famous, contains silver in addition. The discovery of this alloy is said to be due to the following catastrophic:—Mummius having sacked and burnt the city of Corinth, in the 158th Olympiad, it is pretended that all the metals—copper, silver, and gold—employed in ornamenting that splendid city were, by the fierceness of the fire, melted and mixed together. Three sorts of Corinthian bronze have been described, in one gold was predominant; in another, silver; and in the last, gold, silver, and copper in equal parts. In the present paper a sketch, and that only in outline, has been attempted of the History of Bronze and Brass Manufacture; in the next a description of all the varieties of these alloys will be given, and some special particulars of the modes of casting statues, bells, &c.

ROBERT HUNT.

ART IN CONTINENTAL STATES.

PARIS.—The death of M. Paul Delaroche, to which we have elsewhere referred, has caused a great sensation here in the Art-circles, to the exclusion of almost every other topic.

MUNICH.—The exhibition of Crawford's monument to the memory of Washington has been very attractive, but not more so than is justified by the merits of the work, which was shown at Miller's Foundry. The objections which have been taken to the work, by a writer in the *Allgemeine Zeitung*, are in some degree based upon truth, for it must be confessed that the sacrifices that have been made for the sake of effect are too great, yet the general impression of the statue is extremely imposing. The idea of the artist seems to be to represent Washington not only as the leader but also as the controller of the revolution; and this would appear to be expressed by the fiery impatience of the horse on one side, and the energy with which he is restrained by his rider on the other. The most favourable point of view whence the spectator can see the work is, to stand so as to view on his left; on the other side, the outlines of the horse are somewhat hard. The casting is most successful; the brilliancy of the new bronze contributes not a little to the effect of the statue.

COLOGNE.—The sum required for the completion of the Cathedral will be about 3,600,000 thalers; and, according to the calculation of the architect, the term of twelve years will be necessary for the completion of the building, with an expenditure each year of 300,000 thalers. The statement of the subscription account gives the amount of 39,637 thalers since the last general meeting, of which 30,000 thalers were, in 1855, expended in continuing the works. The total subscriptions, from the year 1842 until the end of 1855, amounts to 1,381,581 thalers, of which the greater part was contributed in subscriptions, and a portion collected by fees, &c., at the Cathedral, and from the town-treasury of Cologne.

NUREMBERG.—A proposition is circulated throughout the cities of Germany, inviting attention and contributions to a museum at Nuremberg, which has for its object the formation of a collection of antiquities in literature and Art, of any date anterior to the year 1650. The view with which this institution is founded is threefold:—1. A collection of every kind of material that can assist the history, the art, or the science of Germany; 2. a museum, library, and collection of objects of Art; 3. to render both of these departments useful and accessible, and in time to contribute to the literature of Germany, by the publication of treatises upon such subjects as may be illustrated by contributions to the collection. There are already appointed two trustees, a committee of twenty-four persons, and at the same time an extraordinary committee, comprehending 206 of the most distinguished names in Germany in literature, languages, art and antiquity; and the library will receive gratis contributions from many learned bodies, and no less than 265 booksellers, who have promised to send to it their publications. The collection contains already 3000 original subjects of antiquity; a library of nearly 18,000 volumes, among which are some very rare manuscripts; 300 sculptural works; 300 pictures, autographs, and miniatures; more than 10,000 engravings; 2000 coins and medals; 3000 seals; 2000 portraits:—all of periods anterior to 1650.

EXHIBITION OF TURNER'S PICTURES, AT MARLBOROUGH HOUSE.

A SMALL instalment of the Turner "Collection" is at length before the public at Marlborough House. There are twenty pictures of various dates, embracing a period of half a century, and exhibiting manners of viewing nature rather diverse than progressive. But time is developing Turner most satisfactorily—age is maturing and mellowing his works; many of them, even now, are in a condition more naturally qualified than when exhibited from the easel. We have employed, by the way, the word collection as we find it on the frames; but these pictures are not a collection—they have never been separated, and, therefore, have never been collected, in the manner of those galleries to which the word collection properly applies. We speak of them as if we have seen them; but we have not, because it is impossible to see pictures in Marlborough House: there is but one visible, that is, 'Childe Harold's Pilgrimage.' There were two great periods in Turner's life—the former, during which he painted what he saw; the latter, during which he painted what he imagined. The former was to him a long masquerade—we judge him as he is seen in the few pictures before us, where we find him—pardonable ambition!—emulating his master Louthborough, standing forth as now Vandervelde, now Ponsin, now Claude, now Vanderneer, nay, even Callcott. We believed that he exercised this eccentric power not in servile or unconscious imitation, but with a conviction that he could outdo those with whose feeling he might affect to sympathise. This emulation he carried perhaps into later life, when, on the walls of the Academy, he has worked a bare canvas into a picture which extinguished all others near it. His latter period was confirmed by the opening of the Continent after the war: and no sooner was he in Italy than he may be said to have suffered that *coup-de-soleil* which coloured the whole of his after-life—henceforward he asserted himself, and was Turner only. It is simply trifling to say that Turner, from his beginning, predicted his after-self; here he is before us as wearing the mantles of many men, but even with a better grace than they themselves. These magnificent works are a portion of those that are stored in the lower rooms of the Royal Academy, whence there is yet a large number to be brought forth. As we have but a brief space to devote to them, we proceed to name them, preferring their chronological succession to any importance which treatment or subject may confer on certain of them:—

1797. 'A Study at Millbank' is a small moonlight picture, admirable in finish; but we cannot accept as truth the moon shining in an even, flat, and opaque sky—our senses tell us that the moon reflects a light which illuminates the sky to a degree proportioned to the less or greater distance from the planet.

1800. 'A View in Wales.' A small dark picture, an opposition of two breadths—the land and the sky; the former distinguished by great depth and power. The detail cannot be seen.

1802. 'View on Clapham Common.' Also small, and so sketched as apparently to have been painted on the spot; and so like it that we believe the identical trees are still there.

1805. 'The Shipwreck.' This is a large picture of extraordinary power; the story is simple enough—a vessel reduced to a helpless hulk is drifting in-shore, and boats are putting off to her aid. This and Lord Yarborough's picture—'The Wreck of the Minotaur'—may be said to be pendants. This production must be regarded in two ways—to its merits as a pictorial composition, and as to the fidelity of its narrative. It is one of Turner's most sublime effusions; it is very much to say that it befits the mind for the contemplation of the reality: we know of no picture which excites emotion so overpowering. But, as to fact, these boats could not live five minutes in such a sea, they would at once be buried in such irresistible masses of water. Again, the boat that is under sail is making way with a full sheet, having the wind apparently all but dead against her.

1809. 'Greenwich Hospital.' A view from the hill, looking over the trees, and the buildings up the

river, with London, closing the distance: too high for examination, but apparently a most perfect representation of the subject.

1810. 'Abingdon, Berks.' An admirable work as far as can be seen, and unlike all others in the room.

1813. 'Cottage destroyed by an Avalanche.' The composition is not discernible.

1815. 'Bligh Sands, near Sheerness—Fishing Boats trawling.' A work of rare merit; extremely simple; the water-forms rendered in the most careful manner after nature.

1817. 'The Decline of Carthage.' One of those works on which Turner desired that his fame should rest. It is intended as a pendant to the work in the National Gallery, but it has not the substance and maintenance of parts which constitute so markedly the excellence of that work. It is full of figures, but it is impossible to read the personal story; it may be the departure or the return of Regulus. Although inferior to the other picture, it is yet a superb work—but too hot in its foreground hues, and too much broken up. The architecture is somewhat excursive.

1823. 'The Bay of Baie.' In this work will be seen the confirmation of Turner's latter system of chiaro-oscuro. As a principle, a large pine-tree is thrown up into the sky, or introduced within the composition at one third of the distance, with perhaps a counterbalance of tone and quantity on the opposite side, and these disposed with such skill as to be felt merely as accidents. This is a worthy member of the Italian series. The painter has endeavoured to give a classic emphasis to the scene, and places it before us with all the charms that attracted those Roman Sybarites (*quibus placere Baie*), the ruins of whose palaces consecrate the place to history.

1830. 'View of Orvieto' is a smaller picture, but so indifferently lighted as to render it impossible to describe it.

1832. 'Childe Harold's Pilgrimage' is, we submit, the most highly qualified of the Italian subjects. Although a composition, it is most felicitous in the adjustment of its parts. It is not falsely illumined by paint instead of light; there is unexaggerated local colour, enough to instance veritable locality; and such is the description of space, that we seem to look into the speculum of an echanter. In some other of these works we find a profitless repetition of forms; but no passage of this work could be emended by change.

1837. 'Apollo and Daphne.' The scene is a valley, bounded in the distance by the sea. On the left is a fragment of a group of trees, and removed from the foreground stands a solitary tree, to which the artist has given the power of moving mountains, so essentially does it serve the distance.

1838. 'Phryne going to the Bath as Venus.' Here the foreground is occupied by a multitudinous procession, and the background is intended to represent Athens. It is difficult to reconcile the quantity of red, not only in the figures, but also in the ground, as introduced in the most prominent portion of the picture.

1839. 'The Fighting Temeraire tugged to her last berth.' This is the best of Turner's last works; and it is much improved since it hung on the walls of the Academy. The incident is rendered profoundly touching by the sentiment with which it is invested. It is one of those works of the painter that is distinguished by so many beauties that we cannot question the propriety of anything on the canvas.

1839. 'Agrippina landing with the Ashes of Germanicus.' It is impossible to speak of this painting, as it cannot be seen.

1840. 'Venice: the Bridge of Sighs'—looking up the canal, and past the corner of the Doge's Palace, a portion of which enters the composition on the left. As an essay in chiaro-oscuro, this is a most masterly production.

The remaining works are 'The Burial of Wilkie' (1840), and 'The Sun, of Venice, going to Sea,' but these we have no space to describe. We might have examined at greater length the materials of which these works consist, as also the sentiments which they embody, but we must wait a future occasion, when they may be seen under a suitable light.

THE SOULAGE COLLECTION.

THE arrival in this country of the collection of what is called *vertu*, made by M. Soulage, of Toulouse, has excited the warmest interest of all admirers of those rare and beautiful productions of Art which are found only in the cabinets of wealthy amateurs. Great exertions, it is true, have everywhere been made, of late years, to improve public taste, and with no small measure of success. Each nation in Europe has its collection of Art-curiosities; and this has always served as a source whence to draw for reproduction and new design; and, when it was found that such possessions were a means of conferring on the utilities of life not only an artistic, but an increased mercantile value, then we awoke to the necessity of educating artists with a view to enrich with elegant form even such objects of common usefulness as might be susceptible of chaste embellishment. Much, we say, has been done; but we are still in the wake of those nations who have already, during two centuries, preceded us in their profitable attention to design. It is impossible that in ten or fifteen years we could effect as much as those countries where, for centuries, the best models have been accessible to their artists; and hence it is that we, unwilling to be second in anything, should be desirous of possessing resources for the amelioration of all those objects to which so much of the beautiful is imparted by cultivated taste. The Soulage Collection has been purchased by certain gentlemen with the honourable desire that it should become national property. The formation of the collection was commenced by its late proprietor at a time highly favourable, in Italy, to the acquisition of remnants of ancient wealth and grandeur, that is, some ten years after the tranquillisation of Europe, distracted by the long war of the French revolution. Furniture, gems, plate, jewels, lace, porcelain, enamels, bronzes, pictures, tapestries, every *genre* of Art-treasure had been dispersed, and gradually fell into the hands of dealers, who found their market among those who had a taste for these rarities and could indulge it. Thus it is that all those collections are formed. Mr. Bernal did not, perhaps, go very far from home for the majority of his catalogue; but the name of Soulage is probably still remembered in some of the least promising of these dark *botteghe*, in the narrowest and most retired streets of Florence and Rome, and, perhaps, in many of those of the secondary cities of the Italian states. But it is necessary to explain how the collection came to this country. It has been purchased for eleven thousand pounds, which sum was raised by the subscription of seventy-three gentlemen, who were patriotic enough thus to secure it, in order to submit to Parliament their purchase for ratification, that the sum might be voted to reimburse them, and so confirm the collection as national property. In the event of the purchase being declined by Parliament, the entire collection will be sold by auction, and the various sums advanced by them returned to the subscribers. Should the sale realise an amount short of the eleven thousand pounds, it will be divided in sums proportionable to the subscriptions. But it is believed that a sale by auction would produce a sum considerably above the cost of the collection—and in this case it is agreed that the surplus shall be employed in furtherance of some object promotive of Art, hereafter to be determined by a majority of the subscribers. If such an opportunity as this is lost of multiplying those sources which, to us, as the first manufacturing nation in the world, are invaluable, it is impossible to say when another such opportunity may arise; for, unlike many collections of costly toys, trifles, and mere curiosities, the greater part of the Soulage catalogue are really worthy to furnish models and suggest designs. The productions are nearly all Italian, and among them are distinguished works of the cinque-centists. We cannot suppose that the purchase will be declined, for the amount demanded for these works is altogether insignificant to a government possessed of the resources which ours has at command, and in comparison with their value, as objects of study, to the country; but, should it be so, the purchase-money might be realised by the exhibition of the collection. When it is thrown open, we propose describing it in detail in a series of articles.

MINOR TOPICS OF THE MONTH.

JOHN HENRY ROBINSON and GEORGE T. DOO have been elected associate engravers by the Royal Academy under the new law, which qualifies them for full membership. Both these gentlemen have attained high eminence; their works are well known; they have long held rank among the foremost of British engravers; but they are also considered to have quitted their profession—Mr. Robinson because he is independent of it, and Mr. Doo because he has found portrait-painting more profitable than engraving. On this account, and on this account only, we may be permitted to regret that these honours were not conferred on artists in practice, to whom they would have been more valuable acquisitions. But in Mr. Robinson and Mr. Doo, the members of the Royal Academy have associates in all respects worthy of them—gentlemen of high character and acknowledged talent.

THE WELLINGTON MONUMENT.—A correspondence on this subject has taken place between Sir Benjamin Hall and the Sculptors' Institute, to which at present we can do no more than refer. To a question as to whether the author of the best design is to be entrusted with the execution of the group, the "Chief Commissioner of Public Works" has sent the following answer:—"There is nothing in the specification to bind the government to employ the author of the best design to execute the work, and no positive obligation can be incurred."

THE MANCHESTER ART-TREASURES.—The proceedings of the Committee during the past month have been so far successful as to induce conviction that they will be compelled to reject as many pictures as they accept—the consequence will be a collection that will be really Art-treasures, for it will be unnecessary to place on the walls a single inferior work. The Soulage Collection (referred to elsewhere) is also to be exhibited there. Our anxiety now only concerns the facilities to be afforded to Art-manufacturers, British and foreign; on this subject we have received many communications, but we are at present unable to answer the questions that have been put to us. Certainly objects of modern manufacture are to be exhibited, but they must be only such as specially appertain to Art. We trust the Committee will lose no time in clearly explaining their views on this important matter, for manufacturers are in doubt as to what course they are to adopt; and if the arrangement be not soon defined, there will not be the preparations necessary for a good and effective exposition in this respect.

THE MANCHESTER MECHANICS' INSTITUTION.—The prime-minister has amply compensated for the disappointment sustained by the Institution at its inauguration. He has visited the city, and, of course, the Exhibition, and has gathered "golden opinions" in Manchester, where he was the guest of Sir Oliver Heywood, whose son is the President of the Institute. Various additions have been made to the collection, which is now described to us as in all respects admirable. We earnestly hope it will fully and entirely answer the purpose of its members.

A WINTER EXHIBITION OF PICTURES is opened at the Crystal Palace: we cannot help considering this to be "a mistake," if it be contemplated to form it of works not hitherto seen here, and if otherwise, as "a winter exhibition" it is a misnomer. There has not been time to make a new collection, and to make an inefficient gathering will be greatly to weaken such an exhibition as might have been had in the spring of next year.

THE COMPANY OF CLOTHWORKERS are about to erect a new hall on the site of their now destroyed old one, on the east side of Mincing Lane, Fenchurch Street. An engraving published in the *Builder* represents the entrance front of it, which has been designed and is about to be carried out by Mr. Samuel Angell.

THE MONUMENT TO THE LATE MARQUIS OF ORMONDE.—During the last month, the monument to this much lamented nobleman has been fixed in its appointed position in Kilkenny Cathedral, under the immediate personal direction of the sculptor, Mr. Edward Richardson. This work takes a step in advance of the memorial to the late Earl Powis by the same artist; and it does this because it shows that the fourteenth century monumental type has

been dealt with in a manner which, while it is rigidly consistent, admits both originality of conception and freedom in working out the details. The raised tomb, with its architectural enrichments and heraldic accessories, supporting the recumbent effigy, is and must remain the most perfect form of monumental memorial. The Ormonde monument is such a composition: the tomb is panelled in lozenge-shaped compartments, and it has at the angles half panels, within each of which stands the figure of an angel; the panels themselves are severally charged either with a shield or with an achievement of arms. The inscription is carried about the upper part of the composition in the chamber of the mouldings of the slab. Upon this slab rests the effigy, which is represented as habited in knightly robes, with the hands uplifted and clasped as in supplication. At the head and feet of the effigy there kneel two groups of youthful figures, three figures in each; they are the six children of the marquis, who thus cluster around his pillow and bend down at his feet. It is a beautiful and touchingly appropriate idea; and in its execution most felicitous. The portraits are admirable; the grouping and *pose* of the figures leave nothing to be desired; and the *expression* of the whole speaks for itself, and speaks home to the heart.

The simplicity and breath—essential attributes of really noble monumental sculpture—with which the figures are modelled, and the leading architectural portions of the monument expressed, are judiciously relieved by rich clusters of foliage and flowers in the spandrels of the panel-work. These accessories combine, with great “naturalness,” an appropriate and effective conventionalism. The angelic forms also claim attention—if only to show how infinitely superior in such matters is the treatment of an English sculptor to the insipid inanity which we so long were compelled to see at the Crystal Palace—four times repeated—in the so-called Scutari Monument. The chiselling of the work also deserves high commendation: it is free, earnest, and impressive throughout. We should, however, have been glad to have seen greater boldness and variety in the treatment of the heraldic accessories: but, perhaps, it will require a prolonged study, even with our ablest artists, before heraldry is practically understood and felt to be a living Art as well as a recording science. When we call to remembrance the heraldry displayed on the occasion of the funeral of the Duke of Wellington, and when we gaze at the shields of arms which seem photographed along the walls of the Palace of Westminster, we have abundant reason to feel thankful for the heraldry of the Ormonde monument.

HISTORY IN FRESCO.—A correspondent, writing to us from Rome, says that a learned Hellenist attached to the Vatican has recently made a discovery, which has its importance in reference to ancient topography, and as throwing light on a passage in the *Odyssey*. Some years ago were found beneath the foundations of a house which was demolished on the Esquiline Hill two remarkable Roman frescoes. In 1850, on taking down another house in the neighbourhood of the former, six other pictures—five of them in a state of perfect preservation—were discovered. The whole represent various episodes of the voyage of Ulysses, as related by that prince to Alcinoüs, in the *Odyssey*. These pictures are now in the Museum of the Capitol, and contribute their illustration to the solution of an historic doubt. The *savant* in question is said to find proof in the first of the series,—the subject of which is the arrival of Ulysses amongst the Lestrigons,—that, interpreting it by a verse of the *Odyssey*, it represents the neighbourhood of Terracina. This verse—the 104th of the Seventh Book—and the picture both agree with the perspective yet presented by the seaport in question, and would seem thus to clear up a point in ancient geography which has been hitherto considered obscure. It was not before certainly determined which was the port of the city of the Lestrigons.

MEETING OF THE SURREY ARCHEOLOGICAL SOCIETY AT LAMBETH PALACE.—The satisfactory fulfilment of their primary and direct objects is far from comprehending, in itself, all that our county archaeological societies are able to accomplish—for example, in addition to archaeological research and record, they may be made to lead to the opening of places otherwise not generally accessible; they may

bring together, and that periodically, many persons who otherwise might not meet; and they may popularise and extend the range of the study of archaeology. The two societies which have lately (and one of them within the last twelve months) been formed with special and exclusive reference to the archaeology of Surrey and Middlesex have at once taken an advanced position on their own peculiar ground, and they also have already effected much of what we would term secondary results. This was eminently the case on the occasion of the recent meeting of the Surrey Society at Lambeth Palace. Certainly, of the many persons who are most familiar with the old towers which rise above the Thames at Lambeth, but a very few have hitherto gone further than to desire to enter within their walls, and to examine them minutely. The palace of the archbishops of Canterbury has always been felt to be replete with spirit-stirring associations, as also to contain many things that are of the highest order of historical interest and importance; yet they were exceptional individuals, who could speak experimentally upon the subject, and could describe this Palace of Lambeth, with its contents, from their own personal knowledge of them. Accordingly, when it was announced that the Surrey Archaeological Society would hold there a general meeting, by the express permission of the present Archbishop of Canterbury, and, moreover, that the brother of his grace, the Lord Bishop of Winchester, would preside, the liveliest interest was evinced in the proposed meeting, and there prevailed the utmost anxiety to obtain admission. Unfortunately the weather on Friday, October 31st, was most unfavourable; but yet nearly 500 persons, including very many ladies, showed that it was not rain which would deter them from joining the archaeological meeting in Lambeth Palace. The meeting was held in the ancient Guard Chamber, now the Great Hall of the palace. The visitors appeared unwilling to leave any of these deeply interesting places, but the “Lollards’ Tower” was the principal point of attraction; it stands near the river, and opposite to the gatehouse, its basement forms an ante-chapel, or, rather, a species of porch to the chapel, and near its summit is a small prison-chamber, where many a noble victim, without doubt, was long immured. This chamber is reached by means of a narrow, winding turret-stair, and it is lined throughout with thick, rough planks of oak or chestnut; upon these are incised many names, mottoes, devices and brief sentences or parts of sentences; among others the motto of Cranmer—“*Nosce teipsum*,” whatever its presence here may imply, is clearly to be distinguished.

PROJECTED MONUMENTS.—The monumental expressions of public or of individual grief for the heroic dead, whose graves are far away in the Crimean solitudes, are multiplying, as we predicted they would, throughout the land. Among these, the working men of Sheffield have set on foot a movement for a monument of their own; and, with the true instinct of their class, wherever that class has been truly appealed to, the thought of the distant dead at once associated itself in their minds with the gentle ministrations which sat by so many of their dying beds. To lay the first stone of *their* memorial, the working men of Sheffield sought the hand that, in that terrible carnage, had saved so many, and done so much to soothe where it could not save. For the heroine of the ceremony which commonly consecrates a work of the kind, their hearts turned at once to Miss Nightingale. To this affectionate appeal, and the sentiment which suggested it, Miss Nightingale responds,—though not in the fashion sought. She takes the opportunity thus afforded her to read a lesson which, while it shows her own singleness of purpose, points anew the moral of how hard it is to keep even a holy work pure from all admixture of corrupting influences. Whenever the men of Sheffield shall “execute their proposed plan,” Miss Nightingale will, she says, “be with them in spirit;” but she declines to lay the foundation stone, on the ground of her wish to avoid publicity. This publicity, she adds, she considers as having impeded the work on which she was engaged, “by arousing in some minds the care for worldly distinction.”

THE ARCHITECTURAL MUSEUM.—The Committee entrusted with the direction of this important institution have determined that the lectures, for the

present session, should consist of an elementary course upon the contents of the museum itself. These lectures are now in the course of delivery on the evenings of every alternate Monday, by the Rev. Charles Boutell. In treating this subject, the lecturer classifies the various collections which form the museum, and associates with his direct descriptions of the casts themselves practical remarks upon the edifices from which they have severally been taken. Thus the students are at once and the same time familiarised with the true teaching both of the original works, and the facsimile casts from them, which form the museum. The remarkable conformity to a certain standard type, which distinguishes the details of each period in the progress of both the Romanesque and the Gothic is hence exemplified, and, at the same time, attention is directed to those distinctive peculiarities which impart to each great edifice its own individuality of character. Throughout these lectures Mr. Boutell urges the great importance to the architectural student of having placed within his reach the means and materials for instituting the widest comparison; and he shows that such comparison must always be understood to have reference as well to examples of the same details, as they were produced at or about the same time in various localities, as also to the successive changes which the advance of time developed in the same details: he also shows the necessity for dealing with mediæval architecture in the most comprehensive spirit, with the view to master its principles, and with the aim to apply those principles as the basis upon which to build up original architectural creations of our own.

We shall take occasion to advert more fully to these lectures, in consequence of the Art-teaching involved in them, when the course shall have been brought to a close: meanwhile we record, with much satisfaction, the recent accession to this museum of a fine collection of casts from the capitals of the triforium of the nave of NOTRE DAME, at Paris, together with a noble series of miscellaneous casts from Venice, these last being a contribution from Mr. Ruskin. This museum has now attained to the dimensions, and it also possesses such capabilities, as really constitute it a National Institution; it is greatly to be desired, consequently, that it should without delay be placed in a gallery that will admit of a suitable display of its contents; and we would add, that it unquestionably ought to form a component of the great National Educational Art-Collection now in the act of being gathered together by the Government at Kensington Gore.

LIVERPOOL is somewhat late in the field with its **WELLINGTON TESTIMONIAL**, and at the time when it summoned the artists into competition had not quite made up its mind as to what the character of that testimonial should be, though it is more than probable that, by our day of publication, their decision as to the work to be executed will have been taken. Their advertisement is addressed to sculptors and architects; and they have asked for designs for a column and statue, or for a column alone. The sum at their disposal at the date of their invitation was £6000; and they express their own inclination as being for the combination of column and statue, if it can be properly carried out for that amount. The designs were to be accompanied by estimates of the cost,—for the column with its statue, or for the column alone,—and by a statement of the description of material to be employed:—and a premium of £50 is offered for the best design—for which sum the design is, in any case, to be the property of the Monument Committee.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—The first meeting of the present session was held on the evening of Monday, November 3rd, in the apartments of the Institute, when the chair was occupied by Professor Cockrell, R.A.; and Professor Donaldson read the first part of an elaborate paper upon the Duke of Northumberland’s noble border-fortress and palace, Alnwick Castle. It had been intended that this entire essay should have been submitted to the Institute on the present occasion; but it was considered to be desirable to postpone the second division of it until the next meeting, in consequence of a highly interesting memoir of the Commendatore Canina, with which Professor Donaldson prefaced his paper upon Alnwick, and which elicited from the chairman and from Mr. Ashpitel warm expressions, as well of

personal friendship as of professional admiration for this remarkable and much-lamented artist. The Commandere had been very recently engaged, with Professors Cockerell and Donaldson, in preparing a series of interior decorations, which it is proposed to have executed at Alnwick, under the general direction of Mr. Salvin, the architect of the restorations; and, consequently, the name of the Signor Canina would necessarily be associated with any notice of the works at Alnwick—an association which now derives a new and painful interest from his sudden decease.

A NEW MAGAZINE, entitled the *National Magazine*, has been recently commenced, under the joint editorship of Mr. Westland Marston and Mr. John Saunders—the former a gentleman of high literary repute, the latter an editor of matured experience; it is, therefore, conducted with very great ability, and is entitled to that public support which, we understand, it receives, and without which it would be impossible for a work produced at such large cost to prosper. We refer to it chiefly because it has already given evidence that Art is to be duly considered in its pages; this is wise as well as right—the subject is becoming daily more and more interesting; there are now very few who do not desire information upon the innumerable topics in connection with it; and a journal will hereafter fail in its mission if it do not treat this theme as frequently and as extensively as it treats any other. The “want” to which we refer is, indeed, of comparatively recent date, but it is a want none the less—the belief that Art is a great teacher being now universal. Each weekly part of the *National Magazine* contains an excellent engraving on wood, from some modern picture, and is also illustrated occasionally by engraved objects of Art-industry.

THE ARCHEOLOGICAL INSTITUTE.—The first monthly meeting of the session took place on Friday, November 7th, in the apartments of the Institute in Suffolk Street, the chair being occupied by J. M. Kemble, Esq. Among other objects exhibited was a series of very excellent original architectural sketches of early architectural and monumental remains, chiefly in the county of Kent, which were exhibited by Mr. Le Keux, and are destined (with many other more important works by English artists) to be transferred to a collector in the United States. The meeting was well, though not numerously attended, and it gave promise of a session from which the cause of Art amongst us may anticipate much that is equally valuable and interesting.

PICTURE FORGERIES IN GERMANY.—The *Augsburg Gazette* some time since stated that the director of Prince Esterhazy's picture gallery, in Vienna, has been arrested on a charge of having purloined whole portfolios of very valuable engravings, and substituted inferior and worthless copies for many rare paintings. The extent of these depredations will only be made public on his trial, which, we believe, has not yet taken place. “He has only held his post a year and a half, and, as may naturally be supposed, these robberies, so cleverly imagined and so rapidly executed, have caused a great sensation in the artistic world of Austria.” We have no doubt the matter has occasioned a great stir, but it is difficult to conceive how such wholesale robberies as are here referred to could be carried on without detection even in so short a space of time as a year and a half.

GARDEN FOUNTAINS.—We have seen in progress, and near completion, in the studio of Mr. Raymond Smith, in the New Road, a design for a garden-fountain of considerable size. We feel much pleasure in calling attention to any progress in these designs, as anything were better than the style of those in Trafalgar Square. In the present instance the design is supplied by the myth of St. George and the dragon; that version of the legend which represents St. George as having rescued from the dragon, by the slaughter of the latter, a maiden who was bound to a rock to be devoured by him. The agroupment consists, therefore, of the paladin, the lady, and the dragon, the last raising its head in the agonies of death, and it is from its upraised mouth that a large column of water is projected. The work is executed in Portland stone, and we doubt not will have a good effect if advantageously situated.

REVIEWS.

ART AND NATURE AT HOME AND ABROAD. By G. W. THORNBURY, Author of “The Monarchs of the Main,” “Shakspeare's England,” &c. &c. 2 vols. Published by HURST & BLACKETT, London.

Were it our good fortune to lead a “vagrant's life” for two or three months, when we could wander hither and thither as we listed in nooks and corners of old England, on pavements worn and dingy with weary foot-treads, by broad rivers, under venerable towers, up majestic mountains, or through dim forests, we should desire no more amusing and intelligent companion than Mr. Thornbury; there would be sunshine in the heart wheresoever we were, and with whatever sky above us. Since the first appearance of Geoffrey Crayon's “Sketch-Book,” we have seen no such lively and entertaining pictures as these—pictures, moreover, of truth and life, sketched now in London, now in some ancient English mansion, in the company of beggars, in the studio of the old Dutch painter, amidst the ruins of old Rome, on the back of the Andalusian mule—everywhere, in fact, where he could pick up an idea worthy of being worked into a subject. He knows, too,—a great art in a painter,—how to adapt his treatment to his subject; his “drawing” is good; his lights and shadows are effectively distributed; his colouring is brilliant or chastened, as the case demands, and “put in” with delicacy and vigour, as either quality seems essential to the specific object on his canvas. But to drop the phraseology of the studio, which the title of the book suggests, Mr. Thornbury gives his impression of people and places with the eye of a shrewd observer, and a power of description as amusing as it is true and graphic; his volumes, we doubt not, will light up many countenances, both of old and young, during the dreary months of winter: the stories are precisely the readings for a fireside party.

A curious Hibernicism, however, attracted our attention at the end of the chapter on “Old English Mansions and Housekeepers' Stories,” where, in speaking of the love of the place of one's birth, he thus writes:—“But despise not, O Radical, the man who loves a birth-spot, where he emerged from eternity—where he saw his mother die—where he was first glorified by even a dearer love than that of a mother's—where he first heard a child call him father—where he hoped, sighed, prayed, wept, and taught—where he ran and walked, thought and wrote, married and—was buried!” We point out the error—in the consideration of a living man's feelings—that Mr. Thornbury may correct it in the next edition of his book, which, we presume, will not be long uncalled for.

PHOTOGRAPHIC ART-TREASURES. PART I. CHARTRES CATHEDRAL; THE VENUS DE MILOS. Engraved by the PHOTOGALVANOGRAPHIC PROCESS; and published by the COMPANY, Holloway Place, Islington.

If our readers will take the trouble to refer back to the July number of the *Art-Journal* for the present year, they will find a full description, by Mr. Robert Hunt, of the process by which these prints are produced; it is, therefore, unnecessary for us to do more than express our opinion of the earliest works issued by the Company, and which are enumerated above.

The PHOTOGRAPHIC ART-TREASURES contains four subjects, engraved from photographs taken by Mr. ROGER FENTON, one of the founders of the Photographic Society, and, prior to his departure for the East at the outbreak of the Russian war, its honorary secretary. The first of the four plates is a view of the street called “Lendall,” in York, terminating with the Minster, whose towers rise majestically above the houses, with all their architectural details softened down—indeed, almost obliterated—by the intervening atmosphere. The houses, especially those on which the light falls, are wonderfully truthful—every line and brick marked with extraordinary precision and delicacy; but it is not difficult to perceive where the tool of the graver has aided the effect of the camera. Plate 2, “Cedars, Monmouthshire,” is exquisitely beautiful, and forms a study for any “tree-painter.” So also is Plate 3, the “Water-gate, Raglan Castle,” where the light seems to play in very wantonness with the shadows cast by the foliage on the quiet water; and how charmingly rendered is that little passage in the distance, where the palings are seen between the overhanging trees and the “bushy” bank. The picture, as a whole, is, however, spoiled by the stiff, unpicturesque branch stretching along the upper parts, and concealing the tops of the distant trees: Mr. Fenton should, if possible, have had it

cut down before he took the photograph. Plate 4, the “Porch of Raglan Castle,” is, perhaps, the most striking picture in the series, the broad masses of light and shade rendering it most effective; while the interest of the subject is greatly heightened by the judicious introduction of some figures which give it both light and life. We detect less of the engraver's work in this plate than in the others.

The doorway of “Chartres Cathedral” is a large print, about eighteen inches by fourteen; in it we find all the architectural details and the sculptured figures copied with the most scrupulous exactness: here the hand of the engraver is very manifest upon those portions of the building and ground which catch the light. The upper portion of the arched porch does not recede sufficiently, owing to the shadow being of a uniform tint, of a depth approaching to blackness. We know not whether this could be remedied in future impressions; but it would be advisable to attempt it, as the shadow obtrudes offensively on the eye, to the injury of the other parts of the edifice.

The “Venus” comes out very finely: this is untouched by the graver, so that the effects which age and time have given to the marble are accurately preserved. The figure has been placed in an excellent position for bringing out the beauties of form and treatment for which it is so renowned.

The impression we derive from the examination of these works is, on the whole, highly favourable to the process by which they have been executed. The invention of Mr. Paul Pretsch, of Vienna, the patentee, is a wonderful stride in the Photographic Art; but we have no apprehension that, under any circumstances, it will supersede the labours of the engraver. Nature, to be pictorially represented, always requires some assistance from Art, and must come under the laws which regulate the latter.

SCENERY OF THE ENGLISH LAKES. Photographed and published by Messrs. DOLAMORE & BULLOCK, London.

Such is the increase of photographic artists, and such their activity, that we must now expect to have our “review columns” frequently occupied with reporting their progress and productions. We have before us five large views published by Messrs. Dolamore and Bullock, an “Art-firm” whose names are new to us; the scenes are taken from that picturesque locality, the English lakes. “On the Rothay, Rydal,” the first of the series we open upon, is a rich composition of mountain, tree, and stream; the whole so disposed for picturesque effect that any introduction of the painter's fancy would seem an intrusion—except a little toning down of the high lights on the lower branches of the group of trees on the right hand. “The Lower Fall, Rydal,” is not successful; it is everywhere too dark—and photography cannot produce the effect of motion in water, consequently the “Fall”—a conspicuous object in the view—is a mass of graduated colour, and nothing more. “On the Stock, Ambleside,” shows an old water-mill, from which the full stream is rushing down and winding its way amid masses of stone covered with weeds and lichen: portions of this scene “come” very truthfully as to detail, but the trees in the upper part are massed and heavy in their foliage, and imperfect in their forms. “An Old Mill, Ambleside,” is remarkable for its perfect repose: the lower half of the picture represents a deep pool of still water, reflecting in it every object on the banks with far greater depth of colour than the objects themselves, and producing thereby a most singular effect. “Rydal Water,”—the distance is beautifully represented, and would serve an artist to paint from; but the foreground is intensely heavy, so much so as to obscure all detail. The best of the series is “Lyulph's Tower, Ulleswater;” this leaves us nothing, or little, to desire more: the grey masses of stone, the dark ivy, the old yew-tree, the herbage on the ground, are vividly and distinctly pictured. Interesting as the whole of these photographs are, they are certainly unequal to many we have seen; but it is possible they may have been taken under unfavourable circumstances.

PHOTOGRAPHIC MEMORANDA. PART I. By HENRY TAYLOR. Published by HENRY HEING, London; HENRY TAYLOR, Godalming, Surrey.

Another book of Photographic Art, but of rather less ambitious pretensions than those we have just noticed. Mr. Taylor has not visited the time-honoured cathedral, rich with the work of architect and sculptor, nor the vast outspreadings of the landscape, where the eye of man sometimes can scarcely take in: he has sat himself down in the shady dingle, beneath the way-side hedge, or in the angle of a cornfield, where the summer breeze plays with the yellow stalks and bright brown ears of ripening

grain; and what a world of beauty is there not manifested in things which Nature has almost concealed from our observation, unless we look for them! We know not how his PHOTOGRAPHIC MEMORANDA may impress others, but they afford us infinitely greater pleasure than we derive from scenes generally considered of a higher order of subject-matter. How full of varied forms, and delicate markings, and graceful arrangement,—by the hand of Nature, however, not that of the artist,—is that group of fern-leaves, mingled with other wild plants as varied and as beautiful as themselves! Then comes a mass of wild hops, trailing and twisting over and around dead briars and brambles, and hedge-poles, working their way through every apparent obstacle, and filling up each crevice left in the rustic boundary wall so closely, that even a field-mouse would find some difficulty in penetrating it. A magnificent group of "burdock," flanked by nettles, and associated with a legion of the wild tribes that usually bear it company, is the subject of the next plate, and exquisitely beautiful it is. Let our ornamental designers look at it, for here is a lesson all the Schools of Practical Art in the country will never teach them, and forms which the most skilful draughtsman could never imitate in all their wonderful variety of detail, however nearly he might approach them. The last plate is a "Corner of a Wheat-field," backed by a hedge of weeds and wild plants; the stalks of the wheat, bent and broken at the extremity of the "rows," apparently by the hands and feet of those who have made a highway of the farmer's land, plucking the ears of corn as they pass. Nothing can exceed the delicacy and clearness with which these natural objects are represented. Mr. Taylor's photographs are among the best, as they are the most interesting, we have seen.

THE RIME OF THE ANCIENT MARINER. By S. T. COLERIDGE. Illustrated. Published by S. Low, Son, & Co., London.

Coleridge's singular "Rime" is here richly dressed up in blue and gold—not inappropriately uniform for an "Ancient Mariner" to make a public appearance in; but, internally, the veteran has not been so well attended to: the fault of this, however, is not altogether that of the artists to whom the "fittings" were intrusted. The poem does not contain a sufficient variety of subject-matter to diversify the illustrations, so as to make them, as a whole, acceptable. It suggests little else than a number of marine pictures, and a few figure-subjects—the latter more quaint and fanciful than agreeable. Messrs. B. Foster and E. Duncan have contributed several pretty examples of the former; and Mr. Wehnert, we doubt not, has done his best with the strange materials he had to work from; but the volume will not take its place with the many illustrated books that greet us at this season of the year.

LIFE IN ANCIENT INDIA. By MRS. SPEIR. With a Map and Illustrations, drawn on wood by G. SCHARF, Jun., F.S.A. Published by SMITH, ELDER, & Co., London; SMITH, TAYLOR, & Co., Bombay.

The dominion of England over the vast territory of India is one of those marvellous records in the history of nations that almost defies the calculations of reason. Great conquerors have seized upon countries, and retained them for a time in their grasp, by the terror of their names and the magnitude of the armies that were employed to hold them in subjection; powerful monarchs have added neighbouring yet weaker states to their own lawful possessions: but that a company of merchants, living in a far distant island, should have been able to aggrandise to themselves, and extend their influence over, immense territories, teeming with wealth and population—holding them too chiefly by means of armies gathered from among that population—is, so to speak, a political enigma, the solution of which is difficult to explain. There is, moreover, another fact connected with our rule in India, almost as extraordinary as our hold of the country:—that, deeply interested as we at home are in our Eastern possessions, numerous as are the families throughout Great Britain who have relatives and friends resident therein, we yet know comparatively little of the history of the country, past or present, or of its social condition now or in former times. Mrs. Speir's volume supplies much valuable information on the early social, moral, and religious character of the natives of British India. After an introduction descriptive of the natural features of the country, and of the characteristics of the people,

the author divides her subject into three divisions:—the first describes it previously to the time of Alexander the Great; the second book treats of Buddhism—a "religion which bears an external perverted kind of resemblance to Christianity, giving a peculiar interest to the circumstances under which it was developed;" the third book returns to Brahmanism, giving a notice of "the poems, dramas, and *puranas*—beautiful, absurd, fanciful—which were produced subsequent to the era of Alexander." This brings the history down to the time when the Mohammedans began their conquests in the country, at which period Mrs. Speir closes her narrative, after a short inquiry as to the success which attended Brahminical regulations and Buddhist theories. It is a strange, romantic story, but no less interesting than it is strange; truth and fable seem to be so interwoven in it as to have become inseparable; while the poetical quotations now sparkle with the brilliancy of India's own native gems, and now are fragrant with the perfume of her flowers. Mr. Scharf's illustrations, gathered from authentic sources, are useful addenda to the writer's descriptions of places and objects.

MEMORIALS OF JAMES WATT. By GEORGE WILKINSON, Esq. Printed for the Watt Club, by THOMAS CONSTABLE, Edinburgh.

What the lives of Alexander, Caesar, Marlborough, Wellington, Napoleon, and other great warriors are to the student of military history, those of Davy, Watt, and a host more of a similar order, will prove to such as delight in the records of men whose names are famous in the arts of peace,—biographies that will serve as incentives to urge on the young mind along the highway of scientific pursuit; examples enforcing the principles and practice of industry, thoughtful labour, and diligent research. This memoir of the greatest mechanician of the age will be read with interest and avidity by congenial minds. We see the lad in the midst of the benches of his father's workshops, at Greenock, busy with chisels and tools, "ardent in the construction of model-works and machines;" we follow him to Glasgow, settled in that city as a mathematical instrument-maker, where his work-room became "a little University"—"a kind of Academy," as M. Arago remarks, "whither all the notabilities of Glasgow repaired to discuss the nicest questions in Art, Literature, and Science." "Those," says his biographer, "were the hours of the young artist's most serious and most varied study, all-essential, doubtless, to the future of the great inventor. But—though standing, apparently, as it were on the very threshold of that after-fame—the die of the youth's life is not yet finally cast." We must refer our readers to the volume itself, if they desire to become acquainted with the circumstances of Watt's subsequent career and triumph: his genius is inscribed in the chronicles of his country, while the stupendous results of his labours have contributed to enrich her, and benefit the whole world: the STEAM-ENGINE has proved the mighty lever which has changed the whole surface of the earth and her inhabitants.

THE FIVE GATEWAYS OF KNOWLEDGE. By GEORGE WILSON, M.D., F.R.S.E. MACMILLAN & Co., Cambridge.

We have frequently, now-a-days, little quaint volumes bearing on the present taste, not only of mediæval ornament, but mediæval thought—picturesque modes of treating material things, adding beauty to reality—the illumination of the missal. Our readers will readily understand that "The Five Gateways of Knowledge," are the five senses; and we assure them that their operation and influence have been treated by Dr. Wilson so as to create and satisfy inquiry: this precious little volume should find a resting-place on every public and private table in the realm.

MARIAN FALCONER; OR, STARS IN DARKNESS. By E. H. W. BINNS & GOODWIN, Bath.

MARIAN FALCONER cannot be considered a book for the young, though it abounds in youthful characters. The author is peculiarly happy in delineating the thoughts and feelings of youth, and yet has abundant strength to wrestle with the passions and struggles of more matured existence. The story would be more effective if it were "closed in" the machinery is too large and elaborate; the characters too numerous; the author crowds her canvas, and this renders what would be valuable

and clear in two pages, tedious and confused in four. The popularity of the "Wide, wide World" has in a great degree rendered this overcrowding fashionable; but it is no less a fault, and becomes dangerous to authors who, like E. H. W., are gifted with a sort of miniature-painting power in the delineation of character. There are ample materials in MARIAN FALCONER for three or four tales; but it creates a vivid interest for its principal characters, and we can recommend it as a pure and earnest book, faithful to its purpose.

THE ROYAL CRYSTAL PALACE ALMANAC FOR 1857. Published by ARTHUR HALL, VIRTUE, & Co., London.

This is the first of the Almanacs for the forthcoming new year which has reached us, and we greatly mistake the taste of the public if it does not become the first in their good opinion; for it is ornamented with very beautiful designs emblematical of the twelve months of the years, and of the four seasons—the same designs that attracted so much attention in our pages four or five years since, and which, being now collected, and following each other in consecutive pages, instead of being scattered as they were when formerly published, derive new charms from their mutual association. The letter-press affords the usual amount of information one naturally looks for in an almanac, besides an ample notice of the Crystal Palace and its contents, sufficient to justify the title given to the almanac by the publishers; while, as a frontispiece to the book, is an elegant engraving from a piece of sculpture. This is, in the true sense of the term, an Art-almanac, and a marvellously cheap shilling's worth of Art too.

ON THE SECURITY AND MANUFACTURE OF BANK-NOTES. By HENRY BRADBURY, M.R.I. Published by BRADBURY & EVANS.

In a great commercial country like our own the genuineness of the circulating medium is a matter of the highest importance. Mr. Henry Bradbury, having turned his attention to the subject, recently delivered a lecture at the British Institution upon that portion of it which refers to the manufacture of bank-notes, and has printed and published the lecture, with engraved specimens of notes he would substitute for those now in use. The subject is well handled; and his specimens are certainly beautiful in design, and admirable examples of engraving and printing. He tells us, from the best authorities, that the forgery of bank-notes is greatly on the increase. We should think it almost impossible to copy these without detection, even with all the aids which science, in the form of photography and the Anastatic process, might offer to the forger.

OUTLINES OF ENGLISH HISTORY. By HENRY INCE, M.A.—OUTLINES OF DESCRIPTIVE GEOGRAPHY. By PROFESSOR WALLACE. Published by J. GILBERT, London.

Two well-digested and comprehensive little books, each containing a large sum of information crowded into a small space: they are modestly called "Outlines," but there is enough filling in of the sketch to render the outlines really valuable in the work of education. The English history has so far met with the approval of the Educational branch of the Society of Arts as to be adopted by it in the examination of the prize students.

THE STUDIO OF RAUCH.—HUMBOLDT IN HIS LIBRARY. Published by A. SCHLOSS, 10, Portman Street, London.

A pair of German coloured lithographs, the subjects of which are explained in their titles. The great sculptor is surrounded by the models of his principal work; the "travelled" philosopher is writing in the midst of his books and maps. The portrait of each is good: and the accessories of the pictures carefully drawn, and artistically grouped.

POETICAL TENTATIVES. By LYNN ERITH. Published by SAUNDERS & ORLEY, London.

This little book contains a goodly gathering of sweet and pleasant thoughts, far removed beyond the commonplace fancies that pervade most of the fugitive poetry of the day; and the thoughts are musically and melodiously expressed. Lynn Erith—a *nom de plume*, we suppose—has an ear for harmonious sounds, and a heart susceptible of gentle musings. He has not mistaken the gifts nature has bestowed upon him, nor does he misapply them.

FINIS.
